## PREFACE

THE NEW INTERNATIONAL YEAR BOOK with its comprehensive record for the year 1929, is the twenty-eighth volume of a series that has enjoyed general favor and long since has become established and appreciated as an annual work of reference. In the present volume there are few departures from a plan that has been found most convenient for ready reference and particularly useful to the general reader. The NEW INTERNATIONAL YEAR BOOK, true to its title, as usual presents an adequate picture of international conditions in politics, literature, art, and science, with special reference to interrelated movements and developments in various fields.

A few of the more important features may be cited in this preface as of more than passing interest. In world politics the year 1929 has been replete with interest. The LEAGUE OF NATIONS has functioned with increased efficiency. After a conference at The Hague the Young Plan for the settlement of the delicate question of REPARATIONS was formulated; while in South America the Tacna-Arica question, outstanding for many years, was settled by Chile and Peru as discussed under INTERNATIONAL ARBITRATION. On the other hand during the year relations between BOLIVIA and PARAGUAY continued strained and aroused the general concern of American states. The liberal tendency of the times was reflected in Labor governments coming into power in GREAT BRITAIN and AUSTRALIA; while in JAPAN a Liberal Ministry headed by Premier Hamaguchi of the Minseito Party assumed responsible government. INDIA continued in a state of political unrest with various movements under way portentous of future trouble; while in the UNION OF SOUTH AFRICA an important general election was held. Somewhat distinct from liberal advances is the record of political conditions in ITALY, including the notable ratification of the treaty with the Vatican and the establishment of VATICAN CITY as an independent Papal State. Under CHINA the confused situation due to the Manchurian railway and other questions are discussed with the hope of simplifying for the reader of the news of the day the political complexities of this Eastern republic. The question of disarmament was prominent in world politics and received an impetus in the action of DENMARK and in movements in NORWAY and SWEDEN toward reducing their military and naval forces, in addition to the regular organized PEACE efforts which continued as in previous years. Naturally this involved a consideration of MILITARY PROGRESS and NAVAL PROGRESS with due attention to developments in these fields.

The YEAR BOOK continues its record of PROHIBITION in the United States as well as elsewhere, and the record for 1929, especially when read in connection with that given in previous volumes, forms a comprehensive view of the progress of this much debated phase of governmental activity which confessedly had not passed from the experimental stage. But Prohibition was by no means the only form of political activity of importance in the UNITED STATES and the progress of Farm Relief and Tariff Revision is chronicled, including the passage of the Agricultural Marketing Act and the establishment of the Federal Farm Board with the development of cooperative effort on the part of the farmers.

In no field has the YEAR BOOK been found more useful than in its summaries of the literary activity of the year, not merely in the United States and Great Britain, but

## PREFACE

in France, Germany, Italy, Scandinavia, and Spain, with due attention to the literatures of Spanish America. For the present volume an unusually interesting summary of the THEATRE has been prepared. ART and ARCHITECTURE continue to receive the attention they merit, with special consideration given to European conditions and developments as well as to notable work in America. The social sciences receive customary treatment with such topics as CHILD WELFARE, COOPERATION, CRIME, IMMIGRATION, LABOR LEGISLATION, MARRIAGE AND DIVORCE, OLD AGE PENSIONS, and UNEMPLOYMENT, indicating the range of a department which keeps the reader fully in touch with movements related to human activities and welfare. No recent development in the YEAR BOOK has been more cordially received than the department of finance and commerce, dealing as it does with applied economic and business conditions. Of particular interest under BANKS AND BANKING, BUSINESS REVIEW, and FINANCIAL REVIEW, is a discussion of financial conditions including the Panic of October which was so startling in its apparent suddenness and immediate consequences.

The authoritative review of PHOTOGRAPHY presented in the previous YEAR BOOK has been continued, and this year there is included a discussion of MOVING PICTURES with a full consideration of the changes that the combination of talking features has brought to this art and industry. In CHEMISTRY the usual interesting summary is submitted, while under GEOLOGY a new contributor records the developments of the year. Under AERONAUTICS the YEAR BOOK summarizes the interesting developments in this ever-progressing art and now general means of communication. In mechanical and power engineering new and important power plants and units are described, including INTERNAL COMBUSTION ENGINES, ranging from those for the motor vehicle to the largest ship. Whether considered from the engineering or economic standpoint the progress of the AUTOMOBILE warrants the careful attention it receives in the YEAR BOOK. Not only must problems involved in changes of design be treated, but as one of the world's leading industries it must be considered in relation to life and civilization as expressed in financial relations, highway improvements, public safety and taxation, with appropriate legislative and administrative conditions involved under one or more of these heads.

The YEAR BOOK contains no single article on religious progress, yet this important subject is fully discussed in important and authoritative summaries of the activities of the various churches and religious denominations. In the preparation of these articles the editors of the YEAR BOOK have received the gracious cooperation of leaders of religious bodies. The same holds true for education, and in addition to the general article on EDUCATION IN THE UNITED STATES and UNIVERSITIES AND COLLEGES each of the important institutions is considered with significant statistics as of the autumn of 1929. The reader of the YEAR BOOK will note a somewhat increased NECROLOGY with the biographical sketches of important men and women who died during the year, some of these, of course, finding treatment in the main body of the book.

In conclusion, as in previous years, the Editor desires to record his cordial thanks for the kind and effective cooperation of many governmental agencies in various parts of the world who have placed at his disposal their most recent official statistics and other information. Likewise, unofficial but important organizations in letters, science and arts, not to mention countless individuals, have rendered valuable assistance in the volume that is herewith presented.

HERBERT TREADWELL WADE.

# EDITOR HERBERT TREADWELL WADE LIST OF CONTRIBUTORS

**AGRICULTURE; AGRICULTURAL EXPERIMENT STATIONS; COTTON; TOBACCO**  
HENRY M. STEECE, B S (AGR), A M,  
SPECIALIST IN AGRONOMY, OFFICE OF EXPERIMENT STATIONS, UNITED STATES DEPARTMENT OF AGRICULTURE

**AGRICULTURAL EXTENSION WORK**  
REUBEN BRIGHAM,  
SENIOR AGRICULTURIST, IN CHARGE OF VISUAL INSTRUCTION AND EDITORIAL WORK, OFFICE OF COOPERATIVE EXTENSION WORK, EXTENSION SERVICE, UNITED STATES DEPARTMENT OF AGRICULTURE

**AGRICULTURAL LEGISLATION**  
HOWARD L. KNIGHT,  
OFFICE OF EXPERIMENT STATIONS, UNITED STATES DEPARTMENT OF AGRICULTURE

**ANTHROPOLOGY (WITH ETHNOLOGY)**  
LESLIE SPIER, PH D,  
PROFESSOR OF ANTHROPOLOGY, UNIVERSITY OF WASHINGTON, AND DIRECTOR OF WASHINGTON STATE MUSEUM

**ARCHAEOLOGY**  
OLIVER SAMUEL TONKS, PH D,  
PROFESSOR OF ART, VASSAR COLLEGE

**ARCHITECTURE**  
TALBOT F. HAMLIN,  
MEMBER OF AMERICAN INSTITUTE OF ARCHITECTS

**ASTRONOMY; METEOROLOGY; EARTHQUAKES; FLOODS; SEISMOLOGY**  
EDGAR W. WOOLARD, PH D,  
DEPARTMENT OF MATHEMATICS, GEORGE WASHINGTON UNIVERSITY

**AUTOMOBILES**  
HENRY R. COBLEIGH, M E,  
SECRETARY OF SERVICE, NATIONAL AUTOMOBILE CHAMBER OF COMMERCE

**BIOGRAPHY**  
FRANCES N. CHRYSTIE,  
SARAH REDWINE, A M.

**BOTANY**  
CHARLES L. POLLARD, A M

**CHEMISTRY; EXPOSITIONS; CELEBRATIONS**  
MARCUS BENJAMIN, PH D, Sc D, LL D,  
EDITOR FOR THE UNITED STATES NATIONAL MUSEUM

**CIVIL ENGINEERING**  
JAMES K. FINCH, C E,  
PROFESSOR OF CIVIL ENGINEERING, COLUMBIA UNIVERSITY

**CROP PRODUCTION; UNITED STATES DEPARTMENT OF AGRICULTURE**  
JOHN I. SCHULTE,  
OFFICE OF EXPERIMENT STATIONS, UNITED STATES DEPARTMENT OF AGRICULTURE

**DAIRYING; LIVESTOCK; WOOL**  
GEORGE HAINES, B S, M S, PH D,  
SENIOR ANIMAL HUSBANDMAN, OFFICE OF EXPERIMENT STATIONS, UNITED STATES DEPARTMENT OF AGRICULTURE

## DRAMA AND THEATRE

BURNS MANTLE,  
DRAMATIC EDITOR, *Daily News*, NEW YORK;  
EDITOR, *Best Plays and Year Book of the Drama in America* SINCE 1910

**ECONOMIC ENTOMOLOGY; VETERINARY MEDICINE**  
WILLIAM A. HOOKER, B Sc, LL M, D V M,  
OFFICE OF EXPERIMENT STATIONS, UNITED STATES DEPARTMENT OF AGRICULTURE

**ECONOMIC, SOCIAL, AND POLITICAL SCIENCE SUBJECTS**  
LOUIS M. HACKER, A M

**EDUCATION; UNIVERSITIES**  
MILIO B. HILLEGAS, PH D, LL D,  
PROFESSOR OF EDUCATION, COLUMBIA UNIVERSITY

**ELECTRICAL ENGINEERING SUBJECTS AND RADIO COMMUNICATION**  
WALTER I. SLICHTER, E E,  
PROFESSOR OF ELECTRICAL ENGINEERING, COLUMBIA UNIVERSITY

**EUROPEAN HISTORY AND GAZETTEER**  
RONALD S. KAIN,  
OFFICE EDITOR

**EXPLORATION; POLAR RESEARCH**  
MARGARET WARTHIN, M S

**FERTILIZERS AND SOILS**  
ROBERT W. TRULLINGER, C E,  
ASSISTANT IN EXPERIMENT STATION ADMINISTRATION, SENIOR AGRICULTURAL ENGINEER, OFFICE OF EXPERIMENT STATIONS, UNITED STATES DEPARTMENT OF AGRICULTURE

**FINANCIAL REVIEW; BANKS AND BANKING; BUSINESS REVIEW; PUBLIC FINANCE; TAXATION**  
H. PARKER WILLIS, PH D,  
EDITOR, *The Journal of Commerce*, NEW YORK;  
PROFESSOR OF BANKING, COLUMBIA UNIVERSITY.

**FOOD AND NUTRITION; VITAMINS**  
SYBIL L. SMITH,  
ASSISTANT IN EXPERIMENT STATION ADMINISTRATION, HOME ECONOMICS, OFFICE OF EXPERIMENT STATIONS, UNITED STATES DEPARTMENT OF AGRICULTURE

**FORESTRY AND HORTICULTURE**  
JOSEPH W. WELLINGTON,  
HORTICULTURIST, OFFICE OF EXPERIMENT STATIONS, UNITED STATES DEPARTMENT OF AGRICULTURE

**FRENCH LITERATURE**  
ALBERT SCHINZ, PH D,  
PROFESSOR OF ROMANIC LANGUAGES AND LITERATURES, UNIVERSITY OF PENNSYLVANIA

**GEOLOGY**  
WILLIAM M. AGAR, M S, PH D  
PROFESSOR OF GEOLOGY, COLUMBIA UNIVERSITY.

**GERMAN LITERATURE**  
AMELIA VON ENDE.

**INSURANCE**  
WILLIAM S. CRAWFORD,  
INSURANCE EDITOR, *The Journal of Commerce*, NEW YORK

**ITALIAN LITERATURE**

O. A. BONTEMPO, PH C,  
ROMANCE LANGUAGE DEPARTMENTS, COLUMBIA  
UNIVERSITY AND NEW YORK UNIVERSITY; DI-  
RECTOR, ITALICA ASSOCIATION OF AMERICA;  
EDITORIAL STAFF, *Romano Review*

**INTERNATIONAL ARBITRATION; IN-  
TERNATIONAL LAW; LEAGUE OF NA-  
TIONS; WORLD COURT; PEACE MOVE-  
MENTS; ETC.**

CLINTON ROGERS WOODRUFF, LL.D.,  
HONORARY SECRETARY OF THE NATIONAL MU-  
NICIPAL LEAGUE AND MEMBER OF THE MOHONK  
CONFERENCE, FORMERLY PRESIDENT OF THE  
BOARD OF PERSONAL REGISTRATION, PHILADEL-  
PHIA.

**LABOR LEGISLATION**

JOHN B. ANDREWS, PH.D.,  
SECRETARY OF THE AMERICAN ASSOCIATION FOR  
LABOR LEGISLATION AND EDITOR, *American  
Labor Legislation Review*.

**LITERATURE, ENGLISH AND AMERI-  
CAN**

WILLIAM BENFIELD PRESSEY, A.M.,  
ASSISTANT PROFESSOR OF ENGLISH, DARTMOUTH  
COLLEGE.

**MEDICAL SUBJECTS**

EDWARD PREBLE, M.D.

**METALLURGY**

EDWARD HODGES ROBIE,  
ASSOCIATE EDITOR, *Engineering and Mining  
Journal*

**MILITARY PROGRESS**

JOHN J. BRADLEY,  
COLONEL, INFANTRY, UNITED STATES ARMY,  
RETIRED.

**MINERALOGY**

HERBERT P. WHITLOCK, C.E.,  
CURATOR, DEPARTMENT OF MINERALOGY, AMERI-  
CAN MUSEUM OF NATURAL HISTORY, NEW YORK  
CITY

**MINERAL PRODUCTION**

S. D. STRAUSS,  
ASSISTANT EDITOR, *Engineering and Mining  
Journal*

**MOVING PICTURES**

RICHARD WATTS,  
EDITORIAL DEPARTMENT, *New York Herald  
Tribune*

**MUSIC**

ALFRED REMY, M.A.,  
EDITOR, *Baker's Biographical Dictionary of  
Musicians*, FORMERLY EXTENSION LECTURER,  
COLUMBIA UNIVERSITY, AND LECTURER ON THE  
HISTORY OF MUSIC, NEW YORK COLLEGE OF  
MUSIC.

**NAVAL PROGRESS AND RELATED SUB-  
JECTS**

LEWIS SAYRE VAN DUZER,  
CAPTAIN, UNITED STATES NAVY, RETIRED, WRITES  
ON NAVAL AND NAUTICAL SUBJECTS.

**PAINTING AND SCULPTURE**

JEAN LEONARD,  
ASSISTANT, EDITORIAL DIVISION, METROPOLITAN  
MUSEUM OF ART.

**PHILOLOGY (CLASSICAL)**

CHARLES KNAPP, PH.D.,  
PROFESSOR OF GREEK AND LATIN, BARNARD COL-  
LEGE, COLUMBIA UNIVERSITY, MANAGING EDITOR,  
*The Classical Weekly*.

**PHILOLOGY (MODERN)**

JOHN LAWRENCE GERIG, PH.D., LITT.D.,  
AD. HON. (UNIVERSITY OF BOME); PROFESSOR  
OF CELTIC, EXECUTIVE OFFICER, DEPARTMENT OF  
ROMANCE LANGUAGES, COLUMBIA UNIVERSITY;  
HONORARY DIRECTOR, DEPARTMENT OF SPANISH  
STUDIES, UNIVERSITY OF PORTO RICO; CAVA-  
LIERE DELLA CORONA D'ITALIA; CHEVALIER DE LA  
LEGION D'HONNEUR; EDITOR, *Romano Review*,  
ETC.

**PHILOSOPHY**

V. JERAULD MCGILL, PH.D.,  
LECTURER AT COLUMBIA UNIVERSITY AND HUNTER  
COLLEGE.

**PHOTOGRAPHY**

GLENN E. MATTHEWS, M.S.C.,  
TECHNICAL EDITOR, KODAK PARK RESEARCH LAB-  
ORATORIES, ROCHESTER, N. Y.

**PHYSICS**

HENRY D. HUBBARD,  
SECRETARY, UNITED STATES BUREAU OF STAND-  
ARDS.

**POWER ENGINEERING; POWER  
PLANTS; ETC.**

ALFRED D. BLAKE, M.E.,  
ASSOCIATE EDITOR, *Power*

**PSYCHICAL RESEARCH**

WALTER FRANKLIN PRINCE, PH.D.,  
RESEARCH OFFICER, THE BOSTON SOCIETY FOR  
PSYCHICAL RESEARCH

**PSYCHOLOGY**

ALBERT T. POFFENBERGER, PH.D., SC.D.,  
PROFESSOR OF PSYCHOLOGY, COLUMBIA UNIVER-  
SITY

## KEY TO PRONUNCIATION

- E** as in *ale, fate*. Also see **ē**, below.
- ā** " " *senate, chaotic*
- ā** " " *glare, care, and as e in there* See **ē**, below.
- ē** " " *am, at.*
- ē** " " *arm, father*
- ā** " " *ant, and final a in America, armada, etc.*  
In rapid speech this vowel readily becomes more or less obscured and like the neutral vowel or a short *u* (**ū**)
- ē** " " *final, regal, where it is of a neutral or obscure quality.*
- ae** " " *all, fall*
- ē** " " *eve.*
- ē** " " *elate, evade.*
- ē** " " *end, pet.* The characters **ē**, **ā**, and **ā** are used for *a, ae* in German, as in Baedeker, Grafe, Handel, to the values of which they are the nearest English vowel sounds. The sound of Swedish *a* is also sometimes indicated by **ē**, sometimes by **ā** or **ā**
- ē** " " *fern, her, and as i in sir* Also for *o, oe*, in German, as in Gothe, Goethe, Ortel, Oertel, and for *eu* and *oeu* in French, as in Neufchâtel, Crèveœur; to which it is the nearest English vowel sound
- o** " " *agency, judgment, where it is of a neutral or obscure quality.*
- i** " " *ice, quiet*
- i** " " *quiescent.*
- i** " " *ill, fit*
- o** " " *old, sober.*
- o** " " *obey, sobriety.*
- o** " " *orb, nor*
- o** " " *odd, forest, not*
- o** " " *atom, carol, where it has a neutral or obscure quality*
- oi** " " *oil, boil, and for eu in German, as in Feuerbach*
- oo** " " *food, fool, and as u in rude, rule.*
- ou** " " *house, mouse.*
- ū** " " *use, mule*
- ū** " " *unite*
- ū** " " *cut, but*
- ū** " " *full, put, or as oo in foot, book.* Also for *u* in German, as in Munchen, Muller, and *u* in French, as in Buchez, Budé, to which it is the nearest English vowel sound
- ū** " " *urn, burn*
- y** " " *yet, yield*
- z** " " *the Spanish Habana, Córdoba, where it is like a v made with the lips alone, instead of with the teeth and lips.*
- ch** " *chair, cheese.*
- D** as in the Spanish *Almodovar, pulgada*, where it is nearly like *th* in English *then*, this.
- g** " " *go, get*
- g** " " *the German Landtag, and ch in Feuerbach, buch;* where it is a guttural sound made with the back part of the tongue raised toward the soft palate, as in the sound made in clearing the throat.
- h** " " *j in the Spanish Jijona, g in the Spanish gila, where it is a fricative somewhat resembling the sound of h in English hue or y in yet, but stronger*
- hw** " *wh in which*
- x** " *ch in the German ich, Albrecht, and g in the German Arensburg, Mecklenburg, where it is a fricative sound made between the tongue and the hard palate toward which the tongue is raised. It resembles the sound of h in hue, or y in yet, or the sound made by beginning to pronounce a k, but not completing the stoppage of the breath. The character x is also used to indicate the rough aspirates or fricatives of some of the Oriental languages, as of kh in the word Khan.*
- z** " " *in sinker, longer.*
- ng** " " *sing, long*
- n** " " *the French bon, Bourbon, and m in the French Etampes, where it is equivalent to a nasalizing of the preceding vowel. This effect is approximately produced by attempting to pronounce "onion" without touching the tip of the tongue to the roof of the mouth. The corresponding nasal of Portuguese is also indicated by n, as in the case of São Antão.*
- sh** " " *shine, shut*
- th** " " *thrust, thin.*
- th** " " *then, this*
- zh** " *z in azure, and s in pleasure*  
An apostrophe ['] is sometimes used to denote a glide or neutral connecting vowel, as in *tā'b'l* (table), *kāz'm* (chasm).
- Otherwise than as noted above, the letters used in the Russian for pronunciation are to receive their own English sounds
- When the pronunciation is sufficiently shown by indicating the accented syllables, this is done without repelling, as in the case of very common English words, and words which are so spelled as to insure their correct pronunciation if they are correctly accented. Pronunciation is discussed in the *NEW INTERNATIONAL ENCYCLOPEDIA*.

**ABORTION IN LIVESTOCK.** See VETERINARY MEDICINE

**ABYSSINIA.** See ETHIOPIA

**ACADEMY, FRENCH** (ACADÉMIE FRANÇAISE). The oldest of the five academies which make up the Institute of France and officially considered the highest, founded in 1635, reorganized in 1816. The membership is limited to 40. The list of the Immortals at the beginning of 1929, in order of their election, was as follows: Paul Bourget, Gabriel Hanotiau, Henri Lavedan, René Bazin, Maurice Donnay, Raymond Poincaré, Eugène Brieux, René Doumic, Marcel Prévost, Henri de Régnier, le maréchal Louis Lyauté, Pierre de La Gorce, Henri Beigson, le maréchal Joseph Joffe, Louis Barthou, Mgr. Alfred Baudrillat, Jules Cambon, Georges Clémenceau (died Nov 24, 1929), le maréchal Ferdinand Foch (died Mar 20, 1929), Henri Bordeaux; Joseph Bédier, André Chevrillon; Pierre de Nolhac, Georges Goyau, Henri Bémond, Georges de Porto-Riche, Edouard Estaunié, Henri Robert, Camille Jullian, Georges Lecomte, Émile Picard, Albert Bernard, Louis Bertrand, Auguste de Caumont, duc de La Force, Paul Valéry, Abel Hermant, Émile Mâle, Louis Madelin, and Maurice Paléologue.

Louis Madelin, the historian, who was elected to membership in the academy in 1927 to fill the chair formerly occupied by Robert de Flers, was formally received during the year. On June 20, Marshal Henri Pétain was elected to fill the place made vacant by the death of Marshal Foch. Marshal Pétain was born in Cauchy à la Tour in 1856 and received his military education at the École Supérieure de Guerre. During the World War, he greatly distinguished himself on the occasion of the French offensive near Arras in May, 1915, where his corps broke through the German position, and it was largely owing to his energy that Verdun was saved during the German offensive of the spring of 1916. In April, 1917, he was appointed chief of the general staff of the Ministry of War and a few weeks later replaced General Nivelle as commander-in-chief of the armies in the field. He received the baton of Maréchal de France from President Poincaré at Metz on Dec. 8, 1918.

At the academy's June meeting, the ballot was inconclusive as to the successor to the seat formerly occupied by Viscount François de Curel, Charles Le Goffic and François de Croisset being close contestants. The academy's *Grand Prix de Littérature* was awarded in June to Henri Massis. See FRENCH LITERATURE. The salaries of

the academicians were raised by the French Parliament to 5000 francs a year. The permanent secretary of the academy was René Doumic.

**ACADEMY OF ARTS AND LETTERS, AMERICAN.** A society founded in 1904 by members of the National Institute of Arts and Letters, its charter of incorporation being approved by Act of Congress Apr. 17, 1916. It corresponds to the French Academy, its membership being limited to 50 chairs, and vacancies caused by death are filled by election by the members from the National Institute on the basis of lifetime achievement in literature, painting, sculpture, architecture, and music.

The twenty-fifth anniversary of the founding of the academy was observed on Apr. 23, 1929 in connection with the formal session held on that date, the gold medal of the academy for distinction in literature was awarded to Edith Wharton, the medal for good diction to Julia Marlowe, and the new medal for good diction over the radio to Milton J. Cross. On April 24, Prof. George Pierce Baker of Yale University, a member of the academy, read a paper, "The Modern English Language", and on the evening of the same day, the third concert of all American music by American composers was given by the Philharmonic-Symphony Orchestra, under the auspices of the academy, at Carnegie Hall. An exhibition of memorabilia of members of the academy, living and deceased, also was held in connection with the twenty-fifth anniversary. The annual meeting scheduled for November, 1929, was postponed to November, 1930, owing to the fact that the new academy building, facing 156th Street near the site of the headquarters building, was in process of erection.

The membership of the academy, as of Dec. 1, 1929, consisted of the following in the order of their election: Daniel Chester French, Robert Underwood Johnson, Henry van Dyke, Arthur Twining Hadley, Edwin Howland Blashfield, George Edward Woodberry, George Whitefield Chadwick, George de Forest Brush, Bliss Perry, Abbott Lawrence Lowell, Nicholas Murray Butler, Owen Wister, Herbert Adams, Augustus Thomas, Timothy Cole, Cass Gilbert, Robert Grant, Frederick MacMonnies, William Gillette, Paul Elmer More, Gari Melchers, Elihu Root, Brand Whitlock, Hamlin Garland, Paul Shorey, Charles Adams Platt, Archer Milton Huntington, Childs Hassam, David Jayne Hill, Lorado Taft, Newton Booth Tarkington, Charles Dana Gibson, John Charles Van Dyke, Royal Cortissoz, Henry Hadley, Charles Downer Hazen, George Pierce

Baker, Edwin Anderson Alderman, Edward Channing, Wilbur L. Cross, Herman A. MacNeil, John Russell Pope, Edwin Arlington Robinson, James Earle Fraser, John Huston Finley, William Mitchell Kandall, and Edwin Markham.

The officers in 1929 were: President, Nicholas Murray Butler; secretary, Robert Underwood Johnson, directors, Herbert Adams, Wilbur L. Cross, Hamlin Garland, Robert Grant, Cass Gilbert, Archer Milton Huntington. The offices of chancellor and treasurer were not filled. Headquarters are in the academy building, 633 West 155th Street, New York City.

**ACADEMY OF SCIENCES.** See NATIONAL ACADEMY OF SCIENCES.

**ACCIDENTS.** See RAILWAYS, ACCIDENTS, WORKMEN'S COMPENSATION.

**ADAMSON, WILLIAM CHARLES** American lawyer, public official and legislator, died in New York, Jan. 3, 1929. Born in Bowdon, Ga., Aug. 13, 1854, he was graduated from Bowdon College in 1874, and received the A.M. degree in 1883. Having studied law in a private office, he was admitted to the bar in 1876, and practiced in State and Federal courts, and before the Interstate Commerce Commission, being municipal attorney for Carrollton, Ga., for several years, and judge of the city court, 1885-89. Judge Adamson served as a Democratic presidential elector in 1892, and in 1896 was elected to the Fifty-fifth Congress from the fourth Georgia district, being continuously reelected through the Sixty-fifth Congress. As chairman of the House Committee of Interstate and Foreign Commerce and head of the board, he drafted the much-contested eight-hour railway labor law, also taking a prominent part in other legislation. On being appointed to the board of U. S. General Appraisers, of the Customs Court, by President Wilson in December, 1917, Judge Adamson resigned from Congress. He retired from the board in 1928 to resume private law practice.

**ADAPTATION.** See ZOOLOGY.

**ADELBERT COLLEGE.** See WESTERN RESERVE UNIVERSITY.

**ADELPHI COLLEGE.** A nonsectarian college of arts and sciences for women in Garden City, N. Y., incorporated in 1898. Adelphi was located in Brooklyn, N. Y., until the autumn of 1929, when it was transferred to its new home in Garden City, where it has a campus of about 70 acres and three buildings which can accommodate 1000 students. The enrollment for the summer session of 1929 was 79 students and for the autumn term, 588 students. The faculty numbered 57. Two new departments, physical education and music, were added during the year. The income for 1928-29 was \$230,000. The library contained 26,000 volumes. President, Frank Dickinson Blodgett, LL.D.

**ADEN, a'den or a'den** A volcanic peninsula on the Arabian coast belonging to Great Britain since 1839, about 100 miles east of Bab-el-Mandeb. Area, 75 square miles; including the protectorate, about 9000 square miles. The settlement comprises also the peninsula of Little Aden, some villages on the mainland, and the island of Perim, the last named having an area of 5 square miles. In 1921 the population of Aden and Perim was 54,923, of which 80 per cent was Mohammedan. The population of the protectorate was about 100,000. The manufactures, which are unimportant, consist chiefly of salt and cigarettes.

As the principal commercial centre of the Arabian peninsula, Aden is the entrepôt for the Red

Sea markets of Ethiopia, Eritrea, and Somaliland. It is also important as a fueling station, largely due to its position halfway between the Orient and Europe, and is fortified. The total imports during 1927-28 amounted to 87,538,991 rupees and the total exports for the same period to 80,608,401 rupees. The chief imports were cotton piece goods, grain, hides and skins, tobacco, coal, and provisions; the chief exports were coffee, gums, hides and skins, cotton goods, provisions, sugar, and tobacco. Most of the goods entering the foreign trade are transshipments. In the same year, 1575 merchant vessels of 5,707,205 tons entered the port of Aden, as compared with 1204 ships of 3,058,000 tons in 1912-13.

Attached to Aden are the Kuria Muria Islands off the Arabian coast, five in number, ceded by the Sultan of Muskat. Aden is under a British political resident with four assistants, the British Colonial Office having charge of all political questions and the British War Office, of military questions. The internal administration is in the hands of the Government of India. The gross revenue of the settlement in 1927-28 was 742,625 rupees. In 1929 dredging operations to extend and deepen the harbor were under way, the commerce of the port having shown a steady increase. Political resident and general officer commanding in 1929, Lieut. Col. Sir Stewart Symes.

**"ADMIRAL SCHEER,"** GERMAN CRUISER. See NAVAL PROGRESS, under Germany.

**ADULT EDUCATION, AMERICAN ASSOCIATION FOR** An organization formed in 1926 to serve as a source of information concerning adult education activities and particularly to act as a clearing house through which the experience and findings of every adult educational enterprise may be made available to others. The association also seeks to advise those who are already engaged in adult education, to aid those who are planning to initiate such work, to publish and secure the publication of material useful to those in the field, and to assist in studies of problems fundamental to adult education. Its view is that adult education should count in its enrollment those men and women, young and old, who are no longer in contact with formalized education, whose primary interest lies in a vocation but who possess a secondary interest in their own educational improvement as a sustained and continuing process.

Membership in the association is open to individuals or groups interested in adult education. It depends for financial support upon dues from members, contributions from individuals, and grants from educational foundations. Organizations directly concerned with adult education include libraries, universities and colleges, largely through their extension and other extramural departments, the public-school system; chautauquas, open forums; people's colleges; labor schools, corporation schools; and numerous other agencies, including radio broadcasting, motion pictures, and newspapers.

The association has cooperated with the People's Institute toward the working out of teaching methods and subject matter for adult education in experimental classes in various sections of Greater New York. An investigation of the ability of adults to learn was made by Dr. Edward L. Thorndike and his associates at Teachers College, Columbia University, under the auspices of the association and was published in 1928 under the title, *Adult Learning*. A committee of which

Dean William S. Gray of the college of education, University of Chicago, was chairman, undertook a study seeking to determine the influences which account for the formation of reading habits, desirable or otherwise, the findings were published in 1929 in a volume entitled, *The Reading Interests and Habits of Adults*. The results of a study of the drama and little-theatre movement in relation to adult education were embodied in *Footlights across America*, by Kenneth Macgowan (1929). Other studies undertaken at the instance of the association included prison educational programmes, correspondence-school methods, possibilities of radio broadcasting, and continuing education of collegiate alumni.

The national conference of the association was held in May, 1929, in Chapel Hill, N. C. The officers elected were. President, James E. Russell, dean emeritus, Teachers College, Columbia University; vice president, Prof. Leon J. Richardson, director, extension division, University of California; treasurer, J. H. Puelicher, chairman, committee on education, American Bankers' Association, Milwaukee, secretary, Miss Margaret Burton, executive secretary, education and research division, National Board of the Young Women's Christian Associations, New York City, director, Morse A. Cartwright, New York City. The officers and 14 other members constitute the executive board of the association. Headquarters are at 41 East Forty-second Street, New York City.

**ADVANCEMENT OF SCIENCE, AMERICAN ASSOCIATION FOR THE.** This organization was founded in 1848 to advance science, to give a stronger and more general impulse and more systematic direction to scientific research, and to procure for the labors of scientific men increased facilities and a wider usefulness. In 1929 its membership included about 18,500 individuals interested in the advancement of science and the progress of knowledge and education. There were also 120 autonomous and independent associated scientific societies, of which 89 were officially affiliated with the association, 23 being local academies of science. The association has 15 sections representing the main current subdivisions of science: Mathematics, physics, chemistry, astronomy, geology and geography, zoological sciences, botanical sciences, anthropology, psychology, social and economic sciences, historical and philological sciences, engineering, medical sciences, agriculture, and education. Its activities are of three kinds: Those related to the holding of the annual and other meetings, those related to publications, and those related to the advancement of knowledge by research.

The eighty-sixth annual meeting of the association was held in Des Moines, Iowa, Dec. 27, 1929, to Jan. 2, 1930, with an attendance of about 2000 persons. There also were 33 organizations meeting with the association. At its 175 sessions about 1600 papers and addresses were given by about 1300 persons. The science exhibition also was well developed, with exhibits by commercial firms, individuals, and scientific organizations. Among the important papers read at the general sessions were: "The Discovery of Tertiary Man," by Henry Fairfield Osborn, "An Anthropologist's View of Race," by Fay-Cooper Cole, "Some Aspects of Human Biology," by George H. Parker; "Earthquakes and What They Tell Us," by James B. Macelwane, "The Rela-

tion Between the Size of the Energy Atom and Its Physiological Effect," by W. T. Bovie, "The Application of Mathematics to the Social Sciences," by Irving Fisher, "Glaciation: The Background of the Development of the Mississippi Valley," by George F. Kay, "Some Aspects of Celestial Evolution," by Edwin B. Frost; "Exploration for Human Origins and Migrations in the Far Northwest," by Ales Hrdlicka, "The Alleged Sins of Science," by Robert A. Millikan, and "By Airplane to Pigmy Land," by M. W. Stirling.

The annual association prize of \$1000 for the paper describing a noteworthy contribution to science presented at the annual meeting was awarded to A. J. Dempster of the University of Chicago for his paper entitled, "The Deflection of Hydrogen Positive Rays by Calcite." The next annual meeting was to be held in Cleveland Dec. 29, 1930, to Jan. 3, 1931.

The official organ of the association is a weekly journal, *Science*, which furnishes an open forum for the discussion of questions regarding science and education, almost every branch of scientific knowledge being represented in its columns. In addition, the association issues the *Scientific Monthly*, an illustrated magazine of timely articles of general interest by eminent men of science; prepares an elaborate programme for each annual meeting, and publishes at four-year intervals a volume of *Summarized Proceedings*, including a directory of members. The permanent endowment of the association, the income from which is employed to advance scientific research, amounted on Sept. 30, 1929, to \$159,766; grants are made annually to individuals or scientific organizations to promote research. Two regional divisions are under the auspices of the association. The Pacific division, including the Pacific States, Alaska, the Philippines, and the Hawaiian Islands; and the Southwestern division, including Arizona, New Mexico, Colorado, western Texas, and northern Mexico. These divisions are autonomous, holding annual and other meetings and engaging in special projects in their respective fields.

The direction of the association is entrusted to a council consisting of the officers, secretaries of the sections, representatives of the affiliated societies and academies, and eight members elected at large by the council. It holds an annual meeting at the same time as the association and operates in the interim through an executive committee. The president of the association for 1929 was Robert A. Millikan, eminent physicist and director of the Norman Bridge Physical Laboratory, California Institute of Technology. The president-elect for 1930 was Thomas Hunt Morgan, director of the Kerckhoff Laboratories of the Biological Sciences, California Institute of Technology. The other officers who were to serve until 1932 were: Permanent secretary, Burton E. Livingston, general secretary, Frank R. Lillie, treasurer, John L. Wirt. Headquarters are in the Smithsonian Institution Building, Washington, D. C.

**ADVANCEMENT OF SCIENCE, ASSOCIATIONS FOR THE.** The eighty-sixth annual meeting of the American Association for the Advancement of Science (q.v.) was held in Des Moines, Iowa, Dec. 27, 1929, to Jan. 2, 1930, with 33 affiliated societies. The Southwestern Division of the American Association for the Advancement of Science met in Albuquerque, N. Mex., Apr. 22-25, 1929.

The Pacific Division met in Berkeley, Calif., June 19-22, 1929. The British Association for the Advancement of Science (q.v.) met in Cape Town, South Africa, July 22-31, 1929. The French Association for the Advancement of Science met in Havre July 25-30, 1929.

**ADVENT CHRISTIANS.** See **ADVENTISTS**. **ADVENTISTS.** The Advent Movement had its origin in America with William Miller, who believed not only in the coming of Christ in person, power, and glory, but that such an advent was at hand and that the date might be fixed with some definiteness. The movement, however, began in England and on the Continent, under the leadership of the Rev. Hugh McNeile and the Rev. Edward Irving, in England, and the Rev. Joseph Wolfe, DD, LL.D., in Prussia. A Prophetic Conference was held at Albury Park in 1836, at the residence of Henry Drummond, Esq., afterward a member of the British Parliament, with "Eight days of serious study of the prophecies," at which the Rev. Hugh McNeile presided. The first general gathering in America of those interested took place in Boston, October, 1840, the movement at that time being wholly within the existing churches, but in April, 1845, a conference was held at Albany, N. Y., at which the adherents of the Adventist doctrine were organized and a declaration of principles adopted, embodying the views of Mr. Miller. For the next ten years this organization included practically all the Adventists, but gradually separate bodies developed, beginning with the Advent Christian Church, in 1855, and including the Seventh-Day Adventists, organized in 1860; Life and Advent Union, in 1864; The Church of God (Adventists), in 1866; and The Churches of God and Christ Jesus, in 1888.

**ADVENT CHRISTIAN CHURCH.** This church which is congregational in church government holds simply to the general imminence of Christ's return but takes the position that the day cannot be determined. It holds a biennial general conference, the 1928 meeting having been held in Dowling Park, Fla. Statistics for 1929, covering 44 conferences, showed 527 churches, 494 ordained ministers, 109 licensed ministers, 29,381 church members, 333 Sunday schools, 20,139 Sunday-school members, 131 Young People's Societies of Loyal Workers, with 2831 members. The denomination maintains four publication societies and two educational institutions, Aurora College in Aurora, Ill., and the New England School of Theology in Boston. Periodicals published include *The World's Crisis* (Boston), *Messiah's Advocate* (Oakland, Calif.), *Our Hope* (Mendota, Ill.), and *Present Truth Messenger* (Lave Oak, Fla.). Among the philanthropic institutions of the denomination are the American Advent Christian Home and Orphanage in Dowling Park, Fla., and the Vernon Home for ministers and missionaries in South Vernon, Mass. The Rev. J. William Denton was general director of the Advent Christian General Conference in 1929. Headquarters are at 160 Warren Street, Boston.

**SEVENTH-DAY ADVENTISTS.** This denomination, which is the largest of the Adventist group, embraces 12 union conferences in the United States and Canada. It believes that the seventh day of the week, from sunset on Friday to sunset on Saturday, is the Sabbath established by God's law and that immersion is the only proper form of baptism. The local church is congregational

in government, although under the general supervision of the conference. The statistical report of the denomination for 1928 indicated 2229 churches in the North American division, 869 ordained ministers, and 113,737 church members; Sabbath schools numbered 2724 and the membership, 119,491. The foreign division consisted of 3998 churches, 1012 ordained ministers, 171,556 church members, and 6297 Sabbath schools, with an enrollment of 222,943. The movement maintains in the United States and Canada 96 educational institutions, which in 1928 had an enrollment of 16,188 students. Of the colleges and seminaries, Loma Linda Medical College, Loma Linda, Calif., and Pacific Union College, St. Helena, Calif., are the largest. There are also 79 educational institutions maintained in foreign countries. The denomination has 18 publishing houses in North America and 38 in foreign countries. During 1928 denominational literature was issued in 141 languages and evangelistic work was conducted in 135 countries. Periodicals of the movement include *The Advent Review and Sabbath Herald* (Washington), *Signs of the Times* (Mountain View, Calif.), and *The Watchman* (Nashville, Tenn.). The headquarters of the General Conference of Seventh-Day Adventists are at Takoma Park, Washington, D. C.

**AERONAUTICS.** The development of commercial air transportation and its systematic extension undoubtedly was the leading feature of progress in aeronautics during the year 1929. There was unquestionably active development also along technical lines, including the improvement of planes and engines and the construction of larger and more improved airships, for long-distance transportation. The globe was circumnavigated for the first time by a dirigible and a number of important flights as usual were to be recorded, but, all things considered, the rapid increase in organizing air-transportation facilities and the systematic operation of airways on a regular schedule were the main features of the year and consequently find somewhat extended treatment in this summary. As usual, the **YEAR BOOK**, in the following paragraphs, records the more significant developments of the year, observing the customary grouping.

**NATIONAL BALLOON RACE.** The National Elimination Balloon Race for the Litchfield Trophy, which was held from the Pitt Stadium, Pittsburgh, Pa., on May 4, was won by Lieut. Thomas W. G. Settle, U. S. N., and his aide, Ensign Wilfred Bushnell, U. S. N., in the N. S. Navy A-8278 No. 1 balloon, which covered a distance of 952 miles in an elapsed time of 43 hours and 20 minutes, landing at Savage Island, Prince Edward Island, Canada. The contest established a new international record for free balloons for both distance and duration for balloons of 1201-1600 cubic meters capacity. Second place was won by W. T. Van Orman and A. L. MacCracken, in the balloon *Goodyear VII*, landing at Plattsburgh, N. Y., a distance of 403.6 miles. Third place was taken by E. J. Hill and A. G. Schlosser, holders of American duration records, in the Detroit *Times* entry, which landed near Tahawus, N. Y., after covering a distance of 386.4 miles. These contestants later constituted the United States team in the international Gordon Bennett Balloon Race. The contest attracted 12 entries.

**GORDON BENNETT BALLOON RACE.** The Gordon Bennett Balloon Race of 1929 was held from St.

Louis, September 28, and resulted again in a victory for the United States, being won by Ward T. Van Orman in the balloon *Goodyear VIII*, with 341 miles to his credit. Second place was won by Capt. W. E. Kepner, U. S. A., in the Army balloon with 338 miles, and third place, by Lieut. T. G. W. Settle, U. S. N., in the Navy balloon, with 304 miles. According to the official results, the balloons, pilots, aides, landing places, and distances in miles were as follows:

First, *Goodyear VIII*, United States, Ward T. Van Orman, Alan MacCracken, 3 miles southeast Troy, Ohio, 341 miles.

Second, Army, United States, Capt. W. E. Kepner, Capt. J. F. Powell, 3 miles north Neptune, Ohio, 338 miles.

Third, Navy, United States, Lieut. T. G. W. Settle, Ensign W. Bushnell, 10 miles southwest Eaton, Ohio, 304 miles.

Fourth, *Belges*, Belgium, Ernest Demuyter, Frans Lecharlier, Corydon, Ind., 226 miles.

Fifth, *Denmark*, Denmark, Georg Schenstrom, S. A. U. Rasmussen, 5 miles southeast Bedford, Ind., 209 miles.

Sixth, *Lafayette*, France, Georges Blanchet, H. A. Scholle, Stineville, Ind., 200 miles.

Seventh, *Barmen*, Germany, Hugo Kaule, Jr., Fritz Ebener, 4 miles southeast Melvin, Ill., 171 miles.

Eighth, *Essen Stadt*, Germany, Eric Leimkugel, George Froebel, Cadlin, Ill., 169 miles.

Ninth, *Argentina*, Argentina, D. Eduardo Bradley, Francisco J. Cadaval, Fairbanks, Ind., 155 miles.

**BRITISH AIRSHIPS** The completion of the large airships, the *R-101* and the *R-100*, described in earlier YEAR BOOKS, was an important event of the year. The *R-101* built by the British Government for service on the England-India air route, after designs by government engineers, completed her shed trials on October 1 and on October 12 was successfully launched and taken to the mooring tower at Cardington. She made several flights during the autumn in one of which she was in the air for 30 hours and later was returned to the air shed for minor alterations and adjustments. The test flights, although not officially described by the end of the year, seemed to indicate that the new ship had functioned satisfactorily, but complete details were issued of the performance of the heavy-oil engines which were used in the power plant for the first time. The *R-101* is 724 feet in length or 50 feet shorter than the *Graf Zeppelin*, and 130 feet in diameter, or 30 feet larger in waist measurement than the German airship. The lifting gas displacement was 5,000,000 cubic feet, as compared with 3,710,000 cubic feet of the *Graf Zeppelin*. The *Los Angeles*, of the U. S. Navy, for purposes of comparison may be said to have 2,470,000 cubic feet gas capacity, or over a million cubic feet less than the *Graf Zeppelin*.

The *R-101* has its principal framing made of stainless steel tubing with aluminum alloy used for the minor structural members. In this respect, it differed from the *R-100*, which, like other modern airships, utilizes for its framing the aluminum alloy, duralumin. The ship has two deck passenger cabins with dining, sleeping, and recreational accommodations for 100, contained within the hull in order to reduce the air resistance that would be caused by a car slung below the large cigar-shaped structure, and in this respect it anticipates the design of the new United States Navy airships discussed elsewhere. Hydrogen is used as the lifting gas, so that it is necessary to restrict smoking to a single smoking-room which has been specially designed. The dining-room of the *R-101* seats 60 guests and there is also a lounge or main cabin with a bal-

cony at each end with non-splintering glass observation areas.

From a technical point of view, the important consideration is the use of heavy-oil engines to propel the great airship, eliminating the highly inflammable gasoline which naturally is a hazard in proximity to the hydrogen lifting gas. There are five Beardmore Torridio engines which develop 650 B.H.P. at 1000 revolutions per minute. These are Diesel engines of the compression-ignition type using a fuel oil of high flash point. Being self-igniting, spark plugs are not required and carburetors also are lacking. Waste heat from the two side engines is utilized in heating the quarters of the crew and passengers. One of the engines has to be reserved for propelling the vessel astern, being connected to the screw with a reversed pitch. It was found that the engines had to run at 900 revolutions per minute instead of the designed speed of 1000 revolutions per minute, so that the power available for driving the ship ahead was reduced from the total of 3250 B.H.P. to a total of 2340 B.H.P.

While the *R-101* was government-built her sister ship, the *R-100*, was constructed by the Airship Guarantee Company, a private firm, at Howden, Yorkshire. This craft, 709 feet in length and with a maximum diameter of 133 feet, was taken over for flight trials by the Air Ministry on November 22 and, after a delay caused by unfavorable weather, was launched from her shed on December 10, making 140 miles in two hours. There was a second flight on December 18 after which the ship was returned to her shed at Cardington for minor adjustments to the fabric covering. Consequently, little technical data was available regarding the flights at the end of the year. The engines of the *R-100*, as stated, used gasoline.

Further developments in the heavy-oil engines by the builders of those used in the *R-101* were under way and late in the year it was announced that a new engine with the same sized cylinder as used in the *Torridio*, 8½-inch bore by 12-inch stroke, had been designed, but with six cylinders in line instead of eight, so that it could run at a higher speed.

**UNITED STATES AIRSHIPS** On November 7 at Akron, Ohio, a gold rivet was driven in the uppermost portion of the first great ring of the duralumin skeleton of the U. S. Navy airship, *ZRS-4*, which with her sister ship *ZRS-3*, was the largest airship in the world so far to be designed. The construction of this airship was being undertaken in a special hangar, which the Goodyear-Zeppelin Corporation had built to take the *ZRS-4* and the *ZRS-5*. The shed had a length of 1175 feet, a width of 325 feet, and a height of 197 feet. It was of special design with doors at each end with two leaves which together constituted a quarter of a hemisphere. These leaves open and close by means of electric motors. The shed has a total area of 364,000 square feet. The new airships were designed with a length of 785 feet with a maximum diameter of 134 feet, 9 inches, and a height of 146 feet, 5 inches. Each airship will require 6,500,000 cubic feet of helium gas and will have a gross lift of 180 tons, as compared with 152 tons for 5,000,000 cubic feet of hydrogen carried in the British *R-101*. There are eight engines developing a total of 4480 horse power, installed within the hull instead of in suspended gondolas. The method of construction involved in building the airship frame was to construct a series of large rings giving the ship its cylindrical form, these

rings being constructed flat on the floor of hangar. A novel feature of the design was to provide in the airship a hangar compartment capable of accommodating five scout planes which could be released and taken aboard as required.

**METAL CLAD AIRSHIP.** A notable development of the year was the ZMC-2 airship, built by the Aircraft Development Corporation of Detroit, which, inflated with helium, made its first flight on August 19, and which later was turned over to the U S Navy for further experiment and trial. This novel airship was 149 feet in length, and 53 feet in diameter, capable of lifting a useful load of 3127 pounds and flying 680 miles at a cruising speed of 50 miles per hour. On the frame, consisting of five main, and seven subsidiary, rings stayed by radial wire and united to one another by 24 longitudinal girders, was fitted a skin aluminum sheeting less than 100th of an inch in thickness and composed of a series of sections riveted one to another with joints rendered gas tight by a bitumen compound. The skin serves as the actual gas container and acts structurally as a part of the hull. A car, with accommodations for a crew of three and four passengers, is carried beneath the hull and is equipped with a Wright Whirlwind engine of 220 horse power. Control is effected by eight radial fins placed 30 feet forward from the stern, the two upper and two lower fins being provided with co-acting rudders and the two port and the two starboard fins, with co-acting elevators.

**"GRAF ZEPPELIN'S" FLIGHT AROUND THE WORLD.** During the year, the airship, *Graf Zeppelin*, described in the 1928 and earlier *YEAR BOOKS*, made a notable trip around the world, circumnavigating the earth by airship for the first time. In the course of still another flight to the westward in May, motor trouble developed, the airship returned, and landing near Toulon, France, made repairs before returning to Friedrichshafen. A successful trip was made to the United States in July, completed on August 4. Then proceeding on its world circling trip, it flew over 12 different countries and 13 States of the United States, requiring 21 days, 7 hours, and 34 minutes and, throughout the world flight, the average speed maintained was in excess of 50 miles an hour, the rate rarely, if ever, exceeding 70 miles. The *Graf Zeppelin*, under command of Capt Hugo Eckener, left Friedrichshafen on August 16, and its course was over Germany, Latvia, Estonia, and into Russia. From Russia, Siberia was traversed, and at Kasumi-gaura, Japan, a distance of 9980 miles had been covered in 101 hours and 44 minutes. The Zeppelin came to earth and was duly placed in a hanger through the assistance of the Japanese Navy. After a rest and notable reception in Tokyo, the Zeppelin proceeded August 23 on its way across the Pacific and in 68 hours and 51 minutes made the 5400 miles from Kasumi-gaura to the Golden Gate. The city of San Francisco was duly circled, and the *Graf Zeppelin* then proceeded to Los Angeles, where on August 26 it was tied to the mooring mast at Mines Field. The next section of the flight was across the United States, with unfavorable air conditions over Arizona, and after a rest at Lakehurst, the final flight to Friedrichshafen, reached on September 4, was accomplished in 67 hours. On the August 4 transatlantic trip, 46 hours and 52 minutes were required for the flight from New York to Paris and favorably compared with Lindbergh's record of 33½ hours and Byrd's

flight of 43 hours and 21 minutes from New York to the French coast. The globe-encircling flight was made under service conditions with passengers and cargo and was a further step in advancing commercial aviation. A trip to the North Polar region arranged during the year was canceled on December 23, various reasons for its abandonment developing.

**GIANT AIRPLANES.** It may be said with truth that the year witnessed the development of giant airplanes for passenger service, and first among these in point of size was the Dornier DO X flying boat, developed in Germany by the engineer after whom the plane was named. The Dornier airplane, designed to carry 100 passengers besides its crew, had a wing-spread of 150 feet, with a chord of wing of 32.8 feet, and an approximate major-wing area of 8150 square feet. The craft, built entirely of metal, was 149 feet long overall, and its gross weight loaded was 106,000 pounds, or 53 tons, and its weight empty 55,000 pounds. The power plant consisted of 12 Bristol-Jupiter engines, each of 525 horse power, or a total of 6300 horse power. The engines, controlled from a central station, were placed in tandem sets of two, rigidly mounted on top of the wings standing some 21 feet above the water line. On October 21, this huge flying boat, carrying 159 passengers, in addition to a crew of 10 (the largest number of persons ever carried by aircraft), and fuel for 750 miles, weighing with load 50 tons, was in the air one hour over the surface of Lake Constance, flying about 110 miles over the lake and neighboring country. It maintained an average altitude of 600 feet, which at times was increased to 1200 feet. It took off and landed with ease and was readily handled in the air. The promoters expressed satisfaction with the performance of the new ship.

Another notable large-sized plane, also of German design and construction, was the Junkers G-38, a 32-passenger plane which was provided with sleeping compartments for direct transcontinental service. Built entirely of metal, it had four Junkers engines, two of 800 horse power, each driving four-bladed tractor propellers, and two of 400 horse power, each driving two-bladed screws, the power plant developing a total of 2400 horse power. These four engines were built integral into the front edge of the wings. Later Junkers heavy-oil Diesel engines, under test in another plane during the year, were to be installed. The machine, the largest landplane so far to be built, weighed 13 tons empty and 20 tons when loaded. The use of a wing section of great thickness made possible accommodation of passengers inside the wings with windows on the forward edges on both sides of the fuselage nose.

In Italy, Caproni, the famous designer, during the year prepared designs for two notable planes, one a 6000-h p. biplane and the other a 3000-h p. monoplane, the latter with pontoons capable of carrying three and one-half tons of useful load and making the trip from Rome to New York via the Azores and Bermuda with two stops.

In the United States, the Fokker Aircraft Corporation of America had under construction the Model F-32 type, a 32-place passenger transport plane motored with four Pratt & Whitney Hornet engines and weighing over 11 tons fully loaded. This was the largest land plane in the United States up to the end of 1929. Another American plane of the year was the *Commodore*, a 32-place flying boat weighing nearly nine tons

## NOTABLE AIRPLANES OF 1929

loaded and built by the Consolidated Aircraft Corporation. This was the largest of its type in the United States.

There was a notable increase in the passenger-carrying capacity of the airplanes employed for air transport in the United States. At the beginning of the year, planes with a capacity of 10 passengers ruled, but at the end, the number had increased to 15, 18, and 20 and the Fokker F-32, a 32-passenger plane, as stated, was under construction for use early in 1930. The tendency during the year 1929 was to use multi-engined planes and this seemed to be increasing. In an analysis made of leading air lines, it was found that on 16 lines three-engined planes were employed, on four lines twin-engined planes, and on 16 lines single-engined planes. In one notable instance, namely the Transcontinental Air Transport Line, where Col. Charles A. Lindbergh was chairman of the technical committee with C. S. ("Casey") Jones and Maj. Thomas Lamphier, formerly of the United States Air Corps, as associates, tri-motored planes were recommended for the extensive service of this operating company. It was realized, of course, that tri-motored planes could fly on two of their three engines and could have a wider landing radius with but one engine running. The tri-motored plane also was used by the Universal Aviation Corporation when it established its coast-to-coast service.

**OPEL ROCKET PLANE** Considerable interest was aroused during the year by the report of a successful flight of Fritz von Opel in a rocket plane on September 30, at Frankfort, Germany. This accomplishment involved making a take-off, assisted flight, and landing with the aid of rockets only, with the plane under control during the procedure. There had been previous experiments in rocket propulsion made earlier in the year by the German pilot, Stahmer, in connection with the flight of a regular airplane. The apparatus of von Opel was a simple glider provided with a single cantilever wing of wood construction partially planked with wood and the remainder covered with fabric. A fuselage of wood accommodated the pilot, who was provided with a conventional type of control-stick, while in the rear was the box containing the rockets which were carried in tubes, the whole reinforced by struts and supports attached to the keel. There was a tail with horizontal surface to which the elevator was attached and two fins on which the rudders were fixed. The tail surfaces were arranged so as not to be in the path of the rocket explosions. There were 16 rockets carried in rows of four in the box which fitted into the abbreviated fuselage, and the detonation could be controlled by a mechanism available to the pilot. Eleven of the rockets were of the continuous-burning type, producing a uniform thrust of about 50 pounds for a period of 25 seconds. The remaining five were of a quick-burning type used in landing. The plane rested on a small car, also rocket-propelled, which ran on a track affording a run-way of about 50 feet of useful length. Three rockets were used with this car affording a thrust of about 600 pounds. Two trials of Herr von Opel were unsuccessful, but a third was considered entirely successful on an experimental basis. The average velocity during a flight of  $1\frac{1}{4}$  miles in 75 seconds was about 95 miles per hour, and the thrust of the rockets varied between 145 and 200 pounds. The apparatus was somewhat damaged in the course of the experiments due to an unfortunate landing but

sufficient was accomplished to warrant further work in the light of the experience gained.

**AUTOGIRO PROGRESS** Progress continued during the year in the development of the autogiro, invented by Juan Cierva, and three American-built machines with Wright J-6 geared engines were flown in numerous flights. On October 22, a notable test was made at Pitscarrn Field, Bryn Athyn, near Philadelphia. The engineer was able to make practically vertical landings after some half-dozen flights and to make a speed of about 100 miles per hour. In this autogiro, there is a fuselage 15 feet long and an air-cooled Genet Major engine of 100 horse power. Two small wings have bent up tips to increase the lateral stability of the craft while in the air, and the "windmill" has four blades which are set in motion by air thrown up to the horizontal propeller by a deflector, maintained about the horizontal stabilizer, placed at the end of the fuselage. The power thus developed gives a rotation of 130 revolutions per minute to the vanes, a speed which must be maintained before the plane takes off.

**AIRPLANE ENGINES** The Packard Diesel engine, as developed for airplanes and discussed in the 1928 YEAR BOOK, underwent a severe service test in a successful flight on May 13, 1929, from Detroit to Langley Field, Va., a distance of 700 miles. The engine was installed in a Stinson monoplane and the flight took 6 hours and 40 minutes. The coarse fuel oil, ordinary furnace oil, burned in this flight cost but \$4.68, as compared with an estimated cost for a gasoline engine of equivalent capacity of approximately \$24. The new motor was a radial internal-combustion engine rated at 200 horse power, and resembling in external appearance the radial type of gasoline engine but simpler and smaller. It weighed less than 3 pounds per horse power, as against 100 pounds per horse power in the case of an ordinary stationary Diesel engine. There were no electrical ignition systems and the oil fuel was injected into each cylinder separately. Such a motor naturally reduced the fire hazard of the plane. The builders were continuing experimental and development work and had built a special plant to undertake quantity production of the new engine in several sizes during the following year.

In the early autumn, tests were made in France, both on the bench and in trial flights, of a new Diesel power unit for airplane use designed by M. Clerget, who had been a pioneer in airplane-engine designing. This engine was of a nine-cylinder, radial, air-cooled type, using heavy oil and developing 80 to 100 horse power. It was a four-stroke engine following the constant-volume cycle with a sufficient compression to provide self-ignition. Each cylinder had an independent fuel pump and atomizer and was able to start by means of a mechanical starter. The weight of the first experimental engine was a little more than 45 pounds per horse power, a result never achieved for a heavy-oil engine of less than 100 horse power. For test purposes, it was installed on a Morane-Saulnier A. R. monoplane, which ordinarily was equipped with a 120-h. p. gasoline engine. The first test was encouraging and subsequent endurance tests were planned.

An interesting test of the endurance of an airplane motor was made in England with a De Haviland Gypsy engine which was sealed on Dec. 28, 1928, and, after an endurance test of 600 hours in the air without major overhauling and a fly-

ing service of about 51,000 miles, was taken down and examined. In this period, one magneto was changed, but aside from that the amount of wear and tear was found to be within the requirements of a British certificate of air worthiness. The entire repairs could have been made at an expense of a little more than \$35. It was stated that, at the conclusion of the test, the engine had developed greater horse power than at the beginning.

**FLYING BY INSTRUMENTS** During the year, a notable series of experiments in flying by instruments alone were made by Lieut. James H. Doolittle, U. S. A., in connection with the Guggenheim Fund for the Promotion of Aeronautics. These experiments, conducted at Mitchell Field, N. Y., were aimed particularly to secure safety and proficiency in fog flying, and Lieutenant Doolittle was able to take off, fly, and land "blind" several times under such severe conditions of test as to demonstrate that with instruments developed and readily available it was possible to fly indefinitely without being able to see outside the cockpit. In these tests, which reached a successful climax on September 24, Doolittle was seated in an enclosed blind cockpit and was able to take off, hold his plane to a course, and make a landing entirely by the use of instruments and without seeing the ground. While it was shown conclusively that it was possible to fly and land by instruments alone, the procedure at the end of the year was still in an experimental stage and needed to be brought to a point where it was commercially applicable, so that it could be used generally and particularly for flying in a fog. In this event, Lieutenant Doolittle stated that the airplane would become the safest known means of transportation, as it would be the only one that could operate unhampered by fog.

The test made for blind flying by Lieutenant Doolittle was as follows. After his instruments had been correctly calibrated and set at zero, the takeoff was made in the path of a radio beam which was followed about 4 miles, while the plane climbed 1000 feet, being piloted in the meantime by means of gyroscopic instruments. The plane then was turned around and headed back into the beam. As the radiobeacon, which was the source of the beam, was approached, the beam became narrower, and, while it was more difficult to follow, the course became more exact and, at the exact moment of passing over the beacon house, an indicating reed stopped vibrating momentarily and then began to vibrate in the opposite direction. Lieutenant Doolittle followed the beam about four miles again in the new direction, made a turn, and approached the field at an altitude of about 400 feet. Preparing to land, he followed the exact centre of the beam with the aid of the directional gyroscope and with his progress accurately indicated on the instrument both as regards speed and descent was able to make a safe landing at such an angle that the plane absorbed the shock of hitting the ground. He was able to read his altitude within 10 feet of the exact figure from an instrument for which varying air pressure was checked by radio from the ground. The actual landing was made at a speed of about 55 miles an hour and a glide of 400 feet per minute.

**AUTOMATIC PILOT DEVICE** A gyroscopic stabilizer, or automatic pilot device, produced by the Sperry Company, was tested during the autumn on a tri-engine Ford plane in a flight from Wright

Field, Dayton, Ohio, to Bolling Field, Washington. In this automatic mechanical robot, the equipment consisted of two gyroscopes, the armatures of which were electrically driven at 15,000 revolutions per minute by means of an externally-mounted, wind-driven, electric generator. One of these gyroscopes was mounted horizontally and the other vertically and, through electrical contacts, kept the plane in an even position. In this flight, the pilot of the craft set the stabilizer after taking off, and did not resume control until about 30 miles from Washington. The gyroscopes maintained certain definite positions regardless of the motion of the airplane, and any departure from the position set developed a pull restoring the craft to an even keel. It was said that the new automatic pilot was sensitive to change of movement of one-half of one degree about the airplane's axis. The apparatus weighs about 50 pounds and occupies a space of only 14 x 14 x 10 inches beneath the pilot's seat. It affects the three major controls of an airplane—the rudder for direction, the elevator for upward and downward movements, and the aileron for maintaining lateral balance.

During the year, the U. S. Bureau of Standards and others developed plane-to-ground, two-way radio communication, which was believed to be an important means toward greater safety in flying. Another important development was a radio-echo altimeter which was devised and tested. The Bureau of Standards also discovered that a coating of pure aluminum on the lighter duralumin, so extensively used in aircraft, protected the metal from corrosion and made it much more useful in aircraft. The application of ethylene glycol for the cooling of airplane engines made possible the improvement of the liquid-cooled engines.

During 1929, pilot charts of the upper air over the North Pacific Ocean were published monthly for the use of aviators by the United States Hydrographic Office.

**NOTABLE FLIGHTS** The airplane for several years had been accepted as a necessary feature of polar exploration. Commander Richard E. Byrd (promoted Rear Admiral U. S. Navy, December 21), with an airplane party, on Nov. 29, 1929, flew from his base to the South Pole and back. A series of exploratory flights had been made in that region, resulting in notable discoveries. It will be recalled that Commander Byrd in 1926 had flown over the North Pole. The Antarctic expedition of Capt. Sir Hubert Wilkins also utilized the airplane in exploration of the Graham Land sector on the other side of the Antarctic continent in a notable flight on December 31 over Charcot Island and to the south, adding some 300 miles of new coast line to the Antarctic continent. Airplanes also figured in the explorations of Sir Douglas Mawson and of the *Norvegia*, Bouvet Island being surveyed from the air by Captain Ruess-Larsen. See **POLAR RESEARCH**.

In 1929 there were three non-stop flights across the Atlantic Ocean, of which the most noteworthy was that of Captains Ignacio Jimenez and Francisco Iglesias flying from Seville, Spain, March 24, to Bahia, Brazil, a distance of 4200 miles, in the plane *Jesus del Gran Poder*. The original destination was Rio de Janeiro, but the plane was forced down by lack of fuel after 43 hours and 48 minutes. Jean Assolant, René Lefevre, and Armento Lotte, Jr., flew from Old Orchard, Me., to Comillas, Spain, in the French

monoplane, *Yellow Bird*, 3128 miles in 29 hours and 52 minutes on June 14 Roger Q Williams and Lewis A. Yancey, in the *Pathfinder*, flew on July 8 from Maine to Spain and continued to Rome, Italy, arriving on July 10.

A notable flight of the year was that from New York to Los Angeles and back in 36 hours, 49 minutes, and 48 seconds of actual flying time made by Captain Frank Hawks, landing at Roosevelt Field June 29 His westward time was 19 hours, 10 minutes, eastward, 17 hours, 44 minutes Captain Hawks earlier in the year on February 5 had made a West-East transcontinental record of 18 hours, 22 minutes.

Refueling in the air eleven times, a two-way, non-stop flight, was made by Mamer and Walker in the *Spokane Sun God* from Spokane, August 15, to New York and return, 115 hours 45 minutes in the air, and a round-trip distance of 7200 miles.

*The Land of the Soviets*, an all-metal, two-engine, monoplane designed and built at the Central Aero-Hydro-Dynamic Institute (Tsagi) of the Soviet Union, made a flight from Moscow to New York, a distance of 12,883 miles in 141 hours and 33 minutes flying time, on an actual time of 72 days from August 23 to November 1. The flight was across Russia, Siberia, Alaska, and the United States at an average speed of 91.3 miles The crew consisted of S. A. Shestakov, chief pilot, F. E. Bolotov, naval pilot, V. V. Sterligov, aero-navigator, and D. V. Fufaev, mechanic.

A notable international non-stop flight was that of George W. Haldeman who, on February 23 flew from Canada to Cuba, 1404 miles in 12 hours and 56 minutes, the first time this trip ever had been made.

The Curtiss Marine Trophy Race, held at Anacostia, D. C., May 25, produced a new speed record for standard military seaplanes of 162.52 miles per hour and was won by Lieut. W. G. Tomlinson, U. S. N.

REFUELING FLIGHTS Record refueling flights were made and supplanted several times in the United States during the year. On January 7, the *Question Mark*, with a crew of five under the command of Maj. Carl Spatz, rising over southern California maintained a record flight of 150 hours, 40 minutes, and 15 seconds, a time in excess of the duration record for lighter-than-air craft. The *Fort Worth*, with Reginald Robbins and James Kelley as pilots, then gained the record on May 26, when this plane was in the air for 172 hours, 32 minutes, and 1 second, over Fort Worth, Tex. On July 6, a Stinson-Detroit plane equipped with a Wright Whirlwind engine, piloted by Byron K. Newcomb and Roy L. Mitchell, returned to earth after remaining in the air 7½ days and making an endurance flight record of 174 hours and 59 seconds. During this flight, 24 refueling contacts were made, and for the first time an automatic forced-oiling system was employed. This record stood only until July 9, when a Buhl cabin sesquiplane, piloted by L. W. Mendell and R. S. Reinhardt, was in the air for 240 hours and 44 minutes. Finally, the *St. Louis Robin*, taking off from Lambert-St. Louis Flying Field on July 13 and piloted by Dale Jackson and Forest O'Brien, made a record for sustained flight of 420 hours, 21 minutes, and 30 seconds, using 3590 gallons of gasoline and 158 gallons of oil, 77 contacts being required with the refueling plane of which 48 were used for the

transfer of gasoline. This airplane was capable of a still longer period aloft when those responsible for the flight ordered the craft to the ground, as the possibility of extended flight had been duly demonstrated.

On Dec. 17, 1929, the long distance-record was broken by Capt. Dieudonne Costes and Paul Godos who, flying over a measured triangular course at Istres, France, covered 4990.33 miles in 52½ hours. This supplanted the distance record made by Clarence Chamberlin on his flight to Germany in 1927 and was to be compared with the performance of Orville Wright exactly 26 years earlier when he flew 120 feet in the first man-carrying, power-driven airplane.

SCHNEIDER RACE The Schneider International Cup Race for Seaplanes, the first to be held since 1927, was contested at Cowes, England, over the Solent on September 7 and was won by Flying-Officer Henry R. D. Waghorn of the Royal Air Service, who flew in seven laps over the course of 217.8 miles at an average speed of 328.64 miles per hour. His plane was the Supermarine, S-6, with a Rolls-Royce engine, the engine being developed from the Supermarine Napier, which won at the Lido in 1927 and which scored third place in the 1929 competition. The speed of the 1929 winner was 47 miles per hour faster than that achieved in 1927 and that, in turn, was 34.99 miles per hour better than the record of the Italian, Major Bernhardt, who won in 1926 at Hampton Roads, Va. Second place in the 1929 competition went to Variant Master Tomaso Dal Molin, who flew a Machi Fiat, M-52, over the course at an average speed of 284.20 miles per hour, and third place to Flight-Lieut. D'Arcy Greig, with 282.11 miles per hour in the *Napier*. There were in all six seaplanes in the competition, and these on the previous day had passed a test for navigability and seaworthiness. The competition was confined to Italy and Great Britain, as the failure in the flight tests of Lieut. A. J. Williams, U. S. N. *Mercury* racer, mishaps to the French team, and the lack of time afforded to prepare for entry reduced the number of competitors. The best lap-time during the race was made by Flying-Officer R. L. R. Atcherley, who negotiated two laps of 100 kilometers at 332.9 miles per hour. Subsequently, on September 12, the Supermarine machine, piloted by Squadron Leader Augustus H. Orlebar, established a world's speed record of 357.7 miles per hour. Later in the year, the British Air Ministry announced that it would not take part in the 1931 Schneider Trophy Contest or in any subsequent competition, but it was thought that the Italian government would continue the interest that it had previously manifested in this work.

NATIONAL AIR TOUR The fifth national air tour of 1929 started with 29 air crafts of different types, which embarked on a 5017-mile flight on October 5, and was completed by 24 of the planes. The tour covered 20 States and two Canadian provinces, extending as far south as Jacksonville, Fla., and west to Wichita, Kansas. Five of the entries withdrew either on account of motor trouble or plane damage. The first prize, a cash award of \$2500, and the Edsel Ford Trophy were won by John Livingston in a Waco straight-wing bi-plane powered by a 225-h.p. Wright engine. The competition was based on a series of points of merit, and Livingston's total score was 45,672.63, as compared with 28,090.60 for the tenth place which carried with it a prize of \$300. The

1929 tour was somewhat shorter than that of the previous year, but, as usual, it covered a number of important cities and aroused considerable interest among others than the contestants. Three women started on the tour and two finished.

**NATIONAL AIR RACES.** This important American competition was held Aug 24 to Sept 2, 1929, at Cleveland, Ohio, and in attendance, performance, and general interest was more important than any previous event of the kind. Civilian aircraft shared with Army, Navy, and Marine Corps flyers the honors in acrobatic and other maneuvers. Col. Charles A. Lindbergh made his first appearance with a naval team, flying each day with Lieuts. F. O. Kivette and Frank O'Beirne of the Navy's Flying Squadron No. 1, performing such feats as wing-tip formations, squirrel-cage loops, and inverted flying. There were also civilian stunt teams representing the Waco, Laird, and Travel Air companies. The programme covered every phase of aeronautical activity, planes of every type being used.

Of the nine long-distance competitions, which terminated at Cleveland, the women's cross-country derby from Santa Monica to Cleveland was of greatest interest, first place and a prize of \$3600 being won by Mrs. Louise McPhetridge Thaden in a flying time of 20 hours, 2 minutes, and 2 seconds, at a speed of 135.97 miles per hour; Miss Gladys O'Donnell finished second, with a record of 21 hours, 21 minutes, and 43 seconds, 127.52 miles speed. The All-Ohio derby, with a first prize of \$1000, was won by Lewis Love in a Davis monoplane Vs with a LeBlond five-cylinder engine in an elapsed time of 4 hours, 43 minutes, and 15.6 seconds, and the Portland (Ore.)-to-Cleveland derby, first prize \$3000, by T. A. Wells in a Travel Air D-4000 plane with a record of 14 hours, 44 minutes, and 10 seconds. The Miami-to-Cleveland race was divided into three classes, Class C being limited to planes with engines of 275 to 510 cubic inches displacement, and Class D for engines with a displacement ranging between 510 and 720 cubic inches. The winner in Class C was George E. Halsey, who flew in a Challenger powered Rearwin Ken Royce biplane over the course in 12 hours, 42 minutes, and 4.5 seconds. The winner in Class D was Earl Rowland, whose Cessna cabin plane made the journey in 12 hours, 30 minutes, and 41 seconds. The Philadelphia-to-Cleveland derby for planes of the cabin type was won by Errett Williams in an Alexander Bullet, and the Oakland-to-Cleveland derby, with first prize of \$300 for cockpit or mail-type planes, by Loren W. Mendell, who flew from California in a Buhl Cabin Monoplane, powered by a 300-h.p. Wright J-6 engine in 17 hours, 43 minutes, 16 seconds.

Two Toronto-to-Cleveland races were held—the Canadian commercial derby and the Canadian Club derby. The first was won by Herbert St. Martin in a Travel Air Wasp plane, which covered the route in 2 hours, 10 minutes, and 24 seconds, and the second K. E. Whyte, in a DH Gypsy Moth, whose record was 3 hours and 20 seconds. The Los Angeles-to-Cleveland non-stop race, with a cash prize of \$5000, was won by Henry J. Brown in a Lockheed Air Express plane, with Hornet engine, with a record of 13 hours, 15 minutes, and 7 seconds, at the rate of 156.2 miles per hour. The Cleveland-to-Pittsburg race for women was won by Miss Gladys O'Donnell in

an elapsed time of 46 minutes and 5 seconds, Mrs. Louise McPhetridge Thaden finishing second, accomplishing the distance in 50 minutes and 4 seconds.

Among the most important of the 35 closed-circuit races was the pursuit-plane race of 8 laps over a 10-mile course for the John L. Mitchell Trophy. The winner was Lieut. P. B. Wurtmith, whose record was 36 minutes and 68 seconds at an average speed of 152.17 miles per hour. Two other military competitions of special interest, each consisting of 8 laps over a 10-mile course, were the Mason M. Patrick Trophy race and the Marine Corps race. The former was won by Lieut. Ivan M. Palmer, who in the seventh lap attained an average speed of 154 miles per hour, and the latter, by Lieut. Haynes Bowden, who covered the route in 30 minutes and 46.4 seconds, at an average speed of 142.88 miles per hour.

The Liberty Engine Builders' Trophy race, over a 9.16-mile, 8-lap course, was won by J. K. Gill at an average speed of 132.72 miles per hour, while the race open to planes powered with engines of 720 cubic inches displacement or less, over a 50-mile course, was won by Errett Williams in his J-6 Eaglerock Bullet at an average speed of 134.58 miles per hour. The 50-mile race for planes with engines of not more than 100 cubic inches displacement was won by E. B. Heath in a Heath Super Parasol monoplane powered by a Bristol Cherub engine, his record being 47 minutes and 41.3 seconds, at an average speed of 62.91 miles per hour. The first prize in the light airplane speed and efficiency contest, open to planes powered by engines of 275 cubic inches displacement or less, was awarded to H. A. Speer who flew a Barling NB-3 low-wing monoplane powered by a Genet engine, his elapsed time over the 50-mile course being 28 minutes and 34 seconds and his average speed, 105.02 miles per hour.

The race for women contestants over a 50-mile course, using planes powered with engines of 510 cubic inches displacement or less, was won by Mrs. Keith Miller, who flew a Fleet biplane powered with a Kinner K-5 engine, at an average speed of 98.73 miles per hour, in 30 minutes and 33.2 seconds. This race marked the first appearance in the United States of women pilots in closed course racing.

Two races were held for open-cockpit and cabin planes powered with engines of not more than 800 cubic inches piston displacement. The open-cockpit plane race was won by C. W. Holman, who in a Laird plane with a Wright J-4 engine covered the course at an average speed of 150.61 miles per hour, the cabin-plane race was won by R. W. Cantwell, in a Lockheed Vega plane with a record of 23 minutes and 38.5 seconds, at an average speed of 152.27 miles per hour. The Detroit News 80-mile transport and efficiency race was won by George Haldeman, in a Bellanca CH-300 plane, his record being 36 minutes and 39 seconds, at an average speed of 119.97 miles per hour. The free-for-all race, open to aircraft of any type, was won by Douglas Davis in the Travel Air Mystery plane, which at an average speed of 194.9 miles per hour over the 50-mile course, defeated the fast Army and Navy planes in an elapsed time of 14 minutes and 5.9 seconds. Second place went to Lieut. R. G. Breene of the Army, who flew a Curtiss P-3-A plane in an elapsed time of 14 minutes and 42.4 seconds, at a speed of 186.84 miles per hour.

**AIRPLANE AND SEAPLANE RECORDS During 1929**  
 a number of new airplane records were made which indicated the continued advance of aviation. The airline-distance record of 6294 kilometers (3911 miles) established by Clarence Chamberlin, when he flew from Roosevelt Field to Isleben, Germany, June 4-6, 1927, was broken by the French pilots, Coste and Bellonte, who on Sept. 27-29, 1929, flew in a Breguet-19 plane from Le Bourget to Coulart, China, a distance of 7905.14 kilometers (4948.59 miles). The altitude record for airplanes was attained by Lieut. Apollo Soucek, U. S. N., who on May 8 at Anacostia, D. C., reached a height of 11,930 meters (39,140 feet). This record, however, was supplanted on May 25 at Dessau, Germany, by Willy Neuenhofen, who in a Junkers W-34 monoplane equipped with a Bristol-Jupiter engine of 420 horse power reached a height of 12,739 meters (41,795 feet). For speed for specified distances without pay load, Commandants Girler and Weiss secured the 5000-kilometer record at Etampes, France, May 24-25 in a Breguet plane equipped with a Hispano-Suiza engine of 600 horse power, the speed record which they established was 188.09 kilometers (116.82 miles) per hour.

For airplanes with a pay load of 500 kilograms (1102.31 pounds), J. Burtin, the French pilot, made an altitude record of 9374 meters (30,654 feet) at Toussus-le-Noble on August 23 in a Breguet-19 plane equipped with a Fairman engine of 500 horse power. The altitude record for airplanes with a pay load of 1000 kilograms (2204.12 pounds) also was established by Burtin in his Breguet-19 plane, when, on July 26 at Toussus-le-Noble, he reached a height of 8089 meters (26,538 feet). On the same date at the Metropolitan Airport, Los Angeles, Waldo Waterman attained an altitude record of 6346 meters (20,820 feet), in a Bach landplane with a Wright J-6 motor. The duration record for an airplane refueling in flight, 420 hours and 17 minutes, was made by Dale Jackson and Forest O'Brien in the *St. Louis Robin No. 1* equipped with a Curtiss-Robertson radial engine of 170 horse power at Lambert Field, St. Louis, July 13-30.

Several new records also were established for light planes. In the first category for two seaters weighing empty less than 400 kilograms (881 pounds), the closed-circuit distance record of 1601 kilometers (993 miles) was established by Cornelius Edvard at Bremen, Germany, on August 20, in a Focke-Wulf S-24 plane equipped with a "Kiebitz" Siemens 80-h.p. motor. In the second category for single seaters weighing empty less than 200 kilograms (440 pounds), the altitude record of 4404 meters (14,454 feet) was established by Lieut. F. H. Zwiakoff, A. Kocjan at Varsovie, Poland, on October 19, in the RWD-2 equipped with a Salmon engine of 40 horse power. In the third category for single seaters weighing empty 200-350 kilograms (440-771 pounds), the airline distance record of 2655 kilometers (1650 miles) was established by D. S. Zimmerley, who, on July 17 in a Barling NB-3 landplane, equipped with a 60-h.p. LeBlond engine flew from Brownsville, Tex., to Winnipeg City, Canada. The altitude record in this category also was attained by Zimmerley in a Barling NB-3 plane equipped with a Genet engine of 80 horse power, which, on May 28 at Parks Airport, East St. Louis, Ill., reached a height of 6346 meters (20,820 feet).

In the class for seaplanes returning to point of departure without refueling, Lieut. Apollo Soucek, U. S. N., in the Wright plane *Apache*, equipped with a Pratt & Whitney engine of 425 horse power, attained at Washington on June 4 an altitude record of 11,753 meters (38,555 feet). This was the plane he had used before, but it was equipped with pontoons. The maximum speed for seaplanes in this category was established by Squadron-Leader A. H. Orlebar in the Supermarine Rola-Royce S-6 at Spithead, England, on September 12, when he attained a record of 575.7 kilometers (357.72 miles) per hour.

The speed record for seaplanes covering a distance of 100 kilometers was established at Spithead, England, on September 7 by Flying-Officer H. R. D. Waghorn, who in the Supermarine monoplane Rola-Royce S-6 made a record of 531.2 kilometers (330.7 miles) per hour. On June 10 at Warnemunde, Germany, Rolf Starke in a Heinkel HE-9 plane, equipped with a BMW VI engine of 600 horse power, established the speed record of 222.27 kilometers (138.11 miles) per hour for seaplanes over a distance of 100 kilometers.

The German pilot, Rolf Starke, secured all five records in trials held at Warnemunde on May 7, May 21, and June 10, to establish specified distance-speed records for seaplanes carrying a pay load of 500 kilograms (1102.31 pounds) and 1000 kilograms (2204.62 pounds). In the 100-kilometer class in the first category, a speed of 259.92 kilometers (161.51 miles) per hour was established, in the 500-kilometer class, 235.94 kilometers (146.6 miles) per hour, and in the 1000-kilometer class, 222.27 kilometers (138.11 miles) per hour. The speed record established for 100 kilometers in the second category was 235.29 kilometers (146.2 miles) per hour and for the 500-kilometer race, 235.94 kilometers (146.6 miles) per hour. In each instance Heinkel Planes equipped with BMW-6 engines of 600 horse power were used. The altitude record for seaplanes with a pay load of 2000 kilograms (4409.24 pounds) was made on May 15 at St. Raphael by the French pilot, Lieut. de Vasseau, Paris, who in a C. A. M. S. plane equipped with a Hispano-Suiza engine of 600 horse power reached a height of 4827 meters (15,837 feet). The greatest pay load carried to an altitude of 2000 meters (6561.7 feet) was 6450 kilograms (14,220 pounds) in the Rohrbach plane *Romar*, equipped with a 3-BMW engine of 500 horse power at Travenmunde, Germany, on April 17.

**BALLOON RECORDS** A new balloon distance record for the fifth category of balloons (1601-2200 cubic meters), the sixth (2201-3000), the seventh (3001-4000), and the eighth (4001-5000) was established by Lieut. T. G. W. Settle, U. S. N., and Ensign W. Bushnell, U. S. N., who on May 4 flew from Pittsburgh to Savage Harbor, Prince Edward Island, Canada, a distance of 952 miles, in the course of the National Balloon Race in the United States, described above.

**GLIDER RECORDS** Glider records for the year were established by Johannes Nehring, on April 25 at Bergstrasse, Germany, when in the glider *Darmstadt* he attained an altitude record of 1209 meters (3940 feet) and flew in a straight line from Frankenstein to Ubstadt, a distance of 72.2 kilometers (44.86 miles).

**COMMERCIAL AVIATION.** That air transportation had become an indispensable adjunct to commerce and industry seemed clearly demonstrated by the end of 1929. While there were but few

marked developments in Europe during the year, the condition in the United States in this respect had materially improved. Not only were a number of spectacular achievements recorded and the amount of actual flying increased, but the daily scheduled operations indicated that a number of apparently insuperable obstacles had been overcome and that in this respect the United States was leading all nations. In fact, all phases of commercial aeronautics in 1929 continued to grow at an average rate of about 60 per cent and the scheduled air-transport planes were flying over 90,000 miles per day. These scheduled operations, however, constituted less than 15 per cent of the total mileage flown in the United States. Both on the operating side and on the manufacturing side, there has been rapid expansion in the industry, so much so, in fact, that in some quarters it was feared that this growth had been too hasty, as in some cases, due to overproduction and inadequacy of capital, distress and embarrassment had resulted.

When it was realized that 40,000 passengers were carried in the first six months of 1929, as against 35,000 in the entire year of 1928, and that the number of airplanes manufactured and the planes exported had experienced a remarkable increase, it was natural for the investing public to become enthusiastic. Aviation securities that enjoyed a boom suffered in the general decline following the financial situation of October and many investors lost heavily in the shrinkage of values.

It was inevitable that the inadequately financed and inexperienced manufacturers and operators should go to the wall, but there seemed to be no reason why strong companies, both manufacturing and operating, should not succeed in view of the increasing popular interest in this field. For it must be remembered that, by 1929, the United States was leading in the industrial application of the airplane, such as aerial surveying, aerial photography, cotton dusting, and fire patrol and, in addition on a very large basis, in the transportation of air mail and express. The United States also led in the private ownership and operation of airplanes for various purposes, and it was inferior only in the carrying of passengers, which was due to a number of special circumstances, as well as to lack of government subsidies such as were provided in Europe.

At the end of the year 1929, the United States was far in advance of the other countries of the world in extending and developing its air routes. Carrying out plans that had been made in the previous year, a network of air routes, connecting the air lines linking the various major American cities, was developed and regularly scheduled passenger service conducted between all important points, either in connection with other air lines or with railway companies as the various air routes were extended. Terminals were quite generally provided and useful measures were adopted to secure traffic. In 1928 the United States operated 16,667 miles of airways, as compared with 15,540 miles for Germany, a country which led Europe in this respect, as France had in this year 14,894 miles of such air routes. In 1929 the United States had increased its air routes to 35,000 miles, while no European country during that year had made any substantial increase. As a result, the United States was operating more miles of air route and flying more passenger miles than any other two countries together.

Passenger carrying in the United States jumped from 49,713 in 1928 to approximately 85,000 for 1929, but was still behind Germany which had approximately 115,000 passengers, the same figure as for 1928, when French commercial airplanes carried 16,698 passengers, 287,160 pounds of mail, and 2,529,880 pounds of freight, having a record of some 4,506,000 miles of flying. The French, however, were seeking to extend their air activity and late in 1929 it was proposed that French and Swiss airplanes should meet American steamers at Cherbourg to expedite the forwarding of specially stamped mail to Paris and Basel, and other points.

In air mail in 1929, the United States carried 8,000,000 pounds, as against less than 2,000,000 pounds carried by France. The air-mail net work had been well arranged in 1929, so that fewer new mail routes were necessary.

In addition to an increased number of all-air lines developed during the year, important air-and-rail services were inaugurated. On July 7, the Transcontinental Air Transport, in cooperation with the Pennsylvania Railroad and the Atchison, Topeka & Santa Fe Railroad, inaugurated a 48-hour passenger service between New York and Los Angeles, utilizing tri-motored Ford, all-metal planes with a capacity for 17 passengers. On July 12, the Universal Aviation Corporation, in connection with the New York Central Railroad and the Atchison, Topeka & Santa Fe Railroad, established a coast-to-coast service, making use of Fokker tri-motor planes. In the autumn of 1929, it was stated that there were 44 companies in the United States giving passenger service, while the Universal Aviation Corporation and the Western Air Express, acting together, were planning to fly passengers from coast to coast in about 30 hours. Already on April 30, a coast-to-coast airline had made a commercial flight test in 31 hours.

With the notable increase in passenger air-transportation service, there was also an increase of municipal airports, though unfortunately in the latter respect some of the larger cities, such as New York, were not as favorably equipped as others. An example of this condition was indicated by the statement that an airplane passenger from New York to Boston spends 45 minutes in a bus from the Hotel Pennsylvania to the transportation company's airport in Newark and 35 minutes from the Statler Hotel in Boston to the airport there, while the trip in the air requires but one hour and 45 minutes, making three hours and five minutes for the entire trip. At the end of the year, however, there were 948 equipped airports exclusive of Federal fields, which included would bring the total to 1554. New construction under way was expected to involve a total cost of between \$45,000,000 and \$50,000,000.

In connection with the economic side of commercial flying, and this was becoming increasingly important, the matter of rates at the end of the year figured on a more important basis than ever before. Many of the operators seemed convinced that the public was unwilling to pay on a much greater scale than for existing methods of transportation and that a distinct effort must be made to compete vigorously on the basis of present rates and service rendered. In several of the larger cities, air transportation to many distant points was available by one company which announced that it would carry passengers at a flat rate of 25 cents a mile.

The safety of air transportation in the United States in 1929 was indicated by the fact that, in the first six months of the year, there was but one death for approximately 1,000,000 miles flown. In the latter half of the year, a serious accident, when the regular service airplane *City of San Francisco* was wrecked on September 3 by striking a mountain in New Mexico, and several minor mishaps acted slightly to reduce the safety ratio. The accident mentioned resulted in the deaths of five passengers and three of the crew. The public gradually, however, was gaining confidence, and the hazards were ceasing to be as serious considerations as in the earlier years of commercial flight and transcontinental flying. Nevertheless, the operating companies made every effort to provide maximum safety, enjoying in this respect the cooperation of the U. S. Department of Commerce and other government departments. In connection with the extensive use of airways in the United States, the U. S. Weather Bureau inaugurated an hourly weather broadcast for aviators along the leading air routes with a half-hourly service between certain terminal points. On the transcontinental planes, a radio directional installation to the pilot, and there is radio communication with ground stations.

**AMERICAN AIR TRANSPORT** The Aeronautical Chamber of Commerce of America, Inc. in a report published in *The Aircraft Year Book for 1930*, stated that civilian, commercial, and government planes flew 197,546,690 miles during the year 1929, which was sufficient to establish the United States as the leading nation in air transport operations. An important development was that civilian and commercial flight was more than three times as great as military and government activities. Planes in the former class covered 149,579,451 miles, as compared to 47,967,139 miles for military and official activities. Another striking feature was that America's major air transport lines, operating on regular schedules, flew more than 20,000,000 miles during the year, carried more than 7,000,000 pounds of mail, and transported more than 165,000 passengers. Every 24 hours, passengers, mail, and express were being flown over 90,000 miles and a territory of . . . population was being served. Scheduled transport lines were flying one-third of this distance on lighted airways between dusk and dawn, the United States being far better provided than any other country in this respect. Consolidations of air transport operators reduced the number from 32 to 27, but there were 619 planes in such service, as against 294 in the previous year. These 27 major transport operators flew 20,242,891 miles in 1929, as compared with 10,472,024 miles in 1928. Likewise, . . . business increased, with 165,263 . . . on all lines in 1929, as against 52,934 in 1928. In 1929 7,096,930 pounds of mail were carried, as against 3,632,059 pounds in 1928 and 1,222,843 pounds in 1927. Express matter was beginning to be an important item, with 197,538 pounds reported. Mail and express lines flew a total of 13,344,172 miles in 1929 and passengers, a total of 14,889,850 miles, these figures referring only to scheduled operations on regular lines and not including short hops or chartered flights.

Statistical estimates of the Aeronautical Chamber of Commerce, Inc., based on reports of typical operators and computed to include aerial service operators in the United States, indicated that their planes flew 104,330,560 miles and carried

2,995,530 passengers. Private flying in the United States increased from 12,000,000 to 25,000,000 miles. The average passenger rate per mile on the established air-transport lines was 10.6 cents per mile during 1929, but toward the end of the year, most of the lines contemplated for 1930 radical cuts which indicated a far lower average rate. Of the 27 major lines, eight carried passengers exclusively, three air mail and express exclusively, and the others, both passengers and mail. In their services, 620 planes were employed, of which 594 were land planes, 7, seaplanes, and 19, amphibians. There were 480 single engined planes, 17 had twin-engines, and 122 were tri-motored planes. The personnel employed on these 27 lines totaled 2867 persons, of which 372 were pilots and 1425 mechanics or ground personnel, it having been demonstrated that about eight men were needed on the ground for every pilot in the air.

**AIRCRAFT INDUSTRY** The extent of the American Aircraft Industry is indicated in the annual production report of the Aeronautical Chamber of Commerce of America, Inc., which stated that airplanes and engines valued at \$98,000,000 were produced during 1929. Twenty-five aircraft engine manufacturers reported a total of 7378 engines produced in 1929 for both military and commercial use, representing a total valuation of \$26,495,830.15. The 96 major manufacturers reported a value of \$44,457,300.60 for 6034 commercial and military airplanes built during the year. The Aeronautical Chamber of Commerce added the appropriate value for spare parts, so that its estimate of \$98,000,000 was attained and could be compared with \$62,000,000 in 1928. An interesting feature of the American industry was that of 7378 engines manufactured, 5517 were taken by commercial interests, as against 1861 for military service. Commercial engines represented a total value of \$17,895,300 and military motors, \$8,000,530.15. These 1929 figures, compared with the previous year, indicated an increase in commercial production of 3607 units or 193 per cent, while military production increased by 448 units, or an increase of 32 per cent. It was further interesting to note that commercial aircraft engine production showed an average unit price of \$3243.65 during 1929, as compared with \$4830.65 in 1928. The average unit value of all types of aircraft including motors was \$9620 in 1929, as compared with \$11,111 in 1928. Most of the engines produced were about 300 horse power with 1404 motors being so rated, while the next to largest number was in the class between 76 and 125 horse power, with 1309 units so classed. Between 126 and 175 horse power, there were 1208 engines, while below 75 horse power, there were 479 engines.

The exports of aircraft and aircraft accessories in 1929 showed a considerable increase over the previous year. There were exported in 1929, 354 machines, valued at \$5,574,480, as compared with 162 machines valued at \$1,759,653 in 1928. Engines exported in 1929 totaled 321, valued at \$1,375,697, as against 179, valued at \$664,826 in 1928. Exports of parts in 1929 were valued at \$2,252,208, as against \$1,240,244 in 1928.

**GUGGENHEIM FUND** It was announced that the Daniel Guggenheim Fund for the Promotion of Aeronautics would terminate its existence at the end of the year, having been responsible for the disposal of \$3,000,000 since it was established in January, 1926, with an initial donation of \$2,500,000 made by the foundation. The extra \$500,000

given to the fund during the year by Mr. Guggenheim was to be used for the equipment of an Airship Institute in Akron, Ohio, the foundation of an aeronautical engineering school in the South, and the organization of a complete aeronautical library for the Library of Congress. A sum of \$250,000 was to be given to the city of Akron and the California Institute of Technology for an Airship Institute to be supervised by the latter, so that, among other subjects, research in lighter-than-air development might be undertaken. For a chair in the Library of Congress, \$140,000 was to be appropriated. Various educational institutions received gifts, such as \$30,000 to provide supplementary equipment for the aerial photographic survey and mapping center of Syracuse University. Approximately \$1,200,000 was appropriated, after the fund was inaugurated, for aerial activities at the California Institute of Technology, the Massachusetts Institute of Technology, Stanford University, the University of Michigan, and the University of Washington. Various grants were made to European societies. The blind-flying test of Lieut. James Doolittle described above was made possible by the Guggenheim Fund, which established and operated a trial weather-reporting system on the San Francisco-Los Angeles airway. The fund also established the safe aircraft competition, sponsored the National Safety Conference, and assisted in the movement for air markings of towns and cities.

**DANIEL GUGGENHEIM SAFE AIRCRAFT COMPETITION.** This notable competition, which had been announced in 1927 with the aim of developing and discovering safer airplanes, was held in November and December, 1929. The conditions for this competition have been indicated in previous YEAR BOOKS. Prizes totaling \$150,000 made the competition worth while for designers and manufacturers. At the end of the year, it was stated that the \$100,000 prize had been awarded to the Curtiss *Tanager*, a large biplane of the cabin type carrying a pilot and passenger in tandem within the inclosure. It was equipped with a Curtiss Challenger engine, with which during the year the world's endurance record was made. The wings were equipped with a modification of the Handley Page slot, while in addition, flaps, the hinged rear portion of the wings, were individually and manually operated so that their position could be fixed in any position by means of a chain gear at the will of the pilot. The landing gear employed the familiar combination of rubber in composition and a long-travel oleo gear permitting of a landing-gear travel of more than one foot. The travel of the shock absorbers is restricted in taking off, so as to assure the landing gear leaving the ground in the shortest possible distance, and the gear is placed in full action before landing, so as to secure full use of the shock absorber. The full floating ailerons of the wing-tip design which are placed at the tips of the lower wings floating and in a free position trail at a zero angle with the relative wind, being, however, individually operated around this trailing position. There is an aileron control independent of the wings, so that whether the wings are stalled or not they are never in a stalling condition though always being displaced from the zero angle.

The Guggenheim Competition originally attracted the interest of 27 manufacturers, but only 15 eventually presented planes for testing

at Mitchel Field, and of these, 6 withdrew. Another entry failed to arrive within the specified time. During the period of test, there were two major crashes resulting in the almost complete destruction of planes yet without injury to the pilots. The competition unfortunately was somewhat restricted and in some ways a disappointment to the sponsors of the original project, but it did indicate progress toward greater safety and the field in which further advances must be made.

The winning *Tanager* was able to come to a complete stop within 100 feet of the spot where it first touched the ground on landing, and likewise it was able to take off after a run of less than 300 feet and then clear a 35-foot obstruction 500 feet from the starting point. The pilot was able to remove his hands from the control for five minutes or more and the plane demonstrated that it could recover automatically from sudden air disturbances. The plane showed also that, in the event of engine failure on a steep climb, no abnormal position followed by a nose dive would result, but that the plane would descend in a steady, easy glide without intervention of the pilot. The *Tanager* was found capable of gliding with all power shut off and at a speed not exceeding 38 miles per hour. The only serious rival to the *Tanager* in the Guggenheim Competition was the British Handley Page plane.

**BIBLIOGRAPHY.** Among the notable books of the year in various fields of aeronautics were the following: Klemm, *If You Want to Fly* (New York); Black, *Civil Airports and Airways* (New York); and *Transport Aviation* (New York); Munk, *Fundamentals of Fluid Dynamics for Aircraft Designers* (New York); Wooley and Hill, *Airplane Transportation* (Hollywood, Calif.); Monteth, *Simple Aero-dynamics and the Airplane* (New York); Harper, *Twenty-five Years of Flying* (London); Yancey, *Aerial Navigation and Meteorology* (New York); Bennett, *Aviation: Its Commercial and Financial Aspects* (New York); Page, *Modern Aviation Engines* (New York); Studley, *How to Fly* (New York); Ramsey, *Navigation of Aircraft* (New York); Burney, *The World, The Air and the Future* (London); Colvin and Colvin, *Aircraft Handbook* (4th ed., New York); Grey, Bridgman and Flanders, *All the World's Aircraft of 1929* (London); Goldstrom, *A Narrative History of Aviation* (New York). The Aeronautical Chamber of Commerce of America, as usual, published *The Aircraft Year Book for 1929* (New York), containing a full summary of recent developments in aviation, and it summarized in its 1930 issue the activities of 1929. See also **MILITARY PROGRESS**, **NAVAL PROGRESS**; and **PHOTOGRAPHY**.

**AFGHANISTAN**, af-gān'-i-stān'. An independent kingdom of Asia between the parallels 29° and 38° 20' north latitude and 61° and 72° east longitude with a narrow strip extending to 75° east. The estimates of the area vary from 245,000 to 270,000 square miles. The population is estimated at about 12,000,000, although some authorities place it at about half that number. Ruler after October, 1929, Nadir Khan, Capital, Kabul, with a population of about 100,000.

Other important towns are Kandahar (80,000), Herat (121,000), and Mazar-i-Sharif (46,200). The Afghan is the dominant race and the chief tribes are the Durrani and the Ghilzai, numbering about 2,200,000. The prevailing languages

are Persian and Pushtoo and the dominant religion is Islam.

Afghanistan's natural resources are but little known, as the area has not been carefully surveyed and prospected. The northern part is said to be fairly rich in copper, and lead is found in several sections. A gold mine was operated at Kandahar under the supervision of a British mining expert, and precious stones, particularly lapis lazuli, are found. Manufacturing of the cottage-industry type is carried on throughout the country, making soap, cloth, boots, and certain other articles for local consumption. Carpets are made both for domestic consumption and for export. Until within the last few years, Afghanistan has been almost completely isolated from the remainder of the world, but under the leadership of King Amanullah, rapid strides were made in opening the country to international trade and intercourse. The construction of an automobile road from Kabul to the Indian frontier was half completed when interrupted by the revolution in November, 1928.

The most convenient means of reaching Afghanistan from the outside world is through British Indian ports, as the country has no seaport of its own. India's trade with Afghanistan averages about \$15,000,000 in normal years. Cotton goods, indigo, sugar, hardware, leather, silver, and automobiles are taken by Afghanistan in exchange for carpets, timber, fruits, vegetables, several kinds of nuts, wool, spices, silk, hides, cattle, tobacco, pulse, ghee, asafoetida, and other drugs. Many of the commodities passing from India to Afghanistan are of foreign manufacture, and a good proportion of the import from Afghanistan is designed for reexport to Europe and the United States.

From 1922 to early in 1929, Afghanistan was a constitutional monarchy with legislative and state assemblies, and a cabinet presided over by the King. Administratively, the country was divided into five major and four minor provinces, each ruled by a governor. The total revenue was estimated at about 50,000,000 rupees annually. Amanullah Khan ascended the throne as Amir when his father was assassinated in 1919. In 1926 he changed his title from Amir to King. He was forced to abdicate Jan. 14, 1929, and was succeeded by Habibullah Ghazi, whose brief régime was ended in October when Nadir Khan ascended the throne. Constitutional government was then reestablished.

**HISTORY.** Afghanistan remained in a state of civil war until November, 1929. The revolt which broke out against King Amanullah in November, 1928, following his return from his European tour and his inauguration of drastic social, economic, and religious reforms based on the Western model, resulted in his forced abdication on Jan. 14, 1929. Designating his elder brother, the Sirdar Inayatullah Khan, as his successor, Amanullah escaped to Kandahar. The rebelling tribesmen refused to recognize Inayatullah, however, and he in turn was forced to flee while the rebel leader, Bacha-i-Sagoo, assumed power in Kabul, January 17, under the title of Habibullah Ghazi. The evacuation of foreigners from Kabul, including diplomatic representatives of various countries, by the British Royal Air Force continued from Dec. 23, 1928 to February 25, some 580 persons being transported to India by eight planes in eighty flights without any casualties. On January 29, Amanullah rescinded his ab-

dication and organized an army at Kandahar with the aid of a Turkish Military Mission and sixty Afghan officers, who had studied with the Turkish army. Early in April, he marched toward Ghazni but was defeated south of that point about April 19 and on May 23 left the country with former Queen Surruja, his brother, Inayatullah, and a considerable retinue. They went to Rome, Amanullah taking up residence in the Afghan Legation there. In the meantime Gen. Nadir Khan, uncle of Amanullah and his former Minister of War, had raised an army with which he defeated Habibullah and, on October 6, captured Kabul. Habibullah held out in the citadel for two days after the fall of the city, it was reported, brutally murdering several members of the royal family whom he held as hostages. He then escaped to Fort Jebel Serai, where he was captured on October 23. Nadir Khan waited outside of Kabul until the citadel was reduced by his brother, the Sirdar Shah Wali Khan, and then made a formal entry with his tribal allies. A solemn service of thanksgiving was held in the throne room of the royal palace at which the spokesmen of the tribes urged Nadir Khan to accept the crown. He at first refused, urging that a king be chosen at a later meeting of the National Assembly, but the tribesmen insisted upon his acceptance, threatening to leave the city if he refused. He finally consented and the government which he established was recognized in November by Great Britain and other leading powers, after his authority had been extended by the capture of Kandahar and Jellalabad. The latter city was reported badly damaged by a magazine explosion.

King Nadir, or Nadir Shah as he was addressed by the British government in extending recognition, was born in 1880. He was a relative of former King Amanullah by marriage and was commander-in-chief of the Afghan army in 1919 and later Minister of War. In October, 1924, he became Afghan Minister to France, resigning that post in 1926 on grounds of ill health. He made his residence in France until the revolt against Amanullah caused him to return to his native country. With two of his four brothers, he reached Bombay in February, 1929, and entered Afghanistan from Peshawar in March to relieve another brother, Sirdar Shah Mahmud Khan, who was holding out against Amir Habibullah. His final defeat of Habibullah was accomplished only after three reverses, which forced him temporarily to postpone his offensives. One of his first acts upon becoming King was to appoint his brother, Muhamed Azis Khan, as Minister to Soviet Russia, indicating an apparent desire to cultivate friendly relations with the Soviet Union.

Habibullah was executed following his capture, King Nadir having left his fate to the decision of twelve ministers and other officials. They condemned him to death for "ruining the government, murdering thousands of Moslems, looting homes, disgracing Moslem women, and squandering the contents of the treasury," according to dispatches from Kabul.

Amanullah, by sending a telegram of congratulation to Nadir Khan from Rome, indicated his acceptance of the new régime. It was reported that he would become Afghan Minister to Rome.

In December, it was reported from Peshawar, India, that King Nadir had appointed a ministry headed by Sirdar Mohammed Hashim Khan and was making important progress in pacifying cer-

tain still rebellious tribes, organizing a regular army, raising funds, and recovering government arms from the tribesmen

**AFRICA.** The various divisions of Africa in this volume are discussed under their own heads. See articles on the respective countries and territories, including ETHIOPIA, KENYA, EGYPT, MOROCCO; TUNIS, SOUTH AFRICA, UNION OF, etc. See also the articles ANTHROPOLOGY, ARCHAEOLOGY, and EXPLORATION

**AGNES SCOTT COLLEGE.** An institution for the higher education of women in Decatur, Ga., founded in 1889. The enrollment for the autumn of 1929 was 456, distributed as follows: Freshmen, 161, sophomores, 101, juniors, 98, seniors, 96. The faculty numbered 51 members, and the officers of administration, 14. The endowment amounted to \$1,182,941, while the gross income for the year was \$356,369. There were 20,142 volumes in the library. During 1929 a central steam plant was erected at a cost of approximately \$150,000 and a contract was let for the construction of an administration and classroom building to cost about \$315,000. The General Education Board of New York offered the college \$500,000 for the furtherance of its building and endowment programme, if friends of the institution would complete the raising of \$1,000,000 for this purpose. President, James Ross McCain, Ph.D., LL.D.

**AGRAMONTE** (MONTGOMERY Y AGRAMONTE), GEN. CHARLES HORACE. American soldier and lawyer, died in Mexico City, Mar. 14, 1929. Born in Havana, Cuba, Sept. 19, 1830, he attended schools in France. Choosing the career of a soldier, he served in the Crimean War with the British General Staff, fought against Nana Sahib and the Sepoys in the Indian Mutiny, joined in the relief of Lucknow, and took part in the Maori Rebellion in New Zealand. On his return to the United States, he served with the Union Army during the Civil War, and was active in the 10 years' war for Cuban independence. General Agramonte was twice decorated by the French Legion of Honor. Having settled in Mexico, in 1914, he resumed the law practice which he had previously followed, and in which he worked until his death, being a leader in the American colony at Mexico City.

**AGRICULTURAL EXPERIMENT STATIONS.** The national system of agricultural experiment stations continued to develop during the year in each State of the United States and in the territories of Alaska and Hawaii and the insular possessions, Porto Rico, Guam, and Virgin Islands. Of more than \$15,000,000 available for their maintenance, the Federal Government furnished \$4,086,400, which included an additional \$480,000 provided by the Purnell Act of 1925. The remainder, coming from State appropriations and allotments, fees and sales, shows that, as in the past, the Federal funds were very liberally supplemented. In four years, the State appropriations had increased about 50 per cent, practically paralleling the increase in the Federal appropriations. The funds for the support of experiment stations maintained by the U. S. Department of Agriculture in Alaska, Hawaii, Porto Rico, Guam, and Virgin Islands aggregated \$246,000.

A number of important additions to buildings, equipment, and land were provided by the several States and others were authorized. Among nearly 7000 research projects at the stations, 447 were

active under the Adams fund and 1186 under the Purnell fund. Increase of the regular personnel of the stations brought the number over 3000. Only one change occurred in directorship, the director of the California Station resigning.

The Hawaiian Agricultural Experiment Station, resulting from the union of the Federal Experiment Station and the station of the University of Hawaii, was to be conducted jointly by the U. S. Department of Agriculture and the university. The merger of the two institutions was a consequence of the Act of Congress, approved May 16, 1928, authorizing the Territory of Hawaii to share in the Hatch and supplementary acts. The director of the Federal station became director of the joint institution and the research staff includes all former members of the staff of the Federal station and also a number of specialists from the university faculty. The Territorial Legislature appropriated \$5000 for a research station in the Kona coffee district of the island of Hawaii, to be operated in connection with the main station.

Congress, in an act approved Feb. 23, 1929, extended the Hatch Act to Alaska, with a proviso that no appropriations should be made under the act until the Secretary of Agriculture should determine the ability of the Territory to use the funds effectively. A bill introduced in the Legislature of Alaska that would meet the conditions laid down by the Secretary of Agriculture failed of passage.

The Georgia station and the Virginia truck station occupied new administration buildings having facilities for laboratories. The Louisiana station completed a new dairy building with space for research in dairy manufacture and production. A new substation was established at St. Joseph, Texas, Parish, in the delta section of Louisiana. As a part of a comprehensive building programme the University of Kentucky erected a dairy-products building on the station farm.

The new life science building under construction at the University of California at a cost of about \$1,750,000 was to provide space for the division of plant nutrition of the station. A poultry plant was built and equipped at a cost of \$80,000. The regents of the university were authorized to use \$125,000 for an addition to the main building of the citrus experiment station at Riverside and \$150,000 for a building for sub-tropical horticulture on the new campus of the university at Los Angeles.

In Pennsylvania, the legislature appropriated \$6,311,000 for the State College, of which \$300,000 is for agricultural research, \$650,000 for agricultural and home economics extension, and \$2,250,000 for new buildings. Kansas State appropriations provided an increase of from \$87,450 to \$106,500 for the four substations.

A gift of \$1,500,000 was tendered Cornell University by the General Education Board, upon condition of its duplication by the university within one year, for the establishment of a research foundation, ultimately to require \$9,000,000. The plan contemplates the strengthening of research in physics, chemistry, and biology by the creation of a centre of research in general physiology. Funds were made available for an animal nutrition research laboratory and for additional field buildings in the experimental orchard and at the experimental vegetable gardens. The plant industry building, being erected, was to cost over \$1,000,000.

**NECROLOGY.** The personnel of the stations suffered a number of losses through death. Robert R. Dinwiddie, long associated with the veterinary work of the Arkansas station, James W. McColloch, professor of entomology and investigator at the Kansas station, Henry D. Hooker, a horticulturist of note at the Missouri station, William H. Wright, at the Wisconsin station, John C. V. N. at the department of animal husbandry of the New Hampshire station, Thomas R. Osborne, for 42 years connected with chemical work at the Connecticut station, and Frank H. Hall, who was research associate at the New York State station, the first experiment-station editor appointed in the United States and introducer of the popular bulletin series, died during 1929. Members of the staff of the U. S. Department of Agriculture, having important contacts with the stations, dying during the year, included Alfred C. True, former chief of the Office of Experiment Stations and an outstanding leader in agricultural education and research, and Edwin W. Allen, chief of the Office of Experiment Stations. In England, Thomas Ballow Wood, professor of Agriculture at the University of Cambridge, noted for his research in animal nutrition, died Nov. 6, 1929.

**BRITISH EMPIRE** Developments in agricultural research in the British Empire looking toward the organization of fundamental research on an empire-wide basis and a very extensive scale have proceeded under the sponsorship of the Empire Marketing Board and other bodies. From July, 1926, to May, 1928, allotments of over £1,000,000 were made for research projects and institutions, with supplementary funds from local contributions often equivalent to the imperial grants. Other phases contemplated included a series of imperial clearing stations for specific branches of research, a chain of central tropical and subtropical research stations, a colonial advisory council of agriculture and animal health to coordinate agricultural research in non-self-governing dependencies, and the formation of a colonial agricultural service with a specialist wing for research and administration.

Prominent among the research enterprises currently going on under substantial allotments were low-temperature research in Great Britain, Irish Free State, and Trinidad, fruit studies in Sierra Leone and Trinidad, entomological work in New Zealand and Great Britain, investigation of mineral content of pastures in Scotland, Australia, New Zealand, and Southern Rhodesia, animal breeding work in Scotland, and dairy-products research in Scotland and Northern Ireland.

The Australian Commonwealth Council for Scientific and Industrial Research erected a laboratory building at the University of Adelaide, costing about £14,000, and equipped for fundamental biochemical studies of animal nutrition, especially sheep.

The John Rose Laboratory of Waite Institute, South Australia, erected at a cost of £10,000, provides for botanical, chemical, and entomological research.

Albert College at Glasnevin and the accompanying experiment station of the Irish Free State were transferred to the agricultural department recently established in Dublin University.

The Stellenbosch-Elsenburg College of Agriculture, formed by union of the faculty of agri-

culture of the University of Stellenbosch and the Elsenburg School of Agriculture, operated as a part of the University of Stellenbosch, Union of South Africa. An experimental milling and baking plant was completed at Stellenbosch and buildings at Elsenburg and the cereal experiment station at Langgewens, Malmesbury.

The Agricultural Bacteriological Station at Gamans, Southwest Africa, founded by the German Empire and destroyed during the World War, was converted into an agricultural school with a model farm.

The department of agriculture in Albania carried on three experiment stations, which dealt with adaptation work with improved varieties of cereals, root crops and fruits, and livestock.

Consult also *Report on the Agricultural Experiment Stations*, 1928, by E. W. Allen, W. H. Beal, and H. M. Steece, U. S. Department of Agriculture.

#### AGRICULTURAL EXTENSION WORK.

The year marked the twenty-fifth anniversary of the beginning of demonstration work carried on through practical farm demonstrations by the U. S. Department of Agriculture. A celebration of this anniversary was held in Texas, where the first agents were appointed in 1904, and where the first demonstrations of improved farm practices were undertaken under the direction of the Department of Agriculture. The comprehensive national system of cooperative extension work as it now exists, however, was set up under the authority of the Smith-Lever Act of 1914. This system operates on a cooperative basis in the 48 States and the Territory of Hawaii, funds for the work being provided by the county, State, and national governments. Extension agents are employed with headquarters in the rural counties. Through demonstrations, meetings, tours, campaigns, and other teaching activities, these county extension agents carry direct to farmers, farm women, and farm children the latest successful methods of farming and home making.

The trend toward the economic phases of farming became more pronounced during 1929. Plans were formulated to cooperate with the Federal Farm Board, appointed by President Hoover, in furthering the betterment of improving the condition of farmers' cooperative marketing associations. Extension programmes of work were focused more directly than heretofore on larger farm incomes. It was recognized that increased production alone is not sufficient and that in marketing programmes consideration must be taken of underlying economic factors. Agents found it expedient to gather, organize, and interpret facts regarding adequate farm incomes, existing and probable future demand supply, and market prices of farm products, competition with other areas, transportation facilities, and other economic factors. The data accumulated from these studies when used as a basis for extension programmes enabled farmers to adjust the kind, volume, or organization of their farm enterprises to take full advantage of existing economic conditions and thus increase their farm incomes.

Along with the more general recognition of economic factors came a steady increase in the production phases of extension work. As a result of the educational work of extension agents, there were almost a half-million instances in which farmers, farm women, or farm boys and

girls accepted and put into use the practices taught. These practices included practically every phase of farm and home improvement. County agricultural agents featured the building up and maintenance of soil fertility, the production of more home-grown roughage for dairy cows, the control of diseases and pests affecting livestock and crops, better breeding of livestock, improved construction of farm buildings, and the use of high-yielding varieties of seed adapted to local conditions.

The home demonstration agents aided farm women to make their homes more comfortable, attractive, healthful, and efficient. The proper selection, preparation, and preservation of foods to maintain a healthful diet the year round were taught. Women were trained in child welfare, home nursing, and sanitation. They were aided in the making, care, and renovation of clothes, the trimming of hats, repair of furs, and similar features. Business methods were introduced in the home, kitchens were rearranged, modern equipment was utilized, inexpensive but practical lighting, heating, water, and sewage systems were installed, houses were painted, furniture upholstered, flower beds, shrubbery, trees, and lawns were planted, and other improvements in the farm home were adopted through the efforts of the home demonstration agents.

The 4-H Club work with farm boys and girls increased substantially over the previous year. There was little or no change in the projects carried on with these boys and girls. The projects attracting the greatest amount of attention were concerned with dairy and beef cattle, swine, poultry, corn, potatoes, and cotton among the boys, and clothing, food preparation and preservation, poultry, house furnishings, home management, and home gardening among the girls. An encouraging development during the year was the increased popularity among club members of leadership activities. Extension agents and club members continued to look with favor on judging teams and demonstration teams. Such teams and public exhibits showing results obtained through club work in the county were important factors in popularizing and extending the advantage of 4-H Club work to all sections.

In June, the third annual 7-day encampment of 4-H Club members was held in Washington, D. C. Forty States and the Territory of Hawaii sent 150 delegates who were selected to exhibit their 4-H achievements. The camp gave the youthful farmers and home makers an opportunity of becoming better acquainted with the work and facilities of the department, enabled them to learn how the Federal Government operates, and allowed them to discuss 4-H Club matters of mutual interest with delegates from other agricultural regions.

Each year, extension agents in one part of the country or another are called on to meet emergency conditions. This year, valiant emergency aid was given by extension agents in Alabama, Georgia, and Florida to flood sufferers. In Alabama, the extension service cooperated with the American Red Cross in raising approximately \$100,000 and in providing 15 cars of food, clothing, and other supplies for the immediate needs of the refugees. Shipments of fertilizer were arranged through the Alabama Farm Bureau Federation. Home demonstration agents gave dem-

onstrations in refinishing furniture damaged by the flood, and helped to put the homes in a healthful condition. Farmers were aided in resuming their farming operations when the floods subsided and in many ways were helped by the extension agents in rehabilitating their homes.

By special Act of Congress, the Smith-Lever Act was extended to Hawaii and cooperative extension work was begun there on July 1, 1928. The Department of Agriculture lent W. A. Lloyd to act for a year as the first dean of extension and to organize the work on the Island. In the winter of 1928-29, Congress authorized the extension of the Smith-Lever Act to the Territory of Alaska, but no funds had yet been appropriated for this purpose. Porto Rico came into the extension family during the year through the beginning of cooperation with the U. S. Department of Agriculture in the employment of an extension forester. Extension work in Guam and the Virgin Islands was carried on through the Federal experiment stations.

The total funds provided for cooperative extension work from all sources for the fiscal year ending on June 30, 1930, were approximately \$24,258,000, an increase of about \$1,340,000 over the previous year. Approximately \$274,000 of this increase was from Federal sources and \$1,066,000, from State and county funds. Additional funds in the amount of \$500,000 were made available under the provisions of the Capper-Ketchum Act, but this increase was offset to a considerable extent by reduction in the special Federal appropriation for aid in the employment of extension agents in the Mississippi Valley area flooded in 1927. Of the total funds, \$9,250,000, or 38 per cent, was contributed by the Federal Government, \$6,950,000, or 29 per cent, was from State appropriations to the agricultural colleges and other State agencies, and the remaining 33 per cent, or \$8,058,000, came from county appropriations for extension work and from contributions of local organizations and individuals. About 95 per cent of all funds allotted for cooperative extension work during the year came from public sources.

Although most of the increase in extension funds this year came from State and county appropriations, the opposite was true in the previous year when Federal appropriations were increased approximately \$1,500,000 over those of the preceding year. These increases in Federal, State, and county funds since July 1, 1928, permitted material expansion in the extension staff. From July 1, 1928, to Oct. 31, 1929, the extension personnel increased by 659 workers. Of these, 221 were new county home demonstration agents, 28 were assistant home demonstration agents, and 20 were county Negro women workers, an increase of 269 women workers in the counties. The county agricultural agent staff increased by 110, assistant county agricultural agents, by 63, and Negro men agents by 12. One hundred new 4-H Club workers were appointed, 74 of them being county club agents, 20 assistant county club agents, and 6 club supervisors. The number of subject-matter specialists increased by 104. There was no increase in the administrative and supervisory staff. Of the 5820 persons who were engaged in extension work in the United States, 2868 were in county agricultural agent work, 1329 in home demonstration work, 306 in work with boys' and girls' 4-H clubs, and 300 in Negro extension work. There

were 49 State extension directors, one in each of the States and one in Hawaii, and 1108 subject-matter specialists.

Although statistics of extension accomplishments for 1929 were not available at the end of the year, some idea of the volume of work carried on and results obtained may be gained from the figures for 1928. In helping farm people to obtain a larger farm income and to make their home life more comfortable and attractive, extension workers supervised a total of 851,526 result demonstrations in 1928 that were carried on by farmers and farm women as practical and inspiring lessons to their neighbors. This was an increase of about 80,000 over the previous year. Boys' and girls' club members also completed 882,800 demonstrations, or an increase of 103,700. The demonstrations supplemented by the press, bulletins, extension meetings, lectures, and other methods resulted in a total of 4,662,000 instances in which some member of the farm family accepted and put into every-day use the practices taught. Valuable assistance was given to extension workers by 237,817 volunteer local leaders who gave their time and effort in the formulation of extension programmes, training club members, conducting demonstrations, and in other ways helping to make extension efforts more productive.

The enrollment of different boys and girls in 4-H Club work has increased steadily during five years, the increase per year having averaged approximately 41,000 boys and girls. The enrollment in 1928 was 663,940, as compared with 619,712 in 1927. They were organized into 46,670 groups, known as 4-H clubs. Of the total number enrolled in 1928, 67.4 per cent completed all work assigned to them. Some of the results obtained by club members during 1928 were the cultivation of 37,000 acres of corn, 21,500 acres of cotton, 5800 acres of potatoes, 5500 acres of peanuts, 2000 acres of wheat, 1540 acres of soy beans, and 7700 acres of home gardens, 68,500 hogs, 35,000 dairy animals, 24,800 sheep, and 1,473,600 standard-bred fowls were raised, 3,356,000 quarts of fruits, jellies, and vegetables were canned, and 528,700 articles of clothing were made.

Farmers' institutes were conducted in 13 States in 1928. A total of 2545 institutes were held with an attendance of 1,354,000 persons.

The demand in 1929 of the U. S. Department of Agriculture for motion pictures exceeded the supply of films available. The Department had films on about 250 subjects. During the year, 55 new exhibits were completed by the Office of Exhibits, 35 were revised, and 105 renovated. Exhibits were made at 74 fairs and expositions in the United States and at the Ibero-American International Exposition at Seville, Spain.

GREAT BRITAIN England and Wales conducted rural extension teaching through farm schools, local lectures, farmers' institutes, and by means of demonstrations and advisory work carried on by the county agricultural staff. A staff of specialists, known as advisory officers, also was maintained at each of 14 advisory centres. On Apr. 1, 1928, 67 specialist advisory officers were stationed at these centres, covering the subject-matter phases of dairy bacteriology, agricultural economics, entomology, mycology, and veterinary science, all branches of science bearing directly on farm management. Their duties were to visit farmers to give them advice on matters

which the county staff could not handle, give lectures, and reply to letters requesting information. They cooperated closely with the county agricultural staffs and acted as liaison officers between the county staffs and the research workers at the colleges and experiment stations. Women's rural institutes gave training to farm women on all phases of home economics and handicraft and included also studies in English, history, literature, singing, arithmetic, and other practical and cultural branches of learning. Early in 1929 the National Association of Young Farmers' Clubs was founded under the auspices of the National Council of Social Service. Boys' and girls' clubs had been sponsored in 1921 by commercial interests. In 1924 they came under the supervision of the Ministry of Agriculture. At the close of 1928, however, a review of club work revealed that although it had made progress and the movement had become national in scope, certain social features made it desirable to transfer responsibility for young farmers' clubs from the Ministry to a voluntary body. The National Council of Social Service, an organization consisting of rural community councils in many counties, was selected for the purpose and given a grant of money for five years, the amount decreasing annually until the end of this period, when it was hoped the club movement would be self-supporting. Although the National Association of Young Farmers' Clubs came into existence early in 1929, club work at the end of the year was already on a more solid foundation and gave promise of steady and substantial growth.

SCOTLAND A staff of agricultural workers in the counties came under the direction of the agricultural colleges at Aberdeen, Glasgow, and Edinburgh. This staff of county workers was supplemented by a corps of specialists at the colleges, to whom difficult problems were referred.

CANADA Extension activities were carried on through the provincial departments of agriculture by means of agricultural representatives, boys' and girls' clubs, short courses at colleges, women's institutes, lectures, demonstration trials, and similar methods and agencies. In *Novia Scotia*, boys' and girls' club work made outstanding progress in 1928, more communities being reached than ever before. Poultry-club judging competitions and calf-club demonstrations at the Maritime Winter Fair were new features. Garment-making clubs were started for the first time by the women's institutes. An encouraging sign of progress in this province was the increased number of men and women who gave their time and effort to developing extension work. In *Ontario*, women's institute courses proved to be popular among farm women who desired a knowledge of cooking, food values, home nursing and first aid, sewing, and millinery. Lecturers were provided by the Institutes Branch of the Department of Agriculture who gave, in 1928, a total of 277 demonstration-lecture courses which were attended by 7239 women. *Quebec* established demonstration farms managed by the owner under the supervision of the Department of Agriculture. Typical farms were selected in an effort to determine and to teach to other farmers what profit may be expected from following scientific farming methods. In 1927, 25 such farms were being operated with an average labor income of \$1012. In *Manitoba* one of the most popular forms of extension work, was

a series of lectures broadcast over the radio. These radio correspondence courses included lectures, bulletins, quizzes, and special assistance for individual students by means of correspondence. Certificates were supplied to persons completing a course.

UNION OF SOUTH AFRICA Extension work was conducted by the Division of Agricultural Education and Extension of the Department of Agriculture. Extension officers were stationed in various districts throughout the Union, whose principal duties were to give personal advice and instruction to farmers, hold lectures, establish demonstration plots, and direct the extension activities of four schools of agriculture, which are extension centres in their respective areas. During 1927-28, 24 extension officers gave 630 lectures attended by 22,080 persons, visited 3270 farms, and established 82 demonstration plots. Sheep and wool officers and poultry-extension officers visited 4240 farms and gave 940 lectures. Six women, trained in domestic-science subjects, gave 530 lectures and demonstrations to 11,000 farm home makers, on subjects as canning, planning the laundry, child welfare, kitchen arrangement and the like. Club work was begun by the Department of Agriculture in the form of boys' maize-growing competitions. A special officer was employed by the Division of Agricultural Education and Extension to direct all club work in the Union. In 1928 there were 565 maize-growing and 76 tobacco-growing competitions in addition to kaffir-corn clubs and poultry clubs.

INDIA In Madras cooperative agricultural associations have been found to be most effective in introducing quickly improved agricultural practices in a country where farming people constitute more than 70 per cent of the population. In spite of the difficulty of persuading peasants to form agricultural societies and the great amount of departmental supervision necessary when first started, gratifying results have been obtained. In Bengal, Mahila Samitis, or women's associations, have been prominent in bettering the condition of rural women through proper vocational and cultural education and training. Their activities are very numerous and include public-health work, maternity and child-welfare work, instruction in cottage and domestic industries, exhibitions, care of kitchen gardens, women's classes for general instruction, organization of girls' schools, and rural reconstruction work.

SWEDEN Farm advisers and agricultural experts employed by county agricultural societies continued to carry on extension activities among rural people. Competitions formed one of the important features of the work with young boys and girls, the aim being to arouse the interest of young people in the farming profession and to teach them to manage their own enterprises. Courses were given in the care of gardens, pruning trees, slaughtering, cooking, canning, farm bookkeeping, home industries, care of the sick, and other phases of crop growing and livestock raising.

NORWAY Extension work was conducted through the Department of Agriculture, the various agricultural and forestry associations, and, in some instances, the local authorities. The Department of Agriculture employs a staff of 29 extension specialists. The 18 county agricultural societies, subsections of the Society for Norway's Welfare, employ experts who give instruction to

farmers, hold exhibitions of livestock and farm and garden products, and conduct experiments. Other associations which are national in scope also employ specialists to assist farmers. The Norwegian Agricultural Council was formed as an advisory body to strengthen the cooperation between the agricultural societies and the central administration. Some of the local district councils also employed extension workers, whose salaries and expenses are paid partly by the county, partly by the district council, and partly by the State. To reach the farm women, a national committee was formed in 1927 to organize home-economics extension work. The aid of the agricultural societies was sought. The societies agreed to appoint rural home-economics committees, provide teachers and lecturers for courses and demonstrations, furnish needed equipment, and further the cause of home-economics extension among the farm women.

DENMARK The Department of Agriculture, the Royal Agricultural Society, and local farmers' organizations were responsible for carrying on extension activities. Instruction was given to rural women through short courses at colleges and schools, through lectures sponsored by the agricultural societies, and through tours to model farm homes. Young country girls who were unable to attend the regular home management schools were given instruction by advisers employed by rural and domestic-economy societies in cooperation with the General Education Board.

GERMANY Experiment clubs continued to operate as a method of inducing farmers to adopt improved agricultural practices. They originated in Saxony in 1921, where they were first composed of landowners who formed societies to carry on experiments to increase farm production during the difficult years following the close of the World War. In 1929 more than 600 of these experiment clubs flourished in Germany with the greater portion of the membership consisting of farmers managing small and medium-sized farms. The work of experiment clubs was financed mainly from funds provided by the central administration, the district governments, and the chambers of agriculture. Experiments conducted by the clubs were concerned with practices of fertilizing, soil tillage, production of forage crops, market crops, and orchards, livestock raising, farm management, and plant protection.

Rural housewives' societies continued to teach rural women through lectures and courses in home economics and agriculture. Each of the various societies employs a number of specialists in various subjects, such as gardening, poultry keeping, and home management. These specialists give lectures, conduct short courses in baking, food preservation, sewing, fruit growing, poultry keeping, and similar subjects, conduct demonstrations of modern methods and equipment, and give advice and help to individual farm women in their own homes.

AUSTRIA Home-management instruction was extended to the rural women of Lower Austria through courses in domestic science, nutrition, hygiene, darning, poultry keeping, and kitchen gardening. During the four winter months, classes were held three evenings each week. During the remainder of the year itinerant courses were given which lasted six weeks, the entire day being devoted to instruction. Most satisfactory results were obtained from these home-manage-

ment courses. Their number had increased from six in 1924-25, which were attended by 110 pupils, to 70 in 1928-29 with an attendance of 1200 pupils. Measures were taken during the year to hold the courses regularly in every province of Lower Austria.

**HUNGARY** Since the World War, the Government had devoted considerable attention to improving the condition of village people. Special agricultural instruction was given in the village schools, as well as extension teaching carried on outside of the schools. Instructors in schools of agriculture and in normal schools were obliged to be not required for regular school duties to the agricultural training of young people and adults in their school districts. The instructors give lectures, conduct competitions, conduct meetings, and give advice. During 1928, 2060 lectures were given in 252 villages. The radio also has proved to be an effective medium of disseminating agricultural information. The Federation of Hungarian Villages, an association founded in 1920, initiates, organizes, supports, or directs every enterprise for farm and home improvement.

**ITALY** A traveling staff of agricultural teachers continued to instruct the peasant people in proper agricultural practices. A chair of agriculture was maintained in each province with a director in charge and a corps of specialized assistants and part-time agricultural teachers. Practical demonstrations were given. It was estimated that there was an average of one center of agricultural instruction and improvement for every 34,000 hectares (about 84,000 acres) of agricultural and forest land or for every 50,000 inhabitants. As a result of this, progress in agriculture was marked.

Agricultural extension work also was carried on in Argentina, Australia, Belgium, Brazil, British Guiana, China, Cyprus, Czechoslovakia, Ecuador, Finland, France, Jamaica, the Netherlands, New Zealand, Paraguay, Poland, Spain, Switzerland, and Uruguay.

**BIBLIOGRAPHY** Consult *Report of the Director of the Extension Service, 1929*, by C. W. Waiburton (U. S. Department of Agriculture). "History of Agricultural Extension Work, 1785-1923," by A. C. True (U. S. Department of Agriculture), *Miscellaneous Publications, 15*, 1923. "History of Agricultural Education, 1785-1925," by A. C. True (U. S. Department of Agriculture), *Miscellaneous Publications, 63*, 1929).

**AGRICULTURAL LEGISLATION IN THE UNITED STATES** Although the outstanding agricultural question inherited from 1928 was still that of attempting to relieve the agricultural situation by Federal legislation, the outgoing Seventieth Congress confined its efforts in the brief period before its expiration on March 4 almost entirely to noncontroversial matters. The annual act making appropriations for the support of the Federal Department of Agriculture (see **AGRICULTURE, U. S. DEPARTMENT OF**) was duly enacted on February 16, and later supplemented by numerous deficiency appropriations and the provision of \$6,000,000 for Federal loans for seed, feed, and fertilizer to farmers in storm- and flood-stricken areas of Virginia, North Carolina, South Carolina, Georgia, Florida, and Alabama. The funds available to the States, under the Federal Vocational (Smith-Hughes) Act of 1917 were,

under an act approved Feb. 5, 1929, enlarged by an additional grant of \$500,000 for the fiscal year ending June 30, 1930, and for each year thereafter, for four years, by a sum exceeding by \$500,000 the sum appropriated for each preceding year. These sums were to be divided equally between the subjects of agriculture and home economics for the payment of salaries of teachers, supervisors, and directors and the development of home economics subjects in the various States and territories on a basis of their respective farm and rural populations. See also **AGRICULTURAL EDUCATION**.

In addition, by acts approved January 21 and February 23, respectively, a grant of 100,000 acres of vacant nonmineral lands was made for the support and maintenance of the Alaska Agricultural College and School of Mines, and the benefits of the Hatch Act of 1887 and the Smith-Lever Act of 1914, providing, respectively, Federal funds for agricultural experiment stations and for extension work in agriculture and home economics, were extended under certain restrictions to the territory of Alaska. The Federal Farm Loan Act of 1916 was amended to provide branch banking facilities for Porto Rico, with a limit of \$15,000 on individual farm loans.

Shortly after his inauguration, President Hoover convened a special session of the Seventy-first Congress to meet on April 15 for the purpose, as stated in his initial message, of redeeming "two pledges given in the last election—farm relief and limited changes in the tariff." On the opening day of this session, the House committee on agriculture submitted a farm relief measure which was passed by the House of Representatives with amendments, on April 25, by a vote of 367 to 31. Meanwhile, the Senate committee had reported a bill, which also contained a provision for the issuing of debentures on exports of raw agricultural commodities or their food products. On May 8, the Senate voted 47 to 44 for the retention of this provision, and on May 14 passed the bill itself 54 to 33. Eventually, however, after the rejection of the debenture provision by the House on June 13, by a vote of 250 to 113, the Senate agreed to its omission and the bill was signed by President Hoover on June 15.

The new measure, known as the Agricultural Marketing Act, declared it to be the policy of Congress "to promote the effective merchandizing of agricultural commodities in interstate and foreign commerce, so that the industry of agriculture will be placed on a basis of economic equality with other industries." To that end the act was designed to protect, control, and stabilize the currents of this commerce by minimizing speculation, by preventing inefficient and wasteful methods of distribution, by encouraging producer-owned and controlled cooperative organizations for greater unity of effort in marketing, and by aiding in preventing and controlling surpluses in any agricultural commodity through orderly production and marketing.

As the executive agency to administer the act, there was created the Federal Farm Board, consisting of the Secretary of Agriculture *ex officio* and eight members selected by the President with "due consideration to having the major agricultural commodities produced in the United States fairly represented on the board." Provision also was made for the selection by the various cooperative associations handling each commod-

ity of an advisory committee for that commodity.

In addition to an administrative fund of \$1,500,000 for the use of the board and its commodity committees for the period ending June 30, 1930, there was appropriated a revolving fund of \$500,000,000. This revolving fund was intended to be drawn upon as needed for loans to coöperative associations and stabilization corporations and for the furnishing of insurance to the coöperative associations against loss through a decline in prices.

Loans to coöperatives were authorized to assist in the effective merchandizing of agricultural commodities and their food products, the construction or acquisition of physical marketing facilities, the formation of clearing-house associations to foster economic distribution and minimize waste and loss, the enabling of the coöperative associations to advance to their members a greater share of the market price of the commodity than is practicable under other credit facilities, and the extending of the membership of the associations by a campaign of education. In a similar way, the stabilization corporations which may be organized for the preparing, handling, storing, processing, and merchandizing of specific commodities may be granted loans to provide working capital or attempting a control of a surplus under prescribed conditions. Neither loans nor insurance are authorized to be supplied, however, if in the judgment of the board the result would be to increase unduly the production of a commodity in which a surplus is commonly produced in excess of the annual marketing requirements.

In order that it may operate with a background of adequate and accurate information, the board also is given broad powers along the lines of education, research, and extension. In this work, it is directed to avail itself of the services and facilities of any establishment in the executive branch of the Government, and is authorized to coöperate with any State or Territory or any department, agency, or political subdivision thereof or with any person. Progress under the act is discussed elsewhere. See AGRICULTURE.

Efforts to restrict the tariff bill, passed by the House of Representatives on May 28 and pending in the Senate at the close of the year, mainly to the agricultural schedules proved unsuccessful, and the measure took the form of a general revision, as discussed elsewhere. See under UNITED STATES.

**AGRICULTURE.** Agriculture occupied a very important position in the public affairs of the United States during 1929. There was evidence of better basic conditions, although much further improvement was held necessary before the situation could be deemed satisfactory. President Hoover called a special session of Congress to meet April 15, asking that it confine itself to passing legislation for the relief of agriculture and revising the tariff, especially for the benefit of farming and industries which had not been prosperous. Deliberations in farm relief culminated in the passage of the Agricultural Marketing Act, approved June 15. This measure was essentially intended to enable agriculture to effect a better adjustment of production to demand and a more efficient system of marketing. Although opinion was sharply divided during the preparation of the law, its enactment was hailed with general approval and satisfaction. Consideration of the tariff measure which revised

most of the schedules and generally increased duties was continued into the regular session of Congress. Preferential interest rates for agriculture and large scale farms, both significant of the new trend of industrialization of agriculture, also were considered by Federal government agencies engaged in planning a programme of farm relief.

The position of agriculture in general at the close of the crop season of 1928-29 was better than at the close of the preceding year, and there were prospects of continued improvement. The crop season 1929-30 began with a rising farm-commodity price level, and with only moderate supplies of the principal products in prospect.

Agriculture closed the calendar year 1929 with no depressing surpluses of food products to be worked off before the planting of the 1930 crops, according to the U. S. Department of Agriculture. Crops of 1929 showed an increased valuation of about \$85,000,000 over 1928, due mainly to the increased value of potatoes, and livestock sales showed an increase of about \$90,000,000, practically all of which was in hogs. The most striking increase in crop values was in potatoes, in that a crop nearly one-fourth smaller than in 1928 was valued at \$470,000,000, about double the value of the 1928 production.

Packers during the first ten months of the year paid \$936,000,000 for hogs slaughtered under Federal inspection, an increase of \$86,000,000 over the corresponding period in 1928. Cattle slaughtered under Federal inspection in the first 10 months of 1929 brought \$716,000,000 as compared with \$718,000,000 the preceding year, and sheep and lambs brought \$131,000,000, as compared with \$126,000,000 in 1928.

FEDERAL FARM BOARD. The Agricultural Marketing Act, approved June 15, 1929, declared the policy of Congress to be to promote effective merchandizing of agricultural commodities in interstate and foreign commerce, so that agriculture will be placed on a basis of economic equality with other industries. To that end, the act is designed to protect, control, and stabilize the currents of such commerce by minimizing speculation, by preventing inefficient and wasteful methods of distribution, by encouraging producer-owned and -controlled coöperative organizations for greater unity of effort in marketing, and by aiding in preventing and controlling surpluses in any agricultural commodity through orderly production and distribution.

The Federal Farm Board created by the act included in its initial membership Chairman, Alexander Legge of Illinois; James C. Stone of Kentucky, representing tobacco; Carl Williams of Oklahoma, cotton; C. B. Denman of Missouri, livestock; Charles C. Teague of California, fruits and vegetables; William F. Schilling of Minnesota, dairying; Charles S. Wilson of New York, general farming; and Samuel R. McKelvie of Nebraska, wheat, all members selected by the President; and the Secretary of Agriculture, member *ex-officio*.

The board was entrusted with important and varied functions in regard to production and marketing as a means of advancing general welfare. It was authorized to avail itself of the services and facilities of any executive governmental establishment and coöperation with State and Territorial agencies also was permitted. The agricultural colleges, experiment stations, extension services, and State agricul-

tural department officials all pledged their full cooperation in the enterprises of the board.

The board decided that the most useful and safest initial operation would be to further activities of established cooperative marketing agencies, feeling that such action would so simplify many problems that their solutions would be comparatively easy. Its aim was to encourage the eventual development of large-scale cooperative organizations which would be a stabilizing factor in marketing but not supplant local cooperatives. It considered its work as involving a long-time constructive programme rather than simply one dealing with emergencies. At the outset the board granted hearings to representatives of cooperative associations from every section of the country. The more than 50 groups heard were concerned with citrus fruits, cotton, raisins and grapes, terminal grain commission agencies, wheat pools, grain elevators, wool, rice, beans, fruit, and vegetables.

A revolving fund of \$500,000,000 authorized by Congress was intended to be drawn upon as needed for loans to cooperative associations and stabilization corporations and for the furnishing of insurance to cooperative associations against loss through a decline in prices. To obtain a loan from this revolving fund, the organization applying must be a cooperative organized under the provisions of the Capper-Volstead Act, handling an agricultural product and doing an interstate business. The money is loaned to the cooperatives at a limited rate of interest—"in no case shall the rate exceed 4 per cent per annum on the unpaid principal," according to the act.

The announced future policy of the board will be to loan money from the revolving fund to the national commodity marketing organizations as soon as they have been established. In the absence of these central associations or corporations, the board has advanced money to qualified cooperatives direct. Up to Jan. 14, 1930, the board's commitments to farmers' cooperatives had totaled \$58,690,000, to be used by cooperatives in building facilities for the handling of farm products and for advancements to farmers on their crops. In most cases, the commodity loans have been supplemental to loans made by the Federal intermediate credit banks. Commodity commitments have been made on grain, cotton, fruits, livestock, wool and mohair, dairy products, rice, beans, honey, and seeds.

The Farmers National Grain Corporation, incorporated in October, 1929, was the first national commodity cooperative sales association to be set up under the guidance of the board. Central marketing agencies also were established for cotton, wool, and mohair and definite steps were taken to organize a central or national agency for livestock.

**THE AGRICULTURAL SITUATION** Agricultural conditions in the United States continued gradually to improve. Farm incomes in the crop season 1928-29 averaged higher than those of any season since 1920-21 except 1925-26. The movement of population from the country to the town declined, and the rate of depreciation in farmland values did likewise. The aggregate gross income from agricultural production in the United States for the crop season 1928-29 was estimated at \$12,527,000,000, or about \$225,000,000 more than in the preceding year. The cash income from the sale of farm products was estimated to have totaled \$9,949,000,000, or an increase of \$79,000,-

000 over 1927-28. The net income of the farmers did not increase proportionately, because farm operating costs, taxes, and interest on debts advanced somewhat. The income available for living on the farm, including the value of farm products used by farm families, was only about \$10,000,000 greater than in the previous season. The return earned on the current valuation of agricultural property was about the same, namely, 4.7 per cent, compared with 3.1 in 1922-23 and 1.4 in 1921-22.

Farm taxation continued to be a problem of major importance. Taxes on farm property still rose slightly during the year, the increase for the United States as a whole approximating 1½ per cent. As a measure of the tax burden on all farm properties, research results covering 14 States indicated that during five years taxes had taken about one-third of the net rent on rented farms. Estimates were that in 1928 farmers paid \$1.42 in taxes on each \$100 of actual value of their real estate. Since public expenditures tend normally to increase, reduction in farm taxes is not usually to be sought through general reductions in public expenditure, but rather through readjustments tending to equalize tax burdens among all taxpaying groups. Broadening the assessment basis of the general property tax, improved methods of collection, and increased reliance on revenues from intangibles have been suggested to relieve the burden on farm property.

Farm real estate values were appreciably nearer stability during 1928 and 1929 than at any time since the downward movement began. A survey by the Department of Agriculture for the year ended Mar. 1, 1929, showed that for the country as a whole farm-land values declined by 1 per cent, the smallest loss in any year since the post-war depression began, and nominal compared with the declines of 1921, 1922, 1923, and 1924. For the country as a whole, more than three-fourths of the war-time gain over pre-war levels had been canceled. In the 12 months indicated, the rate of forced sales and related defaults approximated 19 farms per 1000 farms, as compared with 22.8 farms per 1000 in the preceding year. Much improvement was deemed necessary to restore normal conditions, the foreclosure rate being still very high, and the farm bankruptcy rate being seven times the pre-war figure. On the other hand, the transfer of farms by voluntary purchase or sale was far below normal. The total farm-mortgage debt for the United States on Jan. 1, 1928, was estimated to be \$9,468,528,000; on Jan. 1, 1925, \$9,360,620,000, and on Jan. 1, 1920, \$7,857,000,000.

Prices received in August, 1929, by farmers for their principal products averaged 143 per cent of the pre-war level, compared to 139 per cent in August, 1928. The price level of commodities usually bought by farmers remained at about 156 per cent of the pre-war level. Compared with the corresponding figures for 1921-22, 119 per cent and over 150 per cent, respectively, the exchange value, or the purchasing power of farm commodities, improved. In reporting the foregoing, the Department of Agriculture observed that only when the farmer's net income increases more than the prices of things he must buy does he obtain an increase in purchasing power. In recent years, a substantial gain of this character actually had taken place. However, in the crop year 1928-29, more improvement occurred in the gross farm income and in the price

situation than in the net income of the farmers, because of increased costs, including higher taxes.

Farm credit remained costly in many parts of the United States notwithstanding the great improvement made in agricultural credit facilities during the last 10 or 15 years. Favorable changes of fundamental importance were brought about by the Federal Reserve Act of 1913, the Farm Loan Act of 1916, and the Intermediate Credit Act of 1923. It was felt that further progress might be expected from the financial provisions of the Agricultural Marketing Act of 1929. It was pointed out that in the improvement of agricultural credit, there is a broad field for action by the several States.

Tariff protection for the farmer has been more generally recognized in recent years as a necessary part of a sound policy. President Hoover in his message of December 3, stated

An effective tariff upon agricultural products, that will compensate the farmer's higher costs and higher standards of living, has a dual purpose. Such a tariff not only protects the farmer in our domestic market but it also stimulates him to diversify his crops and to grow products that he could not otherwise produce, and thus lessens his dependence upon exports to foreign markets. The great expansion of production abroad under the conditions I have mentioned renders foreign competition in our export markets increasingly serious. It seems but natural, therefore, that the American farmer, having been greatly handicapped in his foreign market by such competition from the younger expanding countries, should ask that foreign access to our domestic market should be regulated by taking into account the differences in our costs of production.

In his annual report to the President, Secretary of Agriculture Arthur M. Hyde observed

Hence the consideration by Congress of a tariff bill providing substantial increases on the duties of many agricultural products is a happy augury. This Nation is committed to the protective principle. The tariff legislation in prospect, coupled with the trend in our foreign trade, promises to make that principle more effective for agriculture.

He further pointed out that the tariff conspicuously assists producers of flax, sugar, beef cattle, sheep, wool, and dairy products, and that tariff protection can be effective on vegetable fats and oils, corn, and wheat.

The drift of population from the country to cities has continued, according to a survey by the Department of Agriculture, which shows that the farm population at the end of 1928 was the smallest in more than 20 years. Although the gross movement of persons from the farms was somewhat smaller in 1928 than in 1927 and 1926, it comprised the total of 1,960,000 persons. This was largely offset, however, by the movement of 1,362,000 persons from cities, leaving a net movement of 598,000 persons from the farms to the cities. Farm population, as of Jan. 1, 1929, was estimated at 27,511,000, compared with the census estimate of 32,076,900 for Jan. 1, 1910.

**CROP PRODUCTION IN 1929.** The area of crops harvested in 1929 was estimated to be 367,082,000 acres, an increase of more than 1 per cent over the acreage harvested in 1928. Hay made up a large part of the increase. However, crop yields were reduced by widespread drought, averaging 53 per cent less than those of 1928 and 2.2 per cent below the average during the preceding decade. The losses in production, however, were so evenly distributed for the country as a whole that no large area had either very bounti-

ful or very short crops. As a result of the lower yields, the production of principal crops was 4.8 per cent less than in 1928. For farmers, however, the reduced production appeared to have been so offset by higher prices that the increase in total value was nearly proportional to the increase in acreage harvested. The chief increases in valuation were shown by hay, fruits, vegetable and sugar crops, and the more important decreases by grains and cotton. The total farm value of the 50 principal crops in 1929 was estimated at \$8,580,731,000, an increase of about 1 per cent over the valuation in 1928.

The wheat crop, estimated at 806,508,000 bushels, or over 100,000,000 bushels less than the 1928 crop, slightly exceeded the average during the preceding five years. The greatest decline was in spring wheat, which produced only 228,172,000 bushels, as compared with 336,203,000 bushels in 1928. More than half the hard winter wheat, one-fifth of the hard spring wheat, and a smaller proportion of the soft winter wheat in the United States were harvested by combines. The world wheat crop in countries outside the U. S. S. R. (Russia) and China was estimated at 3,400,000,000 bushels, against 3,930,000,000 bushels in 1928. Canada produced 293,899,000 bushels, not much more than half the 1928 crop. Production in 24 European countries was reported to be slightly larger than in 1928. Indications were that the crops of Argentina and Australia would probably be less than 300,000,000 bushels, as compared with 500,000,000 bushels in 1928 and a five-year average of about 380,000,000 bushels. As the carry-over was larger than the previous crop year, the total world supply for 1929-30 was only about 360,000,000 bushels less than the supply available in 1928-29.

The production of corn for all purposes in 1929 equalled 2,622,000,000 bushels, or 7 per cent less than the 1928 crop and 4.6 per cent less than the average production of the five years 1923-27. The acreage, 98,018,000, was 2.6 per cent less than in the previous year and the acre yield averaged, 26.8 bushels, compared with 28 bushels in 1928. The crop was somewhat larger in the Southern and Western States than in 1928, but was smaller in the North Atlantic States and in the Corn Belt proper. Production of corn for grain was estimated at 2,191,135,000 bushels, for silage 29,908,000 tons, and for hogging, grazing, and forage, 11,113,000 acres. Increased production was reported from abroad, nine European countries reporting a total of 651,973,000 bushels, compared with 346,534,000 in 1928.

The oats crop, estimated at 1,238,654,000 bushels, was about 200,000,000 bushels below 1928. The decrease was due in part to smaller acre yields and partly to a decrease of more than 1½ million acres. Foreign countries reported oats totaling 2,109,586,000 bushels, compared with 2,168,780,000 in 1928. Barley production was below the record of the previous year, the estimate being 307,105,000 bushels for 1929 and 357,467,000 in 1928. The barley crop in foreign countries was reported to be 1,082,380,000 bushels, or about 25 million more than in 1928. About 738,000,000 bushels were produced in Europe, about 11 per cent more than in 1928.

The rye crop declined to 40,629,000 bushels in 1929, compared to 43,306,000 bushels in 1928 and 54,793,000 during the preceding five years, due largely to decline in acreage. In 24 European countries, the rye production was estimated at

884,259,000 bushels Buckwheat produced 11,500,000 bushels which was 1,600,000 below the previous year Rice made 40,217,000 bushels, about three million less than in 1928, but with higher yields on fewer acres Seed flax, grown on increased acreage in 1929, made 16,838,000 bushels or about 3 million bushels less than in the previous year Grain sorghums made redneck acre yields on smaller acreage, totaling 100,845,000 bushels, nearly 42,000,000 less than the crop in 1928

The total hay crop was estimated at 114,639,000 tons, nearly 8 per cent more than in 1928 and the preceding five years Nearly 102,000,000 tons was tame hay, featured by the phenomenal recovery of clover hay production from the small 1928 crop, a smaller recovery of mixed clover and timothy, a sharp reduction in timothy, by a further reduction of alfalfa acreage in Nebraska, Kansas, and California, more than offset by increases elsewhere, and a continued expansion of sweet-clover hay There also was an increased acreage cut of wild and prairie hay

Potato production was estimated at 377,451,000 bushels, about 23 per cent below the 1928 crop The decrease resulted from both a reduction in acreage and a lower acre yield The farm valuation on Dec 1, 1929, nearly \$470,000,000, exceeded that of 1928 by more than \$218,000,000 Production of tobacco in 1929 approximated 1,500,891,000 pounds A moderate expansion in acreage and a higher average yield per acre, especially in the bright flue-cured, burley, dark-fired and dark air-cured districts, accounted for the 9 per cent increase over 1928 Prices averaged 19 cents a pound, compared with 20 2 cents in 1928 Exports of flue-cured tobacco, now constituting nearly three-fourths of the leaf tobacco exported from the United States, were largely taken by the United Kingdom and China

The cotton crop, according to December 1 estimates, was 14,919,000 bales, as compared to 14,478,000 bales ginned in 1928 This output was grown on 45,981,000 acres, an area only slightly below the record of 1926, and 640,000 acres more than 1928 While yields were about average in the eastern part of the Cotton Belt, the dry summer helping to control boll weevil, drought greatly curtailed production in Oklahoma and in much of Texas The 1928 crop suffered from disastrous storms in the Atlantic Coast States yet nearly 14,480,000 bales were harvested from the increased acreage Cotton exports during the fiscal year 1929 exceeded those of the preceding year by about 7 per cent, greater quantities going from the United States to Great Britain, Japan, and Italy, and decreased exports to Germany, France, and U S S R (Russia)

**FARM MACHINERY** The substitution of mechanical power for human and animal labor continued during the year, especially in the Western grain-growing areas The rapid development and adoption of improved farm machinery, particularly the all-purpose tractor and the new cultivating and harvesting equipment associated therewith, has tended toward reduction of farm labor forces required, toward enlargement of the size of farm, toward still further reducing the number of horses and mules, and toward releasing for other purposes still further acreages of crop and pasture land formerly required for their feed.

Improved mechanical methods now in use in

cotton production and others being developed, together with further expansion of producing areas, have threatened a problem for cotton growers on rougher lands less well adapted to machinery More than twice as many tractors were turned out in 1928 as the 62,742 manufactured in 1927, which in turn doubled the production of 1916 The post-war rise of the combine (combined harvester-thresher) has been extremely rapid, increasing in Kansas alone from 8274 in 1926 to 20,000 in 1928 In many localities, farmers have increased the size of their implements and the area of land tilled by using larger teams Such increases in the size of power units of farm equipment have been held the chief cause of the recently accelerated trend toward increase in farm size, especially in the Plains and Mountain States of the West

**MEDITERRANEAN FRUIT FLY** Early in April, the Mediterranean fruit fly, one of the worst fruit pests known, was found to be well established in central Florida Appreciation of the far-reaching economic significance of this discovery was immediate and nation-wide and resulted in a general demand that the eradication of the insect should be undertaken at whatever cost Stringent State and Federal quarantines and restrictions on the movements of all host fruits and vegetables, together with vigorous control measures, were undertaken at once The clean-up and spraying work carried out so far in Florida strengthened the possibility of eradicating the fly Fly abundance and fruit infestation have been diminished rapidly and new records of finding infested fruit and flies have been very few See ENTOMOLOGY, ECONOMIC

**AGRICULTURAL COOPERATION** The important functions assigned to cooperative associations in the programme of the Federal Farm Board greatly stimulated the American cooperative movement Good progress was made in cooperative marketing in 1929 in general efficiency as well as in membership and in business transacted Increased attention was paid to the development of large-scale organizations, to the centralization of sales, and to the possibilities of regional federation In recent years, membership in cooperative associations and then volume of business have increased more rapidly than the number of associations This tendency lessens selling competition and facilitates efficient distribution and is in line with the desire of the Federal Farm Board that cooperative development shall be effected primarily through a strengthening and closer integration of existing associations

The movement, as seen by the Department of Agriculture, is still largely composed of unrelated units that inevitably conflict to a certain extent More than 90 per cent of the associations now functioning are independent local or regional bodies having little contact with other cooperatives Efforts toward coordinated production and marketing in one region often tend to be nullified by unregulated production and haphazard marketing elsewhere Centralized organizations for coordinated marketing are indispensable if full advantage is to be taken of the agricultural marketing act It is expected that rapid progress will be made in the coordination of cooperative marketing under the act, inasmuch as greater unity of effort among producers' organizations is a leading object

Indicative of the status of the American cooperative movement was the fact that more than

\* The production given for countries of the Southern Hemisphere is for the crop years 1928-29 and 1927-28

200 farmer-owned associations each transacted an annual business exceeding \$1,000,000. A further example of cooperative activity, the 215,000 fruit and vegetable growers, making up the membership of the 1270 cooperatives in the United States marketing fruits and vegetables, sent more than 200,000 cars of produce to the consuming centers in the 1928-29 marketing season. Nearly 48 per cent of the cooperative shipments were oranges, lemons, and grapefruit, about 15 per cent were potatoes, about 6 per cent, apples, and nearly 6 per cent, grapes.

Collective purchasing by farmers' cooperative business associations continued to increase. More than 20 of the large associations, independent or affiliated with farm organizations, did business amounting to about \$60,000,000 in 1927, and close to \$100,000,000 in 1928, and indications were that the 1929 figures would greatly exceed those for 1928.

The American Institute of Cooperation held its fifth summer session at Baton Rouge, La., in late July and early August. The meetings were featured by addresses by the Secretary of Agriculture on the Government's policy toward the cooperative movement and also by other members of the Federal Farm Board. The organization of a national cooperative council was undertaken by representatives of leading cooperatives in the country, with the aim to give the farmer a concerted voice in matters dealing with American agriculture. See COOPERATION.

**WORLD AGRICULTURE.** *Great Britain.* Depression in agriculture continued, conditions being especially severe in East Anglia, and prices in general were becoming unremunerative. The inclination of farmers to put cultivated lands into grass has resulted in reduced employment for farm laborers, who, however, have resisted attempts to cut down their wages. Benefits of unemployment insurance have not extended to farm workers. The greatest possibilities for relief appeared to lie in better marketing, held by many to be the branch of agriculture in which the greatest progress is being made. Activities of the British Empire Marketing Board are reviewed under AGRICULTURAL MARKETING STATIONS.

*Italy.* The Fascist government has promoted agricultural development by a coordinated series of technical, educational, fiscal, and financial measures. The agrarian policy directed toward enlightenment of the rural masses and the acquisition of newly reclaimed land by small landowners has resulted in intensified production, especially of foodstuffs. The wheat campaign started in 1926 showed satisfactory results. The official returns placed the wheat crop of the 1929 season at over 7,000,000 metric tons (about 267,180,000 bushels), the largest so far recorded in Italy, compared with 6,200,000 metric tons in 1928 and with an average for the period 1909-1914 of about 5,000,000 tons. This increase was of economic importance in that it was essentially due to a larger yield, without displacing other major crops, whose output also has substantially increased. Land reclamation work under way was expected to bring some 5,000,000 acres of new land under cultivation.

*Danube Basin.* Recent expansion of corn acreage in the south Danube states and the increased shipments of hogs, pork, pork products, and lard up the Danube, together with the projected construction of packing plants in Bulgaria, with a direct line of steamships to western Europe, as

reported in a survey by the Department of Agriculture, centered attention on the potential importance of the south Danube corn belt as a hog-producing region and as a competitor to the hog industry of the United States. Production of wheat and wheat flour in southeastern Europe was badly crippled by the World War and the disastrous economic situation thereafter, by the breaking up of the Austro-Hungarian Empire, and by sweeping land reforms in which millions of acres formerly operated as large estates passed into the hands of peasant farmers. The former wheat surplus of the south Danube states, which during 1909-13 averaged more than 110,000,000 bushels, was reduced greatly during the five years ended 1925-26, in which period American wheat penetrated to the mountainous interior of Rumania. Now, both American wheat and flour are being forced back toward north central Europe, for wheat production and the milling industry in the Danube Basin have been recovering.

*U S S R (Russia).* Vast areas of fallow lands were placed under cultivation in 1929 by State organizations operating with modern machinery and large farms were collectively organized and operated by peasants pooling their lands. Such organizations accounted for a substantial part of the grain crop in 1929, the total area under such culture amounting to 18,360,000 acres, compared with 7,590,000 in 1928. Further expansion of these types of farming was proposed.

*China.* A food famine causing widespread suffering and death gripped the interior provinces of China, especially Shensi. One-half of the wheat crop in the spring of 1928 and practically all of the crop in the fall of 1928 and spring of 1929 were complete failures due to drought, the basic cause of the famine conditions. However, impoverishment by continuous civil warfare was a contributing cause. In Kansu Province, the famine, supplemented by banditry and civil disturbances, was of longer duration than in Shensi Province, but rains in midsummer were very helpful and the outlook was materially improved, according to the International Famine Relief Commission in Peking.

Statistics showing the crops of various countries so far as available are given in the table on page 26.

**INTERNATIONAL AGRICULTURAL CONGRESS.** The Fourteenth International Agricultural Congress was held at Bucharest, Rumania, on June 7, 8, and 10, 1929. The Rumanian Government invited all countries to participate in the Congress, which is held biennially under the auspices of the International Agricultural Commission. The subjects dealt with included agricultural economics, cooperation and marketing, horticulture, stock raising, and wool production, the sugar-beet industry, and fresh-water fisheries. One section was devoted solely to the position of women in rural life and the measures that should be taken for improvement.

**AGRICULTURE, UNITED STATES DEPARTMENT OF.** On March 6, Arthur Mestrick Hyde of Missouri, a former Governor of that State, succeeded Dr. William Marion Jardine as Secretary of Agriculture and Renick W. Dunlap was continued in the position of Assistant Secretary under the incoming administration. During the year, Elton L. Marshall succeeded R. W. Williams as Solicitor of the department and M. S. Eisenhower followed Nelson Antrim Crawford as Di-

rector of Information, Lee A. Strong, Assistant Director of Agriculture of the State of California was made Chief of the Plant Quarantine and Control Administration heretofore under the direction of Dr. C. L. Marlatt, Chief of the Bureau of Entomology. On April 23 occurred the death of Dr. A. C. True, formerly director of the Office of Experiment Stations and of the States Relations Service and later Specialist in Agricultural Instruction, and on November 11, the death of Dr. E. W. Allen, Chief of the Office of Experiment Stations since 1915.

The report of the Secretary of Agriculture for 1929 reviewed the agricultural situation and dealt largely with production in its relation to agricultural conditions, trends toward greater farm efficiency by the use of improved implements and power machinery, the consequent increase in the size of farms, land values, farm taxation, farm credits, and methods of marketing. In addition the report described the activities of the Department in research, the control of the more threatening insect pests, and in regulatory and other lines.

**AGRICULTURAL RELIEF** An outstanding event of the year was the passage of the agricultural marketing act to improve the economic condition of agriculture by enabling the farmer to effect a better adjustment between production and demand and to set up a more efficient system of marketing his products. For the execution of its provisions, the act established the Federal Farm Board of which the Secretary of Agriculture is *ex-officio* a member and which is given broad powers and extensive resources. The Secretary pointed out that while the legislation stresses effective organization of cooperative marketing associations, it contemplates consideration of all major economic factors materially influencing farm incomes. The Federal Farm Board, he further explained, is not intended to supersede the Department of Agriculture or other existing agencies, nor are its duties to overlap those of established branches of government work, but that the activities of this new agency are to be coordinated with those of departments and bureaus already functioning. The necessity of close cooperation between the Board and the Department and the opportunity for cooperation with the Board of different public and independent forms of service was set forth. To facilitate the work of the Federal Farm Board, the Division of Cooperative Marketing in the Bureau of Agricultural Economics of the Department of Agriculture was transferred to the Board under presidential order.

**FARM BY-PRODUCTS** The Department gave increased attention to the utilization of agricultural by-products and the elimination of farm wastes and considered these matters as a part of the problem of farm relief. The principal by-products and wastes receiving attention were cornstalks, corn cobs, cereal straw, oat hulls, cotton stalks, cottonseed hulls, flax straw, peanut shells, and bagasse. These wastes constitute over 60 per cent of the gross tonnage produced from the soil in the crops represented. In studying the industrial uses of these by-products, consideration was given to the farm value of the raw material and whether under the conditions the value of these substances may be increased sufficiently to make their handling and processing profitable.

**SOIL EROSION** The report discussed the problem of soil erosion and described the plans for attacking it under the initial support of \$160,000 ap-

propriated by Congress. The loss of soil fertility and soil material through runoff, the pollution and silting of streams, reservoirs, and irrigation ditches, and the destruction of lands by overwash were mentioned as the principal aspects of the problem. The relation of soil erosion to flood control and the significance of reforestation in this connection were dealt with and the necessity of studying soil types and the various forms of land cover as affecting runoff, soil washing, and stream flow was pointed out.

**ROADS** In the fiscal year ended June 30, 1929, Federal assistance was extended to the construction of 7402 miles of initially improved roads which brought the total mileage of roads thus improved since the inception of the Federal policy up to 79,796 miles, including 28,991 miles of gravel roads, 20,618 miles of cement concrete roads, and 11,667 miles of graded and diamed earth roads, also 267 miles of bridges. Secondary improvements were completed during the year on 1988 miles of road. The total cost of the initial and secondary improvements for the year amounted to \$195,298,168 of which \$82,730,678 was contributed by the Federal Government. As for several years past the appropriations for road construction in the National Forests were limited to \$7,500,000, of which \$3,000,000 was used for building roads and trails within the forests and the remainder for main highways through the forest areas linking them with Federal-aid and State-highway systems. Danger and direction signs of standard design for all routes of the United States highway system were adopted during the year.

**EXPENDITURES** The total expenditure of the Department during the fiscal year 1929 amounted to \$172,898,690. This was divided among the six general classifications of the Department's work as follows: Research, \$17,809,275; extension, \$9,890,499; eradication or control, \$12,267,299; service activities, \$25,137,116; regulatory work, \$10,954,570; and road construction, \$96,839,981.

**APPROPRIATIONS** The Department of Agriculture appropriations for the fiscal year 1930, which began July 1, 1929, amounted to \$157,455,030. This amount included \$82,000,000 for Federal-aid and forest road construction and approximately \$12,000,000 for payments to the States for the agricultural experiment stations and for extension work. In continuation of the policy of expanding and strengthening scientific research, the appropriation act as compared with the preceding year provided an increase of \$1,500,000 for research in the Department and \$495,000 for such work in the experiment stations of the States and Hawaii.

The new administration building of the Department which connects the two wings built in 1907-08 was nearing completion at the close of the calendar year 1929.

**ATKINS, THE HON. SIR JAMES (ALBERT MANNING)** Canadian lawyer and public official, died in Winnipeg, Manitoba, Mar. 1, 1929. Born in the County of Peel, Upper Canada, Dec. 10, 1851, he attended Upper Canada College, and the University of Toronto. Called to the bar of Ontario in 1878, he moved to the newly settled Province of Manitoba the following year and commenced practice at Winnipeg. He became solicitor for the Canadian Pacific Railway Company in 1881, and remained with that company until 1911. He was made Queen's counsel in 1884, and, in addition to his work with the Canadian Pacific, he main-

tained a private law practice. Sir James was elected a Conservative member of Parliament in 1911, from the Brandon constituency of Manitoba. Resigning in 1915, he became a leader in local politics and served as Lieutenant-Governor of Manitoba from 1916 until his retirement in 1926.

One of the founders of the Canadian Bar association, he also was its president, 1914-27, and continuing an active interest in the organization, was honorary life president from that time until his death. Sir James was president of the Conference of Commissioners on the Uniformity of Laws, 1918-23, and honorary president at the time of his death. He also had been honorary bursar and member of the council at the University of Manitoba, 1887-1916, and was honorary lieutenant-colonel of the 90th Regiment of Winnipeg Rifles, and honorary colonel of the 99th Regiment of Manitoba Rangers. The honorary LL.D. degree was conferred on him by the University of Manitoba, 1919, the University of Alberta, 1921, and by McMaster University, the University of Toronto, and Queen's University.

**AIRCRAFT CARRIERS.** See **VESSELS**.

#### NAVAL

**AIRSHIPS.** See **AERONAUTICS**, **NAVAL PROGRAMS**.

**AKRON,** THE UNIVERSITY OF A coeducational institution of higher learning in Akron, Ohio, founded in 1872 as Buchtel College and taken over by the city and renamed in 1914. The enrollment for the summer session of 1929 was 543 students and for the autumn day session, 1170 students, distributed as follows: College of liberal arts, 469; home economics school, 12; teachers' college, 305; college of engineering and commerce, 384; 1761 students were enrolled in the autumn evening session. There were 90 faculty members. The amount of endowment was \$70,000 and the income for the year, including tax levy from the city, \$494,632. There were approximately 30,000 volumes in the library. President, George Frederick Zook, Ph.D.

**ALABAMA.** **POPULATION.** According to the Fourteenth Census, the population of the State on Jan. 1, 1920, was 2,348,174. The estimated population on July 1, 1928, was 2,573,000. The capital is Montgomery.

**AGRICULTURE.** The following table gives the acreage, production, and value of the principal crops in 1928 and 1929.

Crop	Year	Acreage	Prod Bu	Value
Cotton	1929	3,589,000	1,090,000 *	\$107,468,000
	1928	3,534,000	1,109,000 *	100,919,000
Corn	1929	2,876,000	37,464,000	36,715,000
	1928	2,650,000	30,475,000	33,522,000
Hay	1929	608,000	467,000 *	7,531,000
	1928	612,000	473,000 *	7,451,000
Sweet potatoes	1929	74,000	7,622,000	6,860,000
	1928	70,000	6,510,000	5,859,000
Peanuts	1929	408,000	224,400,000 *	6,732,000
	1928	402,000	225,120,000 *	8,780,000
Potatoes	1929	28,000	2,408,000	3,492,000
	1928	36,000	2,812,000	2,390,000
Oats	1929	119,000	2,320,000	1,763,000
	1928	70,000	1,225,000	919,000

\* Bales    \* Tons    \* Pounds

**MINERAL PRODUCTION.** The yield of the coal mines of the State suffered a further reduction in 1928. The quantity of coal mined fell for that year to 17,821,302 short tons, from 19,765,806 tons for 1927. The product of 1928 had a value of \$30,601,000; that of 1927, a value of \$44,524,000. The production of coke, on the other

hand, virtually held its own. The by-product coke ovens produced in 1928, 4,327,324 short tons of coke, in value \$13,280,178, as against 4,364,354 tons, in value \$13,500,234, produced in 1927. The quantity of iron ore mined fell to 6,159,863 long tons for 1928, from 6,508,419 tons for 1927, the value of the iron ore mined declined to \$11,599,176 for 1928, from \$12,973,597 for 1927. The production of pig iron was on a reduced scale, the blast furnaces produced 2,525,812 long tons, in value \$42,194,444, in 1928, as against 2,705,240 tons, in value \$50,193,057, in 1927. Cement mills shipped 6,696,084 barrels of cement, in value \$8,233,782, in 1928, in 1927, 7,313,494 barrels, in value \$10,615,428. Clay products yielded \$4,823,670 for 1927 and \$5,181,571 for 1928. Stone was produced in 1927 to the quantity of 1,238,750 short tons, as against 1,296,440 tons in 1926, in value, \$1,797,375 in 1927 and \$2,048,193 in 1926. The yield of lime was estimated at 193,000 short tons, in value \$1,441,000, for 1928, for 1927 it was 206,010 short tons, having a value of \$1,566,287. The total value of the State's mineral product, with allowance for duplication, was \$78,640,669 for 1927, \$83,709,894 for 1926.

**TRANSPORTATION.** The total number of miles of railroad line under operation on Jan. 1, 1929, was 5281.72. No additional construction in 1929 was reported.

**MANUFACTURES.** According to the biennial Federal Census of Manufactures published by the Department of Commerce in 1929 and dealing with operations of 1927, there were in the State, in 1927, 2355 manufacturing establishments. These employed 119,093 wage earners, whose wages totaled \$105,488,817 for the year. Materials and supplies used in production cost \$317,493,407. Manufactured products attained the combined value of \$550,372,126.

**EDUCATION.** A development of the year was the transformation of the two-year normal schools into teachers' colleges. Incident to this change, a plan was worked out for the revision of the certification of teachers, with a view to requiring standard preparation of all entering the public-school system of the State as teachers after June 30, 1931. There were enrolled in the public schools, in 1929, 638,368 pupils, of whom 517,600 were white and 320,146 were colored. Of the pupils, 320,787 white and 185,350 colored, or 515,137 in all, were in the elementary grades, and 106,972 white and 16,259 colored, or 201,609 in all, were in high schools. Expenditure in the academic year 1927-28 was current, \$15,752,232, capital outlay and debt service, \$1,106,000. Salaries of teachers averaged, for 1927-28, \$587 in elementary grades; they were more than twice as high for white, as for colored, teachers. For high-school grades, they averaged \$1106, being about 60 per cent higher for white than for the colored teachers.

**CHARITIES AND CORRECTIONS.** The State Board of Administration, constituted in 1923, was the central State agency in these activities. Among the State institutions in 1929 were Alabama Reform School (colored juveniles), Vocational School for Girls, at Birmingham; Jefferson Manley Faulkner Soldiers' Home, Mountain Creek; School of Trade and Industries, Gadsden; School for the Deaf, Talladega; Bryce Hospital (white insane), Tuscaloosa; Searcy Hospital (colored insane), Mount Vernon; Parlow State School (mental defectives), State Training School for Girls, Pinson; Boys' Industrial School, Birming-

ham; Industrial School for White Blind Men, Birmingham. The two mental hospitals were under a single self-perpetuating board of trustees.

**POLITICAL AND OTHER EVENTS.** The political antagonisms left by the "Hoovercrats" desertion of the Democratic presidential candidate, Alfred E. Smith, in the campaign of 1928, had their sequel in a movement to read those who had bolted the Democratic ticket out of the party. In December, the Democratic State committee ruled that Senator Heflin, an active former opponent of Smith, was not a Democrat in good standing, and might not appear as a candidate for reelection to the United States Senate in 1930. Owing to the prevalence of the Democrats in the State, success at the primary had in recent times been equivalent to election, and consequently the action taken against Heflin amounted to an effort to exclude him from all chance of another term in the Senate. Judge Hugh Locke, a prospective candidate for the nomination for Governor in 1930, was similarly excluded. The Democratic State Committee made no effort to bar the approximate 120,000 voters who had cast ballots for Hoover from participating at future primaries as voters. The State Prohibition Law was interpreted by the State Supreme Court in a decision of December 5 to render the purchaser of liquor, if he accepted delivery, equally guilty with the seller.

Severe floods occurred in the southern part of the State in the middle of March. Elba, on the Pea River, especially suffered. According to estimates of Governor Graves about 100 persons lost their lives and some 15,000 were rendered temporarily in need of aid. A fund for their relief was raised through an appeal issued by the Governor (See FLOODS). A project for serving territory south of Red Mountain with natural gas was undertaken by the Alabama Natural Gas Corporation, which applied to the State Public Service Commission for a certificate for this enterprise in October, alleging that it had industrial needs for 5,000,000 M cubic feet of gas a year. At Birmingham the construction of the new Jefferson County Court House was carried well along toward completion, the total cost of the new building and site being estimated at \$2,750,000. A new industrial plant of the Pullman Car and Manufacturing Company at Bessemer was opened on October 1.

**OFFICERS.** Governor, Bibb Graves, Lieutenant-Governor, W. C. Davis, Secretary of State, John M. Brandon, Treasurer, W. B. Allgood, Auditor, Sidney H. Blain, State Superintendent of Education, A. F. Haiman, Attorney-General, Charles C. McCall, Commissioner of Agriculture and Industries, Seth P. Storrs.

**JUDICIARY.** Supreme Court: Chief Justice, John C. Anderson, Associate Justices, William H. Thomas, A. D. Sayre, A. B. Foster, Lucien D. Gardner, Virgil Bouldin, and Joel B. Brown.

**ALABAMA UNIVERSITY.** Of a coeducational State institution for higher learning at University, Ala., founded in 1831. For the autumn term of 1928 the enrollment was 3394, distributed as follows: Arts and science, 1571, engineering, 460, law, 141, medicine, 103, graduate, 68, education, 390, and commerce, 659. The summer-school registration was 1871. The faculty for 1929-30 numbered 145, of whom 10 were newly appointed. The productive funds of the University amounted to \$1,959,155, and the income for the year was \$1,154,354. The library contained

about 75,000 volumes, of which 20,000 were government documents. A new education building was completed during the year at a cost of \$250,000, as was also a woman's building (for art, music, and home economics) costing \$175,000; a woman's gymnasium, costing \$125,000, was under construction. President, George H. Denny, Ph.D., LL.D.

**ALASKA.** A Territory of the United States, the largest area under the American flag of any of the noncontiguous territories and possessions. It forms a great peninsula at the northwestern extremity of the North American Continent. Its total area is 586,400 square miles. The capital is Juneau, population at census of 1920, 55,036.

An increase in the production of the fisheries and mines of Alaska left it in an improved economic condition at the end of 1928, and Governor Parks reported at the end of the fiscal year 1929 that conditions continued satisfactory.

**FISHERIES.** The most conspicuous feature of the fishing industry in 1928 was the increase of the catch of salmon by about 86 per cent over that of 1927. This was due above all to heavy runs of the red salmon in Western Alaska and of pink salmon in the southeastern portion of the Territory. The product of the fisheries attained the value of \$54,545,588 for 1928, thus exceeding that of the year previous by \$14,382,288. The total in either year included added value imparted by such manufacturing processes as—

The value of the fish catch of 1928 as—  
The fishermen was placed at \$17,343,000 for 1928. Of this value, salmon and herring made up the chief part. There were landed in 1928, 517,069,403 pounds of salmon and 134,020,216 pounds of herring. The number of persons employed in the commercial fisheries, 31,086 for 1928, exceeded by 2214 the number so employed in the year preceding. The majority of these people, 17,326, were whites, the Alaskan native fishery employees numbered 5614, and the remainder of those engaged were Filipinos, Japanese, Chinese, Mexicans, and Negroes. The canned salmon produced in 1928 furnished 96 per cent of the value of the entire year's product of the fisheries.

In the canning of salmon alone were employed 24,428 persons. There were canned 6,083,903 cases of salmon, in value \$45,383,885. This was the product of 163 canneries, as against 145 canneries that operated in 1927.

There was a considerable industry in the curing of salmon. Fewer were treated by the mid-curing process than in preceding years, but a total of 5850 tonnes, in value \$1,101,871, were produced. Progress was made in the utilization of the waste of the salmon canneries to yield by-products, and fertilizer to the value of \$44,109 and oil to that of \$10,420 were produced. The herring fishery made a higher yield in 1928 than in 1927, owing partly to the discovery of herring in large quantity near Dutch Harbor. There were produced in 1928, 16,165,595 pounds of Scotch-cured herring, which with other products of the herring fishery, attained the value of \$3,098,467.

A falling-off in the catch of the halibut fishery in 1928 attracted new attention to the efforts of the International Halibut Commission, which for some years had been engaged in study of the state of the fishing grounds adjacent both to Alaska and to the western shore of Canada. The probability was suggested by the Governor of Alaska that, for the restoration of the halibut, a protracted restriction of fishing would be re-

quired. Cod fishing in Alaska likewise fell off in 1928, as did also whaling. There were engaged in whaling in 1928, 230 persons. Whales taken numbered 402. The yield of oil was: Sperm, 93,750 gallons, other, 730,650 gallons. The entire value derived from the whale catch was \$454,274 for 1928, as against \$622,412 for 1927.

**SEALING AND FURS** The Bureau of Fisheries took its annual count of the fur seals at the Pribilof Islands in August, 1928. It reported 871,513 seals. This number indicated an increase of 62,623 over the total reported in 1927. As compared with 132,000 seals reported in 1911, at the time when the United States Government took control of the task of watching the herds, their numbers had multiplied about six fold. The policy of killing only the bachelor seals for their skins was continued. Restricted killing on this plan yielded 31,099 skins in 1928, a number greater by 24 per cent than the kill of 1927. Fewer skins were sold than were taken, sales in 1928 totaled 28,929 skins and yielded \$896,383.

**MINERAL PRODUCTION.** Gold and copper, the two dominant mineral products, were more actively mined in 1929 than in 1928. The increase in gold production followed on an increase for the year 1928, over that of 1927. In the case of copper, the value of the product of 1929 was about equal to that of the yield of 1927, and thus simply marked a recovery from the reduced total for 1928. Coal, third in point of yearly value among the mineral products, yielded less in 1929 than in 1928.

The value of the mineral output of the Territory for 1929, as approximated by the Department of the Interior, was as follows: Gold, \$7,748,000, copper, \$7,233,000, silver, \$240,000, coal, \$496,000, other minerals, lead, petroleum, marble, tin, and platinum included, \$388,000. Total, \$16,105,000.

The mineral products of the Territory attained for 1928 the aggregate value of \$14,061,000, as against \$14,304,000 for 1927. The yield of the copper mines fell off sharply for 1928, as to value, thus prolonging a decline that had gone on year by year from 1924 without halt. The value of copper mined in 1928 was \$5,965,000, as against \$7,250,000 for 1927. Copper mines were operated in but two localities, Kennecott, in the Copper River district, and Latouche Island. The diminished value of the product of 1928 was ascribed in part to the factor of price but also to the absence of newly discovered deposits of the grade requisite to take the place of the old. The production of gold, on the other hand, increased so much in 1928, as compared with 1927, as to make up the greater part of the aggregate loss in yearly mineral yield occasioned by the decline of the copper industry. There was produced in 1928, \$6,845,000 of gold, as against \$5,927,000, the value of the yield of 1927. The value of the gold production of 1928 thus surpassed that of the copper production and became for the first time in a number of years the chief element in the mineral yield. The year was remarkable in gold mining for the further reason that, while the placer yield of gold had long exceeded that from the lode workings, the position was reversed in 1928, the lode yield exceeding the placer. Production of silver in the Territory was adversely affected by the copper decline, as the greater part of the silver produced, normally some 75 per cent, comes from ores worked primarily for copper. The value of silver was estimated at \$273,-

000 recovered in 1928, as against \$356,000 in 1927. A limestone quarry capable of yielding several thousand tons a day was opened in 1928 on Dall Island, 50 miles west of Ketchikan, as a source of supply for a cement plant near Seattle, Washington. The production of lead, marble, tin, and platinum went on in 1928 on a small but increasing scale.

**Coal Mining.** There were mined in 1928 125,289 tons of coal, in value \$624,000. The total coal yield for 1928 was some 20 per cent in excess of that for 1927, which in its turn had surpassed that of any earlier year. The coal was mined almost entirely in the Matanuska field, near Anchorage, and in the Healy River area, near Fairbanks, both of which were served by the Alaska Railroad. The only petroleum production reported for 1928 was that from about Katalla, near the Bering River, where a number of shallow wells yielded an oil of paraffin base in small quantity, which was refined for the market near at hand.

**FINANCE.** The balance in the Territorial treasury on June 30, 1929, was \$1,059,153. The assessed valuation of incorporated towns in 1929 was \$23,444,671, and exceeded their assessed valuation of 1927 by \$753,885. Deposits in the territorial and national banks rose to \$12,754,500 at the end of June, 1929, from \$12,196,500 at the end of June, 1928.

**TRANSPORTATION.** As rendered in the Governor's report for the fiscal year 1929, the annual deficit of the Alaska Railroad, the great government-owned line of the Territory, increased anew. The receipts of the railroad for the year were less by \$950,712 than the expenditures, capital charges not included. The gross revenue was \$1,269,634. The rise in deficit was ascribable to decreased gross revenue. This in turn resulted from a decline in shipments of machinery and construction supplies, only partly overcome by heavier shipments of coal. In order to promote colonization along the railroad line, a representative was engaged to travel among farming communities of the western United States.

**Roads and Trails.** The Territorial and Federal authorities in cooperation built in 1928, 45 miles of road, 48½ of sled road, and 104 miles of trail, 65 miles of road were surfaced. There were under maintenance 1271 miles of road, 84 of tramway, 742 of sled road, 4389 of permanent trail, and 736 of telephone line. Airplane landings to the number of 27 also were maintained. Expenditures of 1928 for all these activities amounted to \$1,447,164.

**Aviation.** The steady progress made by commercial aviation as a method of transportation in the Territory had gone on for about seven years. It is encouraged by the Territorial government's expenditure of about 30 per cent of its road appropriation for the construction of landing fields. There were in 1929, 67 landing fields in the interior, and flying was maintained at all seasons of the year.

**EDUCATION.** For the needs of the Territorial schools in the two-year period, 1929-1930, an appropriation of \$1,074,300 was made by the Territorial Legislature. Out of this appropriation were drawn also the expenses of the Alaska Agricultural College and School of Mines. The Territorial school system was supplemented by Federal schools maintained out of government funds derived from taxes and other sources within Alaska. The number of schools operating in 1928-

20 included high schools, 15, elementary, 89 Teachers numbered 235, pupils, 5032 There were in addition a system of schools operated by the Federal Government for the especial education of the natives; such schools numbered 97 and had 3832 enrolled pupils and 177 teachers

**POLITICAL EVENTS** The Territorial Legislature passed a resolution favoring the construction of an international highway passing through Canada and connecting Alaska and the United States The supervision of the reindeer industry of the Territory was transferred by order of the Secretary of the Interior, effective Nov. 1, 1929, from the Office of Education to the Territorial Government See **EXPLORATION**, also **EARTHQUAKES**

**ALBANIA**, *al bā'nī-n* A kingdom in the Balkans consisting of the former Turkish provinces of Scutari and Yanina and parts of the Turkish vilayets of Monastir and Kassoia Capital, Tirana, reigning King, Zog I

The boundaries were fixed as a result of the work of an international commission appointed in 1922, which did not complete its labors, however, until 1925 The probable area of the country is estimated at about 17,347 square miles, the population is estimated at 833,618, of whom 563,729 were Mohammedan, 181,051 Greek Catholic, and 88,739 Roman Catholic The country is divided into eight provinces named after the chief towns The latter, with their estimated populations, are as follows Tirana, 16,000, Scutari, 23,800, Korytza, 25,000, Elbasan, 10,400, Argirocastro, 12,000, Berat, 3500 Valona, 6300, and Durrazzo, 5100 The principal race groups are the Ghegs in the North and the Tosks in the South Agriculture is very primitive and large tracts of land remain uncultivated The chief products are tobacco, timber, hides, furs, wool, olive oil, corn, and cattle The mineral wealth is reputed to be considerable although almost entirely undeveloped Drillings for oil have seemed to indicate its presence in commercial quantities A coarse native cloth is manufactured from wool, but for the most part such manufactures as exist in the country pertain to the working up of agricultural products

Albania has been handicapped by natural conditions—mountains, primitive roads, lack of railroads, and undeveloped natural resources As an agricultural country, with practically no native industries, it is entirely dependent on imports of manufactured goods The latest returns for commerce, those for the calendar year 1927, showed imports of \$4,764,843 and exports of \$2,144,189, leaving an unfavorable trade balance of \$2,620,654 The chief articles of import for 1927 were cotton manufactures, woolen goods, sugar, rice, coffee, machinery, kerosene, gasoline, and leather The chief articles of export for the same year were cheese, grains, eggs, skins and hides, lambs, and wool Italy buys most of the exports and supplies most of the imports The budget for 1928-29 provided for expenditures of 26,984,422 gold francs and revenues of 28,645,000 gold francs (one gold franc = \$0.193 par value)

**HISTORY.** The independence of Albania from Turkey was proclaimed and recognized in 1912 and Prince William of Wied accepted an invitation to become King At the outbreak of the World War, he left the country, which then fell into a state of anarchy On June 3, 1917, it was again declared independent by General Ferrero, in charge of the Italian forces in the country, and a provisional republican government established

at Durazzo The Republic was changed to a monarchy by a constituent assembly on Sept. 1, 1928, and Ahmed Zogu, the President of the Republic, was proclaimed King with the title Zogu or Zog I He is also sometimes referred to as Scanderbeg III His régime was generally recognized by the European Powers, despite the continuance of a defensive alliance his former administration had concluded with Italy, Nov. 22, 1927 A new constitution, promulgated Nov. 22, 1928, provided for the Chamber of Deputies, elected on the basis of one deputy for every 15,000 inhabitants, and the Council of State of ten members chosen by the King from candidates presented by the Prime Minister, the President of Parliament, and the Minister of Justice

Albania, during 1929, was comparatively peaceful and a number of public improvements and financial reforms were carried out The severe drought of 1928, which destroyed many of the crops, adversely affected the budget for 1929 and the King secured a three-year moratorium on debt payments on the Italian loan of 1926 He also reduced the army, eliminated superfluous officials, and in general initiated a programme of rigid economy A civil code promulgated in March provided for the registration of all marriages and divorces with the civil authorities, abolished polygamy among the Moslem tribes, and provided for the regulation of religious rites and services throughout the country The Independent Albanian Orthodox Church was established by secession from the Ecumenical Patriarchate The Moslem Church elected an Albanian Caliph to replace the defunct Caliphate once vested in the sultans of Turkey The Moslem *hodjas*, or priests, were forced to recite the Koran in Albanian instead of Arabic

With religion thus nationalized, steps were taken to modernize the land system, which was still feudal in nature, much of the land being in the possession of a small land-owning class Efforts were also inaugurated to modernize methods of agriculture, to combine the two Albanian dialects into a common language, and to extend the public works programme Construction of a new royal palace, to cost \$1,000,000, was commenced and the first building constructed by the United States on foreign soil for the use of its diplomatic and consular representatives was completed at Tirana It was announced that the Government had granted a monopoly on oil sales to an Italian company, Agip, which privately agreed with the Standard Oil companies to purchase from them all of the oil sold in Albania

Political difficulties, arising in connection with the Parliament in October, were summed up by the King A deputation of members of Parliament who presented a list of grievances to him was thrown into prison and several newspapers daring enough to publish comments upon a cabinet crisis were suppressed

**ALBERTA**, *al-bôr'ta* A northwestern province of Canada, formerly *Alberta*, of a large part of the Northwestern Territory, bounded on the east by Saskatchewan, on the west by British Columbia, and on the south by the United States Area, 255,285 square miles, population in 1929, 646,000, as compared with 496,442 in 1916 The rural population in 1926 numbered 374,614 and the urban, 232,970 Chief towns with their populations according to the census of 1926 Calgary, 65, . . . (the capital), 65,163; Lethbridge, 10,893; and Medicine Hat,

9536 The movement of population in 1927 was. births, 14,630; deaths, 5027; marriages 4703.

The chief occupation of the province is agriculture, but there are valuable deposits of coal, natural gas, and petroleum. Besides the raising of grain, livestock and dairying are the chief industries. The acreage under crop and the actual production of grains in 1928 were as follows: Wheat, 6,707,526 acres, 155,602,000 bushels, oats, 2,340,263 acres, 88,257,000 bushels, barley, 545,524 acres, 15,849,000 bushels, rye, 102,020 acres, 2,680,000 bushels, flax, 6182, acres, 61,000 bushels, peas, 1299 acres, 21,000 bushels, beans, 302 acres, 3500 bushels, mixed grains, 14,094 acres, 409,000 bushels. The total acreage under cultivation in 1928 was 15,320,155 and the total value of production was \$204,607,299. According to estimates, Alberta has 14 per cent of the coal reserve of the world. The 1928 production was 7,335,489 tons, the 1927 production, 6,934,162 tons, valued at \$21,982,058. In 1927 the value of the natural-gas output was \$3,586,533. The production of petroleum was 318,741 barrels, valued at \$1,185,948. The total value of all mineral production in 1929 was \$32,367,781 (preliminary figures).

The executive power is nominally vested in a lieutenant-governor appointed by the Dominion government, but it actually rests in an executive council, or cabinet. Legislative power is in the Assembly, which is elected by direct vote, including woman suffrage. Of the 59 members in the Legislature in 1927, there were 43 United Farmers of Alberta, 7 Liberals, 6 Laborites, and 5 Conservatives. Alberta is represented in the Dominion Parliament at Ottawa by 6 members in the Senate and 16 in the House of Commons. Expenditures in 1927 totaled \$12,479,381 and revenues, \$12,263,401. The bonded indebtedness in 1927 was \$90,890,458. Lieutenant Governor in 1929, Dr. W. Egbert, Prime Minister, John E. Brownlee.

**HISTORY.** Among the outstanding developments in the province in 1929 were the inauguration of an old-age-pension system, the development of a movement for extension of the northern boundary to the shores of the Arctic and the signing at Ottawa on December 15 of an agreement with the Federal government providing for the return to the province of its natural resources. The agreement was to be ratified by both Dominion Parliament and the Provincial Legislature before becoming effective. The severe drought in the Canadian prairie provinces during the summer was mitigated to a considerable extent in Alberta. See CANADA.

**ALCOHOL.** See CHEMISTRY, INDUSTRIAL.

**ALCOHOLISM.** See PROHIBITION.

**ALFALFA.** The production of alfalfa hay in the United States in 1929 was estimated by the Department of Agriculture at 29,847,000 tons as compared with 29,135,000 tons in 1928. The production by States for the year was not available. Largely due to diseases, especially wilt, the acreage of alfalfa and the production of alfalfa hay declined to some extent during recent years in some of the leading producing sections of the northern Mississippi Valley, but Nebraska, a leading . . . State, reported a yield of 2,717,000 . . . hay in 1929, an increase of 84,000 tons over the yield of the preceding year. On October 15, the estimated average price of alfalfa hay received by producers was \$13.84 per ton, or \$1.02 above the average price on Oct. 15, 1928. A new market-news service on alfalfa

hay, established during the latter part of the year by the Department of Agriculture, consists in issuing each Tuesday reviews of market conditions in the leading producing areas and including prices of the principal grades at the most important markets in the West and Southwest.

The production of alfalfa seed in 1929 was placed at 717,800 bushels, as against 532,400 bushels the year before, representing an increase of 35 per cent. The average annual production is about 930,000 bushels. The average yield per acre was estimated at 2.78 bushels, or only 0.1 bushel above the average acre yield in 1928. The area devoted to the crop in 1929 was 258,400 acres, while the preceding year the area was only 198,000 acres. The highest average yield per acre, 4.5 bushels, was reported from Arizona and the lowest, 1.9 bushels, from Utah. Idaho and Colorado each reported an average yield of 4 bushels per acre for the State. All leading seed-producing States except Utah reported increased yields. The leading States and their yields were as follows: Utah, 107,000 bushels, Arizona, 100,000 bushels, Idaho, 92,000 bushels, Montana, 72,000 bushels, South Dakota, 58,800 bushels, and Kansas, 50,000 bushels. These States produced about two-thirds of the year's yield. In acreage, Utah led with 55,000 acres, followed by Montana with 30,000, South Dakota with 28,000, Idaho with 23,000, and Arizona with 22,000 acres. On October 15, the estimated average price received by growers was \$11.68 per bushel, as against \$10.71 on Oct. 15, 1928. During the fiscal year ended June 30, 1929, the imports of alfalfa seed amounted to 1,146,000 pounds, including 465,200 pounds from Estonia, 317,900 pounds from Argentina, 198,500 pounds from Germany, but practically all of Turkish origin, and 154,000 pounds from Canada. During the same period, 817,000 pounds were exported.

**ALGERIA.** A colony of France forming politically a part of France itself, situated in northern Africa. It comprises the two great divisions of Northern and Southern Algeria, which in turn are divided as follows: Northern Algeria into the departments of Algiers, Oran, and Constantine. Southern Algeria into the territories of Annaba, Ghardaia, Tougourt, and the Oases of Sahara. Of the total area estimated at 1,069,000 square miles, all but 222,200 square miles are desert, population, including military forces, according to the census of Mar. 7, 1926, 6,063,496, of whom 5,521,271 were in Northern Algeria. In 1927 the estimated population was 6,130,000. The Europeans numbered 833,359. All but a small fraction of the population inhabited the towns and cities. Chief towns with their populations for 1926: Algiers, 226,218; Oran, 150,301; Constantine, 93,733 (these three being, respectively, the capitals of the provinces of the same name); Bône, 51,895; Tlemcen, 26,758; Sidi-bel-Abbes, 43,148; Blida, 24,758; Tizi Ouzou, 2044; Philippeville, 29,242; and Sétif, 26,677.

The race groups in the native population are principally Arabs, Berbers, and Kabyles, and the prevailing religion is Mohammedanism. The chief Christian church is the Roman Catholic which maintains an archbishop and two bishops. In 1927 there were 1380 primary and infant schools, public and private, with 114,250 pupils. There were also 17 establishments for secondary education with 9135 students. For higher education, there is a university at Algiers which had 1720 students in the fall of 1927, and there are special

schools of commerce, hydrography, agriculture, and the fine arts. There are also higher Moslem schools at Algiers, Constantine, and Tlemcen.

**PRODUCTION.** Algeria is primarily an agricultural country. Arable land in 1928 totaled 15,798,000 acres, natural and improved pasture, 11,021,000 acres, and the area under productive trees and shrubs, 534,000 acres. The area and production of the principal crops in 1927 and 1928 is shown in the accompanying table.

ALGERIAN CROPS AREA AND PRODUCTION

Crop	Area *		Production *	
	1927	1928	1927	1928
Wheat	3,469	4,656	28,323	30,302
Barley	3,360	3,411	34,555	39,718
Oats ..	527	601	10,607	14,492
Corn	24	23	241	261
Potatoes	24	27	1,889	1,666
Grapes vines	533	548	212,169	361,032
Olive orchards	100	101	5,359	4,113
Tobacco	79	65	58,461	68,000
Cotton	12	13	1,912	3,346
Dates			253,066	

\* Thousands of acres

\* Thousands of units—bushels except as indicated

\* Unit, gallon of wine

\* Algiers and Oran

\* Unit, gallon of oil.

† Unit, pound

As indicated by the table, cereals are by far the most important crops, followed by grapes. Uncertain climatic conditions result in a large export surplus of cereals in some years, while in others imports of cereals are required to make up for crop shortages. In 1928 the agricultural situation was generally satisfactory, the cereal crop exceeding local requirements and the wine crop being of record quantity, although below average in quality. The government was encouraging the development of silk cocoon production. Livestock in 1928 included 887,000 cattle, 5,397,000 sheep, 2,920,000 goats, 89,000 swine, 164,000 horses, 164,000 mules, 279,000 asses, and 173,000 camels. Wool production in 1928 totaled 38,764,000 pounds, as compared with 36,800,000 pounds in 1927.

The chief mineral products are iron ore and phosphates. The output of iron ore in 1928 was 2,023,000 metric tons (2,029,000 in 1927), of phosphates, 817,000 metric tons (847,000 in 1927). Iron pyrites, zinc, lead, copper, coal, and petroleum are other products.

**COMMERCE.** Foreign trade in 1928 reached its highest level in eight years, exports amounting to \$156,631,000 and imports, to \$194,751,000. The imports were 13 per cent higher than in 1927 and the exports, 14 per cent higher. The trade balance had been unfavorable every year since 1919. The chief imports in 1928 were cotton fabrics, metal manufactures, automobiles, sugar, wheat, chemicals, and coal, the chief exports, wine, iron ore, fish, sheep, phosphate rock, barley, goats (pearled grain), peas, and tobacco leaf. About 79 per cent of the imports came from France and 70 per cent of the exports went to that country. Coal was the principal export to the United States. Total declared exports to the United States in 1928 amounted to \$4,379,000, a slight decline from 1927.

**FINANCE.** Government receipts in 1928 amounted to 924,000,000 francs (\$36,200,000), while real expenditures were 796,500,000 francs (\$31,200,000). Receipts and expenditures in the 1929 budget balanced at about 1,320,000,000 francs (\$51,700,000). The budget for postal, tele-

graph, and telephone operations balanced at 153,060,000 francs. The sum of 1,017,000 francs was included in the general budget for agricultural experimental stations. On Jan. 1, 1929, the public debt amounted to 830,000,000 French francs (\$32,336,000). On the same date, the total cover of bank notes was approximately 670,000,000 francs and the note circulation was 1,777,484,000 francs, as compared with 1,335,310,000 francs on the same date in 1928.

**COMMUNICATIONS.** Transportation facilities are of primary importance, particularly in view of the vastness of the country. As the railways are inadequate, the highways provide the only means of reaching many localities. Accordingly, their upkeep and the creation of new roads form one of the major items of the budget. Expenditures on national highways, which in 1927 extended 3325 miles, and on local and departmental roads and paths, totaling another 12,898 miles, were 46,400,000 francs. There has been an encouraging increase in the length of the railways, which in 1927 totaled 2853 miles, of which 1905 miles were state owned. Gross receipts during 1928 amounted to 300,293,000 francs. In 1928, 4585 vessels of 7,758,000 net registered tons entered Algerian ports and 4915 vessels of 8,288,000 tons cleared.

**GOVERNMENT.** The central executive authority of the local government is the governor-general who directs all the services with the exception of the non-Muslim departments of public instruction, justice, worship, and the treasury, which are each under a separate ministry. The governor-general, with the minister of the interior, prepares the budget which is voted by the so-called financial delegations and by the Superior Council. The colony sends to the home Parliament one Senator and two Deputies from each of the three departments. The Parliament at Paris has the sole right to legislate for Algeria. Governor-General in 1929, Pierre L. Boix, appointed in November, 1927.

**ALLEGHENY COLLEGE.** A coeducational institution of higher learning in Meadville, Pa., nonsectarian in policy but under the patronage of the Methodist Episcopal Church, founded in 1815. The enrollment for the autumn of 1929 was 642, distributed as follows: Seniors, 102, juniors, 138, sophomores, 185, freshmen, 212, and special, 5. The registration for the 1929 summer session was 156. The faculty in the autumn of 1929 numbered 41. The productive funds of the college amounted to \$1,400,000, and the income for the year 1928-29 was \$786,001. Two new buildings were completed in 1929: Atter Hall, a recitation building, the gift of the late Frank A. Atter of Cleveland, Ohio, and Calhoun Memorial Hall, a freshman dormitory for men, the gift of Mrs. Margaret E. Calhoun of Union City, Pa. W. E. Reis of Pasadena, Calif., gave the college \$50,000 for the enlargement of the Reis Library, which in 1929 contained 74,000 volumes. President, James A. Beebe, D.D., LL.D.

**ALLEN, EDWIN WEST.** American agricultural chemist, died Nov. 11, 1929, in Chicago, Ill. He was born Oct. 28, 1864, in Amherst, Mass., and was graduated from the Massachusetts Agricultural College and Boston University in 1885, studying later at the University of Göttingen. In 1890 he entered the service of the U. S. Department of Agriculture, becoming assistant director in the Office of Experiment Stations in 1893 and chief in 1915. From 1895 to 1924, he was editor-in-chief of the *Experiment Station Record*, and

in 1926 he became editor of the *Journal of Agricultural Research*. With Dr. Alfred Charles True (q.v.), Dr. Allen organized and conducted the agriculture department of the NEW INTERNATIONAL YEAR BOOK from its foundation in 1899. He was also an editor in the department of agriculture of the NEW INTERNATIONAL ENCYCLOPEDIA and its SUPPLEMENT, also contributing many of the articles.

**ALLIANCE FRANÇAISE, FÉDÉRATION DE L'** An association of clubs and groups formed for the purpose of encouraging and furthering the study and cultivation of the French language, literature, art, and history in the United States. It was established in 1902, and in 1929 comprised more than 250 local branches, including French Alliances, affiliated societies, and French clubs in universities, colleges, and schools. Six new groups were added to the federation during 1929. Each year the Alliance Française brings from France one or more lecturers who are prepared to speak before all the affiliated societies and clubs wishing to hear them. It also organizes lecture tours for distinguished French travelers and for French lecturers who live in America, assists in organizing courses in the French language and literature in cooperation with the leading universities, and encourages its groups to engage in dramatic performances and debates in French. The official lecturers from France during the season 1928-29 came under the auspices of the Fédération de l'Alliance Française, the France-America Society, and the American Society of the French Legion of Honor. They were Daniel Michenot, professor of diction and lectures at the University of Strassburg, and Francis Funck-Brentano, member of the Institut de France, who has acquired a wide reputation as a historian, his best known works being *La Vie à la Bastille*, *Légendes et Archives de la Bastille*, and *Les Lettres de Cachat*. The federation's Assemblée Générale, attended by representatives of the various groups, was held at the Hotel Plaza, New York City, April 6, 1929. The official periodicals of the organization are *L'Echo de la Fédération* and *Bulletin Officiel*. Officers in 1929 were Frank D. Pavey, president, William Nelson Cromwell, general vice president, Albert Blum, president of the executive committee, James N. B. Hill, treasurer, and Félix Weil, general secretary. Headquarters are at 32 Nassau Street, New York City.

**ALLOYS.** See CHEMISTRY, INDUSTRIAL; METALLURGY.

**ALSACE-LORRAINE**, al'zās'lor'ān'. The provinces taken from France by Germany after the Franco-Prussian War of 1870-71 and restored to France after the Armistice of Nov. 11, 1918, constituting at present the three French departments of Bas-Rhin, Haut-Rhin, and Moselle. Total area, 5005 square miles, total population in 1926, 1,795,100. The area and population are distributed among the three departments as follows: Bas-Rhin (formerly Lower Alsace), 1848 square miles and 670,985 inhabitants, Haut-Rhin (formerly Upper Alsace), 1354 square miles and 490,654 inhabitants, Moselle (formerly Lorraine), 2403 square miles and 633,461 inhabitants. Alsace-Lorraine contains the only petroleum fields of commercial importance in France, but supplies only about 10 per cent of the total consumption. Iron ore is mined in large quantities. Potash production was affected favorably by the agreement between the Alsatian and German

mines for a division of the world market. In January, 1926, the autonomy of the port of Strassburg was established.

The autonomist movement in Alsace reached a critical stage early in 1929, as a result of elections held in the department of Haut-Rhin January 13 and 20. Autonomist candidates were elected by large majorities to the two seats in the French Chamber of Deputies left vacant by the refusal of the Chamber to seat the Alsatian deputies, Ricklin and Rossé, who were convicted at Colmar in May, 1928, of engaging in an autonomist conspiracy. The elections were followed by a two weeks' debate in the French Chamber on the Alsatian question, in which Premier Poincaré said that while France would respect the existing connection between Church and State in Alsace, she would insist upon the maintenance of the *status quo*.

**ALUMINUM.** The value of new aluminum produced in the United States during 1928 was \$47,899,000, an increase of 22 per cent, as compared with 1927, when primary metal to the value of \$39,266,000 was produced. The principal producing plant was at Massena, N. Y., where approximately 45 per cent of the metal made in the United States was recovered. During 1929 there was erected at this plant a blooming and structural mill capable of producing, in the strong aluminum alloys, structural shapes 14 inches in depth and 90 feet in length. In this mill, it was possible to handle blooming ingots up to 21 feet to 3000 pounds. The casting technique, as large as these and heat-treating equipment and methods for large structural shapes were important developments in this field. Besides the large plant mentioned, other important works were at Niagara Falls, N. Y., Alcoa, Tenn., and Badin (Whitney), N. C. New production in 1929 totaled 225,000,000 pounds, valued at \$51,804,000.

In addition to the new aluminum produced in 1928, secondary metal to the value of \$22,083,000 was produced. The domestic price obtained for aluminum ingot in 1929, as in 1928, was 24 3/8 cents a pound. The reason for the increased production of aluminum in 1928 was due to its increased consumption by the automotive industries and particularly the wider adoption of aluminum pistons and connecting rods. Also aluminum furniture had acquired a position of prominence and many railroads had adopted aluminum chairs as standard equipment in dining cars, while installations were being made of aluminum furniture in offices and libraries.

The imports of aluminum metal, scrap, and alloy in 1928 were 48 per cent less in quantity than in 1927, and imports of hollow ware were 13 per cent less than in the previous year. In 1929 the imports of metal, scrap, and alloys of aluminum amounted to 48,370,921 pounds valued at \$8,973,233, as against 37,895,832 pounds in 1928. Manufactures in the form of plates, sheets, bars, etc., amounted to 22,010 pounds, valued at \$8724, hollow ware amounted to 123,024 pounds valued at \$71,046, while other manufactures of aluminum were valued at \$872,908. The exports of aluminum, including laurite, and other ores and concentrates, in 1929 were valued at \$11,897,368, as compared with \$12,102,402 in 1928. There were also included ingots, scrap, and alloys amounting to 613,366 pounds and valued at \$117,345, plates, sheets, bars, strips, and rods amounting to 16,418,751 pounds and valued at \$4,032,194, tubes,

moldings, castings, and other shapes amounting to 2,466,508 pounds and valued at \$738,376, table, kitchen, and hospital utensils valued at \$708,467, and other aluminum manufactures valued at \$2,374,703

With the advent of large structural shapes, new uses for aluminum were found in street cars and motor trucks and also in the construction of cranes where a 50 per cent saving in weight was reported in connection with a 10-ton crane. In architecture, important applications of aluminum were made in the Chrysler Building in New York City and in the Cathedral of Learning of the University of Pittsburgh, Pittsburgh, Pa. Aluminum for cables and tanks was being extensively used in the oil field, as well as aluminum paint for oil tanks. Aluminum foil also was used in the oil fields and refineries of preserving steel and wood. Naturally, with the increased aircraft construction in the United States, greater quantities of aluminum and aluminum alloys found their way into this industry than ever previously. See METALLURGY

**AMERICA.** See ANTHROPOLOGY  
**AMERICAN ASSOCIATIONS AND SOCIETIES.** For various scientific and other organizations whose official titles begin with the word American, see under the important descriptive word of the title.

**AMERICAN CHEMICAL SOCIETY.** See CHEMISTRY, INDUSTRIAL.

**AMERICAN LEGION.** An organization of World War veterans chartered by Congress in 1919. Its purpose is "to uphold and defend the Constitution of the United States, to maintain law and order, to foster and perpetuate a 100 per cent Americanism, to preserve the memories and incidents of association in the Great War; to inculcate a sense of individual obligation to the community, State, and nation, to combat the autocracy of both the classes and the masses, to make right the master of might, to promote peace and good will on earth, to safeguard and transmit to posterity the principles of justice, freedom, and democracy, to consecrate and sanctify the comradeship of the members by devotion to mutual helpfulness."

The eleventh annual convention of the Legion was held Sept 30 to Oct 3, 1929, in Louisville, Ky. There was an accredited delegate attendance of 1148, representing every State, the District of Columbia, five territorial, and five foreign, Legion departments. The retiring national commander, Paul V. McNitt, in his annual report to the convention, cited the carrying out of the Legion's objectives for the year, as fixed by the preceding national convention. The recovery of monetary rewards for disability compensation, death compensation, insurance, adjusted compensation, and retirement claims for veterans totaling \$4,127,225 for the 12-month period—the largest total for a similar period in the history of the Legion, progress in inducing States to pass legislation of benefit to the orphaned and needy children of World War veterans; the participation of more than 300,000 boys under 17 years of age in the junior baseball programme sponsored to the extent of \$50,000 by the American and National Baseball leagues, the enactment of amendments to the Adjusted Compensation Act and of legislation providing \$9,250,000 for the construction and improvement of the Veterans' Bureau hospitals, the nation-wide campaign in favor of the adoption by Congress of the Wain-

wright-Reed Resolution, which provides for a commission to draft legislation looking to a more equal distribution of burden in time of war, as summed up in the universal-service bill, and the passage of a measure sponsored by the Legion providing for Gold Star mothers and widows of American soldiers buried in France to visit the graves at government expense. The national convention reaffirmed the Legion's stand on promoting an adequate national defense and the bringing about of world peace, and voted to continue its interest in military and commercial aviation and other broad programmes of endeavor.

Among the distinguished speakers at the convention were Maj. Gen. Peyton C. March, U. S. A., retired, who served as chief of staff of the U. S. Army during the World War, Admiral Hugh Rodman, U. S. N., retired, Gen. Charles P. Summerall, U. S. A., Serg. Samuel Woodfill, selected by Gen. John J. Pershing as one of the greatest outstanding heroes of the World War, Frank T. Hines, director of the U. S. Veterans' Bureau, Peter Biady, representing the American Federation of Labor, Judge Keneaw M. Landis, and Gov. Flem D. Sampson of Kentucky. A distinguished Polish delegation headed by Col. S. Zahoiski attended the convention.

The official publication of the national organization is *The American Legion Monthly*, published at 2457 East Washington Street, Indianapolis, Ind. The membership of the Legion on Aug. 31, 1929, was 782,117. The American Legion Auxiliary, composed of mothers, wives, daughters, and sisters of Legion members, had a membership of 329,213. The officers of the Legion, elected in the year 1929-30, were O. L. Bodenheimer, El Dorado, Ark., national commander, Milt D. Campbell, Cincinnati, Ohio, John J. Dugan, Wilmington, Del., Frank Schoble, Jr., Wynote, Pa., Willis M. Brewer, Pontiac, Mich., and Morton M. David, Denver, Colo., national vice commanders, the Rev. George F. Kettell, D. D., Macedon, N. Y., national chaplain. The following four national officers continued in office: James F. Baiton, Fort Dodge, Iowa, national adjutant, Scott W. Lucas, Havana, Ill., national judge advocate, Bowman Elder, Indianapolis, Ind., national treasurer, and Eben Putnam, Wellesley Farms, Mass., national historian. The permanent headquarters of the Legion are in the War Memorial Building, Indianapolis, Ind.

**AMERICAN REVOLUTION ANNIVERSARIES.** See CELEBRATIONS

**AMHERST COLLEGE.** An institution for the higher education of men in Amherst, Mass., founded in 1821. For the autumn term of 1929, approximately 720 students were enrolled, including Fellows, 11, graduate students, 13, seniors, 153, juniors, 171; sophomores, 159, freshmen, 201, and provisionally enrolled, 14. The active faculty, exclusive of administrative officers, emeritus professors, and those on leave, numbered 73. The productive funds of the college amounted to \$7,594,777, and the income for the year was \$741,847. The library contained 162,000 volumes. During the year, the George William and Kate Ellis Reynolds Lectureship Fund was established by a gift of \$142,000. President, Arthur Stanley Pease, Ph.D.

**ANEMIA.** See FERTILIZERS  
**ANEMIA, PERNICIOUS.** In the *Munchener medizinische Wochenschrift* for August 16, Hoffer compares human pernicious anemia to the

infectious anemia of the horse. The parallel is very close, although thus far the characteristic tongue in the human form has not been encountered in the horse. The alterations found after death in the equine form, although scanty, agree with the few changes found in man, and are not at all specific. The blood picture differs but slightly in the two forms. Thus far, only three equine cases have been subjected to the liver treatment and apparently the results were equal to those seen so freely in mankind. Blood production was stimulated while blood disintegration was checked. The principal difference naturally is in the mode of origin, but while in the horse it is due to infection and nothing comparable has yet been found in man, it is not unlikely that the study of the equine disease may in the end throw light on the human form. Transmission from horse to horse is extremely irregular, follows no definite laws. In discussion, Dr Hesse pointed out that the liver treatment was of value in other than pernicious anemia in mankind, so that in claiming identity we should not place too much stress on response to treatment.

**NATURE OF THE CURATIVE ACTION OF LIVER EXTRACT.** This subject was discussed at length at the session of the Biological Section of the Hamburg Medical Union, June 4 (*Klinische Wochenschrift*, September 10). Even in healthy subjects, liver extract will increase the number of the red cells of the blood. Fahr was unable to believe that the extract can prevent the causes of the solution of the red cells which characterizes the disease and to him, the principle of the cure suggests that involved in the action of vitamins in deficiency diseases. Lichtwitz yet did not feel assured that all cases of pernicious anemia are permanently curable by liver extract. Wohlwill, speaking as a pathologist, notes that pernicious anemia is less frequently seen in the dead house than before the liver treatment was introduced. Pashen mentioned one case in which pushing the extract in large doses was responsible for a very great increase of red cells, and Reye reported a similar experience. Schottmüller had seen but one failure in 50 cases treated. Extirpation of the spleen is no longer practiced in this disease, but according to Ehlecker it is well to add transfusions to liver extract in severe cases, a view which was accorded the support of Hegler.

**ANALYSIS, CHEMICAL.** See CHEMISTRY.  
**ANAPLASMOSIS.** See VETERINARY MEDICINE.

**ANDORRA**, an-dō'ra. One of the smallest republics in the world, under the joint sovereignty of the French President and the Spanish Bishop of Urgel, situated in a valley of the Pyrenees Area, 101 square miles, population, 5231, scattered in six villages. The inhabitants speak Catalan and are Roman Catholics. The government is under a council of 24 members which nominates the First Syndic in whom is vested the executive power. A good road runs from the Spanish frontier to Andorra. In 1920 it was reported that an attempt of the Spanish Government to levy troops in Andorra was met with a threat of armed opposition from the inhabitants. The little Republic maintains a standing army of 50 men.

**ANDOYER, MARIE HENRI** French astronomer, died June 12, 1929. He was born in Paris, Oct. 1, 1862. He entered the École Normale Supérieure in 1881, and devoted himself to the study of

pure mathematics. From 1885 to 1892, he was attached to the observatory at Toulouse and was also a professor in the faculty of science. He was recalled to Paris in 1892 to deliver a course of lectures on mathematical astronomy and celestial mechanics and to share in the teaching of mathematics in the faculty of science. He was appointed professor at the Sorbonne in 1903. In 1910 he succeeded to membership in the Bureau des Longitudes, and on the death of Radau in 1911 succeeded him as editor of the *Connaissance des Temps*. The substance of Andoyer's teaching is embodied in two works, *Cours d'astronomie* (vol. 1, 3d ed., 1923, vol. 2, 2d ed., with A. Lambert, 1924) and *Cours de mécanique céleste* (2 vols., 1923, 1926). His last important work was *Sur la théorie analytique du mouvement de la lune*. Andoyer's chief interest was in the mathematical aspect of astronomy, and in addition to his strictly astronomical writings, he recomputed and published, between 1911 and 1928, fundamental logarithmic and trigonometrical tables. He was elected an associate of the Royal Astronomical Society in 1914. He was also an Officer of the Legion of Honor.

**ANDRÁSSY, JULIUS** Hungarian diplomat and statesman, died June 11, 1929, in Budapest. Count Andrassy was born June 30, 1860, the son of a Hungarian statesman. He entered the Reichstag when 24 and later was successively Under-Secretary of the Interior, Secretary of Education, and one of the leaders of the coalition which brought about the fall of the Liberal Sisy ministry, and from 1906 to 1909 was Minister of the Interior in the compromise Wekerle cabinet. Three years later, he represented Austria in a diplomatic endeavor to prevent the outbreak of the Balkan War, and in 1915 urged the making of peace and the extension of the franchise in Hungary. As Foreign Minister of Austria-Hungary in 1918 he declared the alliance with Germany dissolved and undertook to conclude a separate peace, he retired from office the same year, but in 1920 returned to the National Assembly and assumed leadership of the Christian National party. While attempting to aid King Charles to regain his throne, Andrássy was captured and imprisoned for a time in 1921, but in 1922 he was returned to the National Assembly. He attacked the Horthy régime in Hungary in 1926 and advocated a return to a legitimate democracy, but was defeated. Count Andrassy wrote several books on political subjects, the most important *La diplomatie et l'Allemagne*, an impartial study of responsibility for the World War. Though always pro-German, he published in 1915 *Wer hat den Krieg verbrochen?* in which he belittled German and Austrian charges against Great Britain as the prime belligerent Power.

**ANEMIA.** See ANEMIA.

**ANGINA PECTORIS.** "Treatment with Purin Base Diuretics." An article with this title by Gilbert and Ker appeared in the *Journal of the American Medical Association* for January 19. The aim of the treatment is limited to the relief of pain, although it may also have other remedial properties. The total number of cases treated was 86, covering a period of 12 years and the number of patients to die in the interval was 21, many of whom were notably relieved by the treatment. A number of the purin base diuretics have been used at various times, but apparently there is little choice between the individual drugs which comprise theobromine, theophyllin

and caffeine, which the authors found efficacious in the order named. In the present series, theobromine salts were used in the great majority of cases. Results are classed as negative, slight, moderate, and marked. Percentages under these heads are not given, but several cases of remarkable benefit were noted, as in the case of a man of 72 who was kept free from paroxysms of former daily occurrence for three years, save on some occasions when he had been too active after eating. Those who received moderate benefit were satisfied to continue the remedy, which was given for four or five days at a stretch with intermissions of the same length. It is not denied that the drugs cause various unpleasant symptoms at times.

**ANGOLA**, ǎn-gô'la, or **PORTUGUESE WEST AFRICA**. A colony on the west coast of Africa, belonging to Portugal since 1575, with the exception of the years 1641 to 1648, when it was held by the Dutch. Its present boundaries were assigned by conventions of May 12, 1886, Dec. 30, 1886, May 25, 1891, and June 11, 1891, separating it from the French Congo, Southwest Africa (afterward united with the Union of South Africa), Belgian Congo, and British South Africa (now Union of South Africa), respectively. An agreement settling a boundary dispute with the Union of South Africa was ratified by Portugal and the South African Parliament in 1926. Area, 484,800 square miles; population (1926) 2,481,956 natives and about 10,000 whites, Capital, São Paulo de Loanda (population, about 23,000), other important towns, Kabinda, Ambriz, Novo Redondo, Benguella, Lobito, Mossamedes, and Port Alexander. The interior plateau lands are fertile and well watered and promise to become a great agricultural region. Lobito, considered the best natural port on the west coast of Africa, has replaced Benguella as the shipping point for southern Angola. A government wharf was completed in 1928 and further harbor improvements were under way in 1929.

In 1928 there were 52 government schools, seven municipal schools, and two private schools, with about 4752 pupils altogether. The principal products are coffee, rubber, wax, sugar, vegetable oils, coconuts, ivory, oxen, and fish. Mineral products include malachite, copper, iron, petroleum, and salt, and gold also has been found. In 1927 the imports were valued at 272,941,374 escudos (\$13,817,655) and the exports at 204,622,176 escudos (\$10,358,997). The chief imports of the province are textiles and the chief exports are coffee, maize, diamonds, and dried fish. The bulk of both the export and import trades is with the mother country. Angola has its own budget, the revenues for which are largely derived from taxation and customs duties, although from time to time the home government grants a subsidy. Budget receipts in 1927-28 were 167,559,700 angolares, expenditures, 166,217,050 angolares (one angolar equals \$0.0625). In 1928, 818 miles of railway were open to traffic. The Benguella Railway from Lobito Bay reached the border of the Belgian Congo in 1927 and was expected to reach the Katanga mining district in August, 1930, opening up a rich mining and agricultural area. There were also 2420 miles of roads and 7452 miles of telegraph lines. The government is in the hands of a high commissioner vested with large powers, whose seat of government is Loanda. The colony, according to the charter of Oct. 15, 1926, is divided into 12 administrative districts, each

under a governor. High Commissioner in 1929, Filomeno Camara.

**ANHALT**, ǎn'hált. A German free state, formerly a duchy of the German Empire, bounded by the Prussian provinces of Brandenburg and Saxony. Area, 888 square miles; population, according to the census of 1925, 351,045. Capital, Dessau (71,272 inhabitants in 1925). Other cities with their populations in 1925 are Bernburg, 34,305; Köthen, 26,595; Zerbst, 19,470; Rossau, 12,520, and Coswig, 10,103. The majority of the population adheres to the Protestant religion. The estimated revenue and expenditure for the fiscal year 1928-29 balanced at 31,540,000 marks. The public debt on Mar. 31, 1928, was 18,599,000 marks and the value of state property on that date, was 350,000,000 marks (one mark equalled \$0.2382, par value). The government under the constitution of the Free State of Anhalt dates from July 18, 1919, and by the law of Nov. 6, 1922, the administration is carried on by a ministry of state consisting of the Prime Minister or Minister-President and either one or two other ministers. As a result of the election held on May 20, 1928, the following parties were returned to the Legislature: Socialists, 15; Middle Class party, 15; Democrats, 2; Communists, 3; National Socialists, 1.

**ANIMAL DISEASES.** See **VETERINARY MEDICINE**.

**ANNAM**, ǎn-nam'. A protectorate belonging to France, forming a part of French Indo-China (see **FRENCH INDO-CHINA**). Annam's present status was established by the Treaty of Feb. 23, 1886. Area, about 39,758 square miles; population in 1927, 5,308,374, including 2654 Europeans (exclusive of military forces). Capital, Hué with a population of 4275 in 1927. Largest town Binh-Dinh, with a population of 147,199. The principal port is Tourane, from which 278 ships, with a tonnage of 934,477, cleared in 1927. The population is Annamite in the towns and along the coast, while Moi tribes inhabit the highlands. The products include cotton, rice, corn, and other cereals, the mulberry, the areca nut, cinnamon, tobacco, sugar, betel, manioc, and bamboo. The forest products include coffee, dye, medicinal plants, caoutchouc, and cardamoms. Raw silk also is produced. Probably the most important product is rice. Of the minerals, copper, zinc, coal, hematite, iron, gold, and salt are worked to some extent. Exports in 1927 totaled 88,325,936 francs, imports, 84,049,942 francs. In 1929 there were 920 preparatory, elementary, and secondary schools with a total of 50,401 pupils. The nominal head of the government is the King, but actual power is vested in the French Resident Superior. French troops are in occupation of a part of the citadel in the capital. King in 1929, Bao-Dai, who succeeded to the throne Nov. 6, 1925. During his minority, the government is in the hands of the Regency Council. A Chamber of representatives of the people was established in 1926.

**ANTARCTIC EXPLORATIONS.** See **Polar**.

**RENKARCH**

**ANTHROPOLOGY.** There was somewhat greater publication of research in 1929 than in the preceding year, especially in America, but it cannot be said that much of it was fundamentally significant. The outstanding theoretical work was the second volume of Schmidt's *Ur-*

Radin on Wappo (central California); and Wagner on Yuchi (Georgia). Most of these investigations were made among languages of the Pacific Coast States, where the greatest linguistic diversity existed. In addition, Radin studied Zapotec of southern Mexico and Dijour the Kachua of Peru. During the year 1929, much of the recording of texts and grammatical analysis was brought to a conclusion.

One stock consolidation was announced incidentally to a presentation of a "Vocabulary of the Kiowa language" (*Bull Bur Amer Ethnol*, 84), J. P. Harrington remarked that this hitherto isolated linguistic stock of Oklahoma is genetically related to Tewa, spoken in the northern pueblos of New Mexico.

**PHYSICAL ANTHROPOLOGY.** There was the usual quota of discussions of the geological age and significance of ancient semi-human types, and several announcements of new finds bearing on the descent of man. Only a few of these were to be taken seriously. The current inference that man had his origin in the Old World derives in part from the occurrence there of the only known anthropoid apes; hence, the importance of a reputed New World specimen reported by G. Montandon (*Comptes Rendu Acad Sci*, Paris, 188 815). A Kieth is convinced that the animal is nothing more than a spider monkey, perhaps of a new species (*Man*, 100).

The opinion was offered by H. F. Osborn that *Pithecanthropus* (the ape-man of Java), long regarded as of Upper Pliocene or Early Pleistocene age, actually pertains to Middle Pleistocene, a much later period. On the other hand *Eoanthropus* (Pildown man) is said to be unquestionably Upper Pliocene. Thus, the geologic age of these specimens is reversed and their significance wholly disturbed (*Science*, Feb. 22, 216). Further fragments of teeth and jaws of *Sinanthropus* of northern China were reported by D. Black (*Science*, June 28, 674), who finds the architecture of the jaw far less hominoid than the teeth, paralleling the *Eoanthropus* case. He concludes that the distinctive hominoid character of the teeth were evolved in the human family long before the jaw lost its anthropoid form.

Two petrified human brains were reported found near Moscow in association with woolly mammoth remains. They were, therefore, the oldest human brains preserved. Hindze reports that these are slightly smaller and less developed than modern human brains in the same area. A series of "Contributions to the Craniology of Central Europe" was initiated by H. L. Schapiro with a study of crania from Carinthia (*Anth Papers, Amer Mus Nat Hist*, 31, pt. 1).

An interesting survey of pathological conditions found in ancient remains by H. V. Williams (*Archives Pathol*, 7, 839) shows rickets and perhaps dental caries to have been rare in ancient times, but arthritis as common as today. Tuberculosis is demonstrable in Egypt as early as 2700 B.C., smallpox in 1250 B.C. A brief report, "Dental Pathology in Aboriginal California" was published by R. W. Leigh (*Univ. Calif. Publ. Amer. Arch. Ethn.*, 23, no. 10).

"Materials for the Study of Inheritance in Man," by F. Boas (*Columbia Univ. Cont. Anthro*, 6) was issued, being the data on which his famous study of immigration (1911) was based. It was then demonstrated that the children of immigrants developed in United States a physical type distinct from that of their parents. The

point has far-reaching importance, not only for its demonstration of the relative influences of heredity and environment, but because schemes of race classification are based on the assumption that racial types are stable whatever the environment. During 1929 L. Spier showed, although not conclusively, that similar changes have occurred in the Japanese population of the United States (*Univ. Wash. Publ. Anthro*, 3, no. 1). American-born Japanese children are distinctly taller, wider faced, and rounder headed than comparable groups in Japan.

**PREHISTORY.** The year's record in prehistory is exceptionally scanty, yet quite as much work was under way as in previous years. The most important item concerns the numerous caves northeast of Bagdad inspected by D. A. E. Garrod. In one at Larami was found a culture practically identical with the Aurignacian (Upper Paleolithic) of western Europe. The extraordinary feature is that these remains show no affinity with the contemporary Caspian industry of northern Africa, as might have been expected. Further, they are succeeded by, and grade off into, Mesolithic forms, without passing through the intermediate stages (Solutien and Magdalenian) of the West. Montevian remains of an earlier period were found in another cavern.

Recent years have seen some controversy as to whether Paleolithic remains had been found in Ireland, with conclusions in the negative. E. K. Tratman had discovered a human skeleton in Southern Ireland beneath remains of late Pleistocene animals. However, no remains of industry were found.

Continued investigations of the cultural and geological position of "Early Man in East Africa" (*Nature*, July 6, 9, Sept. 14, 413) lead L. S. B. Leakey and J. D. Solomon to redefine the situation. They outline three pluvial phases (roughly corresponding to the Pleistocene glaciations in the Northern Hemisphere) and one post-pluvial wet phase. The earliest pluvial period has associated an Acheulean culture, the second and third Mousterian and Aurignacian (cf. *Man*, July).

Reports of human remains dating from Pleistocene times continue to come from southwest United States. One of the most promising, according to W. A. Bryan, consists of human skeletons associated with Pleistocene animals in a deep bone cave at Bishop's Cap, N. M. This is not far from the finds at Folsom, N. M., which promises to be the best authenticated case for Pleistocene man in America.

Boule, Breuil, Lient, and Teilhard published a general work on *Le Paléolithique de Chine* (Paris), and de Loe, the first volume of *La Belgique Ancienne* (Brussels) summarizing the Stone Age cultures.

**OLD WORLD ETHNOGRAPHY.** No convenient summary of the writer of *Peoples of Asiatic Russia* (New York) was available in English prior to the appearance of W. Jochelson's handbook in 1929. M. A. Czapliska's special studies, published a decade previously, covered the field only in part. While Jochelson offered no new general view of their relationships, his work will undoubtedly serve as the standard guide to available data for years to come.

A succinct description of Arctic and sub-Arctic geographic conditions, prepared by W. Bogoraz (*Amer. Anth.*, 31, 579), demonstrated their importance for understanding the *Elements of the Culture of the Circumpolar Zone*. The first vol-

ume of *L'Indochine* (Paris), published under the editorship of G. Maspero, offers a survey of the primitive, as well as the cultured, peoples.

A brief account is the "Mentawai Religious Cult," by E. M. Loeb (*Univ. Calif. Publ. Amer. Arch. Ethn.*, 25, no. 2), adding on one of the ruler tribes off the Sumatra coast. Communal festivals follow a simple form of sacrifice, hepatoscopy, with intention by tabu. Dr. Loeb also published "Mentawai Myths" (*Bygd Taaliland-on Volkenkunde v. Nederlandsch-Indië*, 85). *The Races of Java* appeared from D. J. H. Nybøsen (Weltvrede, D. E. I.) dealing with the influence of geographical environment on their physique. W. Kaudein published further *Ethnographical Studies in Celebes* (Göteborg).

Several Melanesian studies appeared. B. Malinowski continued his exposition of special phases of culture in *The Sexual Life of Savages in North-Western Melanesia*. To his earlier account of their physical anthropology, F. Sarasin adds the *Ethnologie der Neu Caledonier und Loyalty-Inulaner* (Münich).

The ethnography of western Polynesia was enriched by the appearance of E. W. Gifford's voluminous report, "Tongan Society" (*Bull. Bishop Mus.*, 61). Gifford finds, contrary to older views, that there was originally no division of secular and priestly authority in Tonga, such separation being due to the supplanting of the sacred high chief by others of lesser rank. For comparison, A. Hocutt also has published his account of the Tonganized culture in the *Lau Islands, Fiji* (same series, 62). For eastern Polynesia, K. von den Steinen brought out the two later volumes of his study, *Die Marquesaner und ihre Kunst*, completing what is undoubtedly the fullest account of Oceanic art.

"A Working Classification of the Bantu Peoples of Africa," prepared by I. Schapera (*Man*, no. 63), may be compared with Herskovits' earlier culture areas of Africa. The groupings now proposed set off the peoples of the Lake Victoria region, Kenya, Tanganyika to Zambesi, Southern Rhodesia and southward, Angola to eastern Belgian Congo, and Kamerun to Kasai.

An astonishing report of P. Schebesta puts the number of pygmies in the Ituri region (Belgian Congo) at about fifty thousand. Like others, he was unable to find any pygmy language proper. P. Boesch published an account, *Les Banyamwesi* (Viremia), of central Africa.

The half-century of controversy over the Zimbabwe ruins of Southern Rhodesia since their discovery in 1868 seems adequately settled following their reexamination by G. Caton-Thompson. It has been contended that they are the ruins of an ancient Phœnician civilization of 2000 to 3000 B. C., that they were an outpost of the medieval Sabaean civilization of southern Arabia, and finally that they are of native Bantu construction, not older than the fourteenth or fifteenth century A. D. Miss Caton-Thompson endorses the stand of Randall MacIver as to their Bantu origin, finding nothing to favor the romantic Semetic hypothesis (*Nature*, Sept. 7, 390, Oct. 19, 621).

*The Manners and Customs of the Ruwala Bedouins*, by A. Muvil (New York) is a valuable monograph on the little-known central Arabians. *West African Secret Societies* was published by F. W. Butt-Thompson.

NEW WORLD ETHNOGRAPHY. An index of the growing maturity of ethnographic research in the Americas is afforded by the regularity with

which comparative studies on a continental scale are now undertaken. This was, of course, impossible until most of the local areas had been fairly thoroughly covered. K. Birket-Smith's discussion of the distribution of "Drinking Tube and Tobacco Pipe in North America" (*Ethnologische Studien*, Leipzig, 20), while not important in itself, is symptomatic. S. Linné's *Darven in the Past* (Göteborg) also is grounded in extensive comparisons.

The discovery of the Caribou Eskimo west of Hudson Bay several years before seemed to confirm the theory of Boas, Steensby, and others that the highly specialized culture of the ice-hunting Eskimo arose from just such an inland caribou-hunting people presumed to exist in this region. K. Birket-Smith now provided not only an excellent account of these people (*Rept. Fifth Thule Exped.*, Copenhagen, 5), but elaborated the theory. From a proto-Eskimo culture, now represented by the Caribou Eskimo, rose a culture adapted to the sea-ice, specialization appearing in the East and the West. The Western form was the Thule culture, known only in the central Arctic and displaced by a secondary reversion to earlier types of culture. K. Rasmussen published on the *Intellectual Culture of the Iglulik Eskimo* (same series, 7). D. Jenness suggests that the Beothuk of Newfoundland, long extinct and somewhat mysterious, formerly lived to the north in Labrador in contact with the early Eskimo (*Bull. Nat. Mus. Canada*, 56, 36).

Credit was due F. G. Speck for his continued study of remnant groups of the Atlantic seaboard. In "The Ethnology of the Pohowatan Tribes of Virginia" (*Indian Notes and Monographs*, 1, no. 5) he suggests that these Algonkians moved southward recently to the borders of the southeastern culture area, where they took over typical culture elements but gave to them a novel phrasing. They also served as transmitters of much of this culture to tribes even as far north as southern New England.

Due to the extensive dislocation of tribes in the Southern States in the period of settlement, relatively little was known of them until J. R. Swanton published his impressive study of the Creek Indians in 1928. To this he added "Social and Religious Beliefs and Usages of the Chickasaw Indians" (*44th Ann. Rept. Bur. Amer. Ethnol.*, 173). The social structure seems to have included at once a dual division, totemic clans, and local groups, the last being of greatest social importance.

While E. C. Parsons has undoubtedly made a case for "Ritual Parallels in Pueblo and Plains Cultures" (*Amer. Anth.*, 31, 642), the fact remains that many of these elements were known over far wider areas of North America. Much that is Plains is also part of Eastern Woodlands and Southeastern culture, indeed much can be matched on the southern Northwest coast. Hence, it is preferable to view Pueblo ritual as a highly specialized form of a more general North American ritual basis, with some specific parallels to such Southern Plains tribes as the Pawnee.

On theoretical grounds, it was to be expected that types of songs should be characteristic of definite regions like other elements of culture. G. Herzog has now established the area in "The Yuman Musical Style" as in Arizona-California, sharply set off from other Southwestern music, and marked by an unusual degree of stylistic

integration (*Jour of Amer Folk-Lore*, 41, 183)

Great activity continues in the archaeology of the Southwest. Investigations of "Time-Relations of Prehistoric Pottery Types in Southern Arizona," by E. F. Schmidt, indicated that the characteristic ware of the lower Salt Valley is earlier than that of the central Gila to the east and the Little Colorado to the north (*Anthro Papers, Amer Mus Nat Hist*, 30, pt 5). Successions of cultures were also reported from the ruin at Artee, N. M., by E. H. Morris, where a long occupation by a people with Chaco Cañon culture was followed after an interval by another of Mesa Verde type (same series, 26, pt 5).

The earliest of the Southwestern cultures, Basket Maker, was discovered by E. B. Renaud in a primitive form far to the northeast of the hitherto known centre in Arizona-New Mexico. Even more significant is that the rich deposits excavated in *Loclock Cave* (western Nevada) by Loud and Harrington reveal an ancient culture affiliating with that of central California and, unexpectedly, with Basket Maker. There is some suggestion of culture sequence, with the Basket Maker types earlier than the Californian (*Univ Calif Publ Amer Arch Ethn*, 25, no 1).

A distinctive contribution was made by E. M. Hawley, who by chemical analysis of "Prehistoric Pottery Pigments in the Southwest" (*Amer Anth*, 31, 730), showed that the technique of this pottery has been far more stable than the designs, which have heretofore served archaeologists as criteria of chronology. It appears that pigments of only two types were in use throughout the whole of Southwestern history, their use falling in broad areas. Roughly, the northwestern sector was set off from most of Arizona-New Mexico through the whole period, but later made inroads into the middle Gila River region. Northward extensions of the Western pottery area were made by A. H. Gayton, who reports it among the tribes of eastern-central California (*Univ Calif Publ Amer Arch Ethn*, 24, 239), and L. Schellbach in ancient sites in Idaho.

The widely varying "Petroglyphs of California" have been reduced to order by J. H. Steward (same series, 24, no 2) who finds definite areas determined by individual styles. These are eastern California with Nevada and Baja California, southwestern California, extreme southwestern California, and Arizona with Utah.

A valuable regional survey from the same area was W. D. Strong's "Aboriginal Society in Southern California" (*Univ Calif Publ Amer Arch Ethn*, 26), noteworthy for the detail obtained from these missionized peoples. An extended study, "Coiled Basketry in British Columbia," by H. K. Haeblerlin, J. A. Teit, and H. H. Roberts, under the direction of F. Boas (*1st Ann Rept Bur Amer Ethnol.*), shows that this art had its centre in the southern interior of British Columbia, spread southward on both sides of the Cascade Range, and, in Washington, westward toward the sea. F. Boas points out that certain folk-tale incidents show unexpected connections of the Southwest with the Northwest coast ("Keresan Texts," *Publ Amer Ethn Soc*, 8, pt. 1).

Studies of cultural relationships where the several factors entering into the composite are known historically, are especially valuable. R. Redfield wrote "The Material Culture of Spanish-Indian Mexico" (*Amer Anth*, 31, 602) from this viewpoint. In southern Mexico, pos-

sibly half the material traits remain pre-Columbian in type, with comparatively few combined Spanish-Indian forms, but the pre- and post-Columbian cultures are thoroughly integrated in the native mind. Similarly, R. B. Hall analyzed the secret societies, really work-groups, of the Ile à Gonave (Haiti). These seem to be bodily transplanted from Africa, with but slight French and Indian admixture, and while not assignable in origin to any particular African prototype, bear the characteristics of secret societies of that continent in general (ib., 685).

The archaeological investigations of H. W. Krieger in northeastern Santo Domingo confirm earlier reports of a pre-Arawak cave-dwelling population in the Antilles (*Bull U S Nat Mus*, 147).

Investigations in Yucatan, which in the past have been somewhat haphazard, were being co-ordinated by the Carnegie Institution of Washington under the direction of A. V. Kidder. Early in the year, a joint expedition with the Harvard Medical School was dispatched to Chichen Itza to investigate the possible relation of native disease to the downfall of Mayan civilization.

An analysis of its cultures in *Darien in the Past*, by S. Linné (Göteborg) leads to the conclusion that the routes of influence, north and south, crossed from the Atlantic to the Pacific sides in the narrow Isthmus of Panama. Cultural elements represented locally were found to have extensive distributions through Mexico, Central America, and South America.

The reputed connection of South American with Oceanic cultures, having again been raised, principally by P. Rivet, E. Nordenskiöld applies himself to the problem. A discussion of the split-drum in middle America (*Ethnographische Studien*, 17) leaves no doubt that this instrument has been invented independently in America and Melanesia. Similarly, he proves that apiculture was developed in Central, and South America independently of the Old World (*Journ Soc Amer Paris* 31, 169).

Several special studies in the South American field were made available in K. T. Preuss' work on stone monuments of the upper Magdalena River, Colombia (*Monumentale vorgeschichtliche Kunst*, G. A. Gardner's *Rock Paintings of . . . : Oñobaba, Argentina* (Oxford), and G. Montell's *Dress and Ornaments in Ancient Peru* (Göteborg). A change in designs painted on Patagonian cloaks was shown by S. K. Lothrop as possibly due to Araucanian influence from the West (*Contr Mus Amer Ind.*, 7, no 6).

EXPEDITIONS, NEWS, PERSONALIA. Activities during the year have been as full as in the past. S. Hedin visited Mongolia to make general ethnological collections for the Naturhistoriska Riksmuseet (Stockholm), accompanied by G. Montell of the Gothenburg Museum. S. Bergman was collecting in the Kuni Islands for the former. . . . where K. G. Lindblom had been appointed curator. G. Hatt left the Danish National Museum (Copenhagen) for the University of Copenhagen, K. Birket-Smith being appointed in his place. The first systematic survey of Eskimo archaeology in Greenland was begun in cooperation with this museum by T. Mathiasen. C. C. Uhlenbeck (Holland) continued his studies of Basque and Algonkian languages. The Koloniaal Instituut (Amsterdam) also enlarged its collections from the Dutch East Indies. J. P.

Kleiweg de Zwan became president of the Dutch Geographical Society.

The Staatliche Museum (Bremen) expanded its collections from Egypt, Persia, and eastern Asia, in part through the expedition of Dr. Trinkler to Chinese Turkestan. Renewed activity appeared in Leipzig on the opening of the Neues Grassmuseum (Museums für Völkerkunde). C. Nimuendaju visited the Apinayé and neighboring Gê-people of eastern Brazil for that museum and those of Hamburg and Dresden. P. Germann left for northern Siberia in cooperation with the Forschungsinstitut für Völkerkunde (Leipzig), and E. von Lückstadt concluded his expedition to the primitive peoples of southern Asia. A new Gesellschaft für Völkerkunde was founded in this city under the presidency of F. Krause, who was also responsible for the appearance of a new journal, *Ethnologische Studien*. The Staatliche Museum of Berlin dispatched H. Koenig to the Labrador Eskimo. W. Lehmann to Argentina, Bolivia, Peru, and Chile, Dr. Finsdensen to the Lapps and Crim Tartars, and an expedition to southern Angola (Portuguese West Africa). W. Kriekeberg, H. Baumann, E. Waldschmidt, and F. T. . . . ed appointments to the staff of the . . . Museum of Dresden had Herr Stotzner among the Solonen (Outer Mongolia) and Dr. Heydrich among the Spanish Basques.

The Psychoneurological Institute of Ukiaina reports continued investigations of local somatopsychology, begun in 1922 especially the effects of famine on the growth of children.

An expedition of the Museo Nazionale di Antropologia e Etnologia (Florence), under L. Cipriani, obtained facial casts and archaeological material in Natal Transvaal, and Bechuanaland, and studied the Batonga (Northern Rhodesia).

The *Anthropos* group in Vienna supported several expeditions. P. Schebesta visited the pygmies of the Ituri region (Belgian Congo), P. Vannoverbergh the negritos of Luzon (Philippines), and D. J. Wolff the Canary Islands in connection with the Guanche problem. A new centre of activity was founded as the Institut für Völkerkunde of the University of Vienna under the leadership of W. Koppers.

J. R. Mon was elected president of the Ipswich Museum in England. The Huxley Medal of the Royal Anthropological Institute was conferred on A. H. Savage.

Activities in Australia flourished under the organization effected by the Australian National Research Council several years previously. S. D. Porteus carried on psychological investigations among the natives of northwest and central Australia. A. P. Elkin completed two years' work among those of the Kimberley district (Western Australia). G. Laves studied the Kumbungui language (New South Wales), and C. W. M. Hart, the natives of Melville and Bathurst Island (North Australia). In Melanesia, R. F. Fortune investigated in the Admiralty Islands and H. Powdermaker, in Lessu, New Hebrides. R. Firth, who recently completed a year's research in Tikopia (British Solomon Islands), was appointed to the University of Sydney. F. Wood Jones accepted a professorship of anatomy at the University of Melbourne.

The Dirección de Aqueología of Mexico continued excavations at San Juan Teotihuacán and Tonayuca, beside clearing and preserving ruins found in many localities of the country.

The National Museum of Canada (Ottawa) supported investigations by D. Jenness of the Parry Sound Ojibwa, H. I. Smith among the tribes of southern British Columbia, C. Osgood of the Hare on Great Bear Lake, and the anthropometric studies of J. C. B. Grant among the Cree and Beaver of the Peace River district. M. Barbeau completed his study of the Tsimshian (British Columbia), having reached thirty tribes in his seven seasons in the field. W. J. Wintemberg traced ancient Eskimo culture of the Cape Dorset type considerably to the south of its hitherto known range on the western coast of Newfoundland.

Archaeological investigations for the Bureau of American Ethnology (Washington) took M. Stirling to Tampa Bay (Florida) and F. H. Roberts to eastern Arizona. J. R. Swanton studied the ethnology of the Choctaw (Mississippi), and J. N. B. Hewitt, that of the Iroquois (New York-Ontario). The linguistic studies of T. Michelson and J. P. Harrington bore respectively on the relations of Kickapoo to Fox, and Zuni and Keresan to Kiowa. Of the U. S. National Museum staff, W. Hough visited western Texas, H. W. Krieger the Rio Yaque, Santo Domingo, H. B. Collins St. Lawrence Islands, Alaska, for archaeology, and A. Hrdlička the Yukon River (Alaska) for physical anthropology, as well.

G. C. V. . . . med his stratigraphic study of Zacatenco (Valley of Mexico) for the American Museum of Natural History (New York), and R. L. Olson made an archaeological survey of the Southern Plains. E. H. Mearns excavated at Canyon del Muerto (Arizona) and southeastern Utah. M. Mead studied child development at Manus, Admiralty Islands (Melanesia). A joint expedition with Columbia University left for the Congo to procure specimens of gorillas, etc., for anatomical study. H. J. Spinden was appointed curator at the Brooklyn (New York) Museum. The Museum of the American Indian (New York) acquired the C. B. Moore collection of Southern archaeology. It also had E. F. Coffin in southwestern Texas on cave-excavation, with similar work by L. Schellbach in Idaho. F. G. Speck made ethnological investigations of the Nascapes of Labrador, F. Johnson of the Algonkin of Lake Barriere, Quebec, E. H. Davis of the Klamath (Oregon), and S. K. Lothrop of the Araucanians of Chile. The Field Museum of Natural History (Chicago) sent expeditions to Central America, Africa, and Mesopotamia. J. E. Thompson, who excavated three Maya sites in western British Honduras, found culture stratification. He also found the pre-Maya culture previously discovered in Guatemala. W. D. Hambly collected in Portuguese West Africa and Nigeria. A joint expedition with Oxford University, under L. C. Watelin, continued excavations at Kish (Mesopotamia). P. S. Martin was appointed in charge of North American archaeology.

The Peabody Museum (Cambridge) had H. J. Spinden studying the ruins of . . . and adjacent regions, H. B. Roberts those of Utah, and C. B. Cosgrove in west-central New Mexico. The ethnological expedition of P. T. L. Putnam visited northeastern Belgian Congo, W. Cline the Siwa and Gara Onses in the Libyan Desert and south Arabia. Anthropometric . . . extensive scale were made . . . by M. Luther, in Liberia by G. Schwab, and in Cuba by F. S. Hulse.

The Bishop Museum (Honolulu) conducted a survey of the Society and Tiamoto groups (eastern Polynesia) by K P Emory, J. F Stimson, and H L Shapiro, and of Hawaiian archaeology by W Bennett and G McAllister

The Laboratory of Anthropology at Santa Fe, N M., conducted the first extended summer school of field work in the United States. Students under A L Kroeber studied the ethnology of the Walapai (Arizona) those under E Sapir, the Navaho language, while A V Kidder conducted the section at Pecos, N M.

The University of Chicago had O Klineberg investigate the psychological differences of Negroes and Dakota Indians, R Bunzel the religion and economic life of the Zuni (New Mexico), and G Herzog, the music of the Pima, Puelho, and Navaho. The University of Pennsylvania continued its projects of an archeological survey of the State and of Algonkin ethnography. F G Speck studied the languages of Wampanag (Massachusetts), Algonkin (Quebec), and Catawba (South Carolina). V J Fewkes studied the archeology of Czechoslovakia and Pennsylvania. The anthropological work of the University of Chicago was recognized by the creation of a separate department. Their archeological survey of Illinois was continued. L Spier visited the Maricopa and Hualchidoma (Arizona), while E Sapir and G Herzog studied the Gwecho (Liberia) language. The University of Nebraska was added to those supporting anthropological work by the appointment of W D Strong. The academic part of the University of Michigan's establishment was severed from the museum. This organization had Hinsdale and Kimetz elaborating Michigan archeology and M R Gilmore ethno-botany. For Northwestern University, M J Herskovits again visited the Negroes of upper Surinam River Dutch Guiana. As usual, the University of California was active in the local field. E W Gifford among the Yuma and Yavapai (Arizona), L O'Neale the Karok, T McConno the Kawaiisu, D Demetrikopoulis and C Dnbois the Wintun, R Beals the Southern Maidu, A H Gayton the Yokuts and C D Forde the Cocopa. The University of Washington combined the State Museum with the department of anthropology under L Spier and appointed E Gunther. M Jacobs continued his linguistic studies among Molala and Kalapuya (Oregon).

**NECROLOGY.** Anthropology lost several outstanding figures of an older generation during 1929. Sir Walter Baldwin Spencer of the University of Melbourne died in Patagonia in July, aged 69. His books on the central Australian aborigines have probably been more frequently cited than any other. He was succeeded by Sir William David Dawkins, of Manchester, died Jan 15 (aged 91). While primarily a geologist, he was with Lord Avebury (Sir John Lubbock) one of the founders of European prehistory. The latter died March 26, aged 70. Dr Louis Capitan, of the Ecole d'Anthropologie de Paris, who died September 1, was responsible for some of the more precise work in French prehistory. Dr Karl von den Steinen, director of the Berlin Ethnological Museum, (died Nov 6, aged 74), was in the first rank of German ethnography. In the same country, Prof O Noffer, curator of the Staatliche Museum, Dresden, died September 12 in the United States, Stewart Culin, curator of the Brooklyn Institute died April 8 (aged 71) and Dr John M Tyler, professor of biology, Am-

herst College, died April 12 (aged 78); and in Canada, Sir Bertram Windle, professor of ethnology, University of Toronto, died February 14.

**ANTIOCH.** See LEeward ISLANDS

**ANTIOCH COLLEGE.** A nonsectarian, co-educational institution in Yellow Springs, Ohio, founded by Horace Mann in 1853. The number of students enrolled for the autumn term of 1929 was 602, of whom 456 were men and 206 were women. The faculty had 76 members. The productive funds of the institution amounted to \$255,476, and the operating income for the year was \$301,732. The library contained approximately 30,000 volumes. During 1929, 700 acres were added to the campus and several new buildings were under construction, including a science building costing approximately \$360,000, a gymnasium costing \$80,000, and a central heating and power plant costing \$135,000. Approximately \$350,000 was contributed to establish research foundations in physics, chemistry, and biology. Antioch College is conducted on the belief that academic training alone does not fit the student for life, and is based on the principle that the student divides his time between academic and professional studies at college and practical work in the professional, industrial, and commercial institutions of the Central and Eastern States. An extramural faculty supervises location of students in about 200 firms and institutions in 12 States during these working periods, which alternate with study periods in six-week intervals. President, Arthur E Morgan, D Sc.

#### ANTI-SALOON LEAGUE OF AMERICA

A federation of churches and temperance organizations in the United States, united against the beverage liquor traffic. It was established in 1895 by a coalition of the Anti-Saloon League of four States and the District of Columbia and was the outgrowth of the Anti-Saloon League movement started in Oberlin, Ohio, in 1893 by Dr Howard Hyde Russell. At the end of 1929, it embraced 49 State or Territorial Leagues and had affiliations with 40 other national temperance organizations, as well as with the World League against Alcoholism (q v). In 1929 it became affiliated with the National Association of Organizations Supporting the Eighteenth Amendment.

During 1929 the activities of the Anti-Saloon League were carried on by more than 1500 representatives and were devoted more to educational activities than to any other phase of the work. With the possible exception of the year before the submission of the Eighteenth Amendment, the league published and distributed more literature than in any other twelve months of its career. It also made wide use of the radio, moving pictures, traveling exhibits, lecturers, and posters. It organized oratorical and essay contests in the public schools, high schools, colleges and universities in which many thousands of students participated and conducted many forums in institutions of learning where it secured the authoritative presentation of both sides of the beverage liquor problem in order to insure its thoughtful consideration by students.

The official organ of the league is the *American Issue*, published in Westerville, Ohio, the monthly circulation being about 1,000,000 copies. A national edition and many State editions are published. In 1929 the periodical was reorganized, being given not merely a new format but a new character and style. The officers of the league in 1929 were: President, Bishop E Nicholson, 370

Seventh Avenue, New York City, honorary treasurer, Foster Copeland, Columbus, Ohio, comptroller and acting treasurer, H. B. Sowers, Westerville, Ohio; general superintendent, F. Scott McBride, Washington, general manager of publishing interests and of the department of education, Ernest H. Cherrington, Washington, attorney, Edward B. Dunford, Washington. The national headquarters of the Anti-Saloon League are at 30 Bliss Building and 7 Driscoll Building, Washington, D. C.

#### ANTI-SEMITISM. See Jaws

**APPENDICITIS.** False diagnosis of appendicitis and the confusion of the latter with affections of the lower chest and urinary and other organs has influenced W. K. Fraenkel of Berlin to eliminate the sensibility of the abdominal wall on the one hand and of some of the abdominal viscera on the other hand by ordinary local and conduction anesthesia and by paravertebral anesthesia. These resources may be used in an ordinary office examination since it requires but a few moments to obtain the anesthesia, and the author insists that all need of an exploratory incision or trial laparotomy may be abolished thereby. A patient subjected to abdominal palpation and deep pressure is found to be very sensitive, but after ordinary local injection and infiltration anesthesia over the appendix sensibility of the abdominal wall is inhibited and deep pressure over the appendix is no longer felt. By going further and blocking certain nerves, as the eighth dorsal and first and second lumbar, sensibility may be abolished in the gall bladder and urinary organs and affections of these structures will have no chance to pose as appendicitis. Paravertebral conduction anesthesia cuts off all communication between the spinal and sympathetic nerves and thus eliminates certain forms of sensibility which are at times attributed to appendicitis. (*Altsache Wochenschrift*, September 24)

#### APPLES. See HORRIFIC LIME

**AQUEDUCTS.** While no great aqueduct works, not previously noted in earlier Year Books, had been actively brought forward during the year 1929, the necessity for great works of this kind continued clearly to be recognized and some important trends were to be noted.

**LEGAL PROBLEMS.** The demand for increased supply in the cases of New York City and Boston led to plans being prepared for great aqueducts which would divert water from interstate streams. A new legal problem thus was brought to the fore and it became necessary to call upon the U. S. Supreme Court to clarify the interstate water rights situation in certain Eastern States. In the West, this problem had a totally different legal background based on Imperial rights and had led to the priority rights solution which was obviously inequitable and economically unsound, but nevertheless prevailed. In the East, with a riparian-rights background, the problem is new, and the decisions of the Supreme Court will vitally affect future developments.

**NEW YORK.** On April 17, Judge Charles E. Hughes and John W. Davis submitted opinions to the water-supply authorities of the city stating that the city had a legal right to take flood waters from tributaries of the Delaware River within New York State for an additional supply for Greater New York. While the Delaware is a tri-State stream and New Jersey and Pennsylvania also are interested, it was held that the

U. S. Supreme Court was unlikely to bar such diversion by New York.

Later, New Jersey brought the matter to the Supreme Court by asking for an injunction to prevent New York from going ahead with these plans, described in our previous Year Books. Pennsylvania had not taken sides on the question but asked to attend the hearing which was to take place Jan. 20, 1930. In the meantime, New York was proceeding with studies and surveys. These plans guaranteed to the Delaware the minimum flow from those tributaries which would be used for the new supply and also a four months reserve, for low-flow conditions. In other words, New York proposed to use only flood water and only part of this. This proposal was accepted by a tri-State board of commissioners but the New York Legislature alone ratified the compact. This case was likely to set a precedent as regarded the conditions under which diversions might be made from interstate streams and was thus of far-reaching importance to the eastern United States.

**BOSTON.** In reaching out westward for additional supply for the growing metropolitan district of Boston, the engineers of that city followed a natural and normal line of development, which, however, brought them into the Swift River and Ware River areas. These rivers join and are tributaries of the Connecticut, which they reach at Springfield, Mass. The War Department had given tentative approval for part of this diversion as it might possibly affect navigation in the Connecticut. The State of Connecticut, however, questioned this action and brought the problem into the Supreme Court where a hearing was scheduled for the same date which had been set for the similar Delaware River hearing noted above. The Massachusetts water-supply problem was further complicated by the necessity for apportioning available sources within the State so as not only to give Boston her needed supply but also to reserve part of available sources for the growing cities of Worcester and Springfield.

**CONSTRUCTION PROGRESS.** With the water-supply tunnel No. 2 under construction in New York City, the Mokelumne supply in California practically completed, and the Hetch Hetchy works for San Francisco nearing completion after years of labor, attention naturally turns to new projects.

**NORTH JERSEY.** The gates of the great Wanaque Dam were closed on Mar. 23, 1928, and by Mar. 4, 1929, the reservoir had been filled and water was passing over the spillway. Rapid progress has been made on the aqueduct line, which was long delayed by litigation and which would deliver water to eight North Jersey cities.

**LOS ANGELES AQUEDUCT.** The organization, under which this aqueduct (see 1928 Year Book) was to be constituted to bring water some 300 miles from the Colorado River, was extended and made permanent with the formation of the Metropolitan Water District of Southern California with a nucleus of eleven cities. While Los Angeles is by far the largest city included in the district, this gives the other interested cities a voice in this great project which it is expected will now move forward.

**PIPE-LINE CONSTRUCTION.** The *Engineering News-Record* published during the year a series of articles on the current practice in the construction of large water pipes which show clearly

the trends in large pipe design. While cast iron had been used in the past for mains up to 48 inches and over in diameter, it was clear from these articles that many engineers were limiting the use of cast iron to the smaller sizes, 20 to 24 or perhaps 30 inches and under, and were using steel and reinforced concrete for the larger diameters. In this connection, the siphons on the Yakima Project of the United States Bureau of Reclamation also were of interest. This work involves 25 siphons and reinforced concrete pipe was being used under exceptionally high heads. Steel, of course, was the only material for the higher heads, but the change from concrete to steel in the Morrison Canyon siphon on this project was not made until a head of 108 feet was reached, at Hloeshoe Canyon until a head of 135 feet was reached, and the Hayward Canyon siphon, operating under a head of 153 feet, was constructed entirely of reinforced concrete.

An extensive use of steel pipe in connection with main water-supply lines and even in distribution systems also has been noted in recent YEAR BOOKS. It is clear that economic changes, the need for aqueduct pipes of larger size and greater strength, and a growing confidence in newer forms of construction were bringing new types of pipe into this field. There will undoubtedly be further important developments in this direction in the near future. Welded pipe has, of course, continued to find new and important applications and has already become practically a standard form of construction.

**Big CREEK LINE, CALIFORNIA.** The pipe line supplying the Southern California Edison Company's hydroelectric power plant at Big Creek, Calif., is one of the most extraordinary ever built. A single pipe operating under the remarkable static head of 2418 feet supplies 540 cubic feet of water per second to two 56,000-horse-power impulse wheels. The line consists of 1855 feet of quadruple-riveted pipe varying from 108 to 84 inches in diameter and from  $\frac{9}{16}$  to  $1\frac{1}{16}$  inches in thickness, 3042 feet of forge welded pipe branded with seamless steel bands  $\frac{1}{2}$  inch on the outside and varying from 84 to 66 inches in size and from  $1\frac{1}{4}$  to  $2\frac{1}{2}$  inches in thickness, and 1764 feet of seamless forged pipe, practically all 66 inch in diameter and  $2\frac{1}{2}$  to 3 inches thick. The last type of pipe is used for the portion where the head exceeds 1642 feet.

See also WATER SUPPLY.

**ARABIA.** A peninsula in southwestern Asia situated to the south of Syria, Palestine, and Iraq and between the Red Sea and the Persian Gulf. The area is estimated at from 1,000,000 to 1,200,000 square miles, the higher figure including the Syrian Desert and the Sinaitic Peninsula. A mountain barrier, parallel to the Red Sea, runs the length of the western part of the peninsula from which the terrain slopes uniformly to the Persian Gulf, with the exception of the Oman district in the extreme southeastern section of Arabia, where a mountainous area with 10,000-foot peaks is found. Barren and sparsely watered, the peninsula nevertheless has numerous large oases. Estimates of the population range from 4,000,000 to 7,500,000, the inhabitants representing every stage of transition from the purely nomadic Bedouin tribes, occupying a large part of the interior, to the well-developed civic life of the large towns. Freed of Turkish control by the World War, the Arabs were at liberty to work out their own political destiny. After six years of

internecine warfare, the Ibn Saud dynasty of Nejd emerged as the ruling power, controlling all the peninsula except several small states along the southern coastal fringe. During this period, the divisions of the country became defined as follows:

(1) **HEJAZ or HEDJAZ.** The Kingdom of the Hejaz was an outgrowth of the World War and after a very precarious existence was compelled to submit to the domination of Abdul Aziz Ibn Saud, Wahabi leader and Sultan of Nejd, at the very end of 1925. During its rather brief career as an independent state, its frontiers were always in a state of flux, never being definitely defined except on the west. It occupies the western coast of Arabia between Trans-Jordan on the north and ASIR on the south, the latter boundary touching the coast at 20° north latitude. The estimated area of the country is about 150,000 square miles and its population variously estimated at from 800,000 to 900,000. The population is largely nomadic, although in recent years some villages have been settled where it has been possible to cultivate the soil successfully. The principal cities are Mecca, with a population of about 70,000 (this is the holy city of Islam, and attracts about 100,000 pilgrims annually, these pilgrims represent the chief source of income of the Government), Medina, also a holy city and the site of Mohammed's tomb, with a population of 20,000, and Jeddah, the seaport for Mecca, with about 30,000 inhabitants.

Agriculture in the Hejaz is not generally practicable, on account of the excessive heat, but in the oases, there are large crops, the chief one of which is dates, and in the plateau region wheat, corn, barley, millet, lentils, coffee, and tobacco are raised. Bedouin products are hides, wool, and clarified butter. The famous horses, many of which are sold abroad are raised here. The chief exports are hides, wool, and gum, the chief imports, foodstuffs and building materials. The southern section of the Hejaz Railway from Auman to Medina was put out of commission in 1925 under the régime of Ibn Saud. A new silver currency of *ryyals* was introduced in 1928 in place of the Turkish currency (1 *ryyal* equals \$0.486). The King in 1929 was Abdul Aziz Ibn Saud, with the title of King of Hejaz and Sultan of Nejd and its dependencies.

(2) **SULTANATE OF NEJD.** This state is considered the most important unit in the Arabian peninsula and occupies the highland of central Arabia between the Persian Gulf on the east and the Hejaz on the west. It is ruled by the Ibn Saud dynasty, which represents the old Wahabite empire, founded in 1745. In 1929 the population was estimated at 3,000,000. The chief products of Nejd are dates, wheat, barley, fruits, hides, wool, horses, camels, donkeys, and sheep, while the chief imports are piece goods, tea, coffee, sugar, and rice. Capital, Riyadh; reigning Sultan in 1929, Abdul Aziz Ibn Saud.

(3) **JEBEL SHAMMAR.** An emirate north of Nejd and since 1921 an integral part of the Sultanate of Nejd, by which it was captured and annexed. Population, estimated at 250,000. Capital, Hail.

(4) **ASIR.** The Province of Asir, geographically a part of Yemen, lies on the west coast between the Hejaz on the north and Yemen on the south. The estimated population is 1,000,000. Since 1920 the capital, Abha, and much of the uplands of Asir have been under control of Ibn Saud. The coastal region, which is still independent, is ruled

by the head of the Idrisi family, Seyyid Ali Muhammad, whose headquarters are at Sabiyah.

(5) **IMAMATE OF YEMEN.** An independent state about 75,000 square miles in area, occupying the Red Sea coast between Asir and the British protectorate of Aden. The population is variously estimated at from 2,000,000 to 3,000,000. The capital is Sana, with a population of about 25,000. Cereals and coffee are produced extensively. Hides form one of the chief articles of export. Ruling Imam in 1929, Yahya Mohammed Hamid ed-Din. In August, 1927, the Imam established an irregular airplane service between the seaport, Hodeidah, and Sana.

(6) **SULTANATE OF KOWEIT.** This territory, subsidized by the British, is on the northwestern coast of the Persian Gulf and has an estimated population of 50,000. Sultan in 1929, Ahmed Ibn Jabir al Subah.

In addition to the above, there are comprised within the limits of Arabia the British protectorate of Aden, the Sultanate of Oman, Hassa, and the Emirate of Katar or Trans-Jordan. See ADEN, OMAN, TRANS-JORDAN.

A considerable tract of fertile valleys lying to the east of the Aden protectorate is known as The Hadramaut. It is ruled by the rival Qa'ati and Kathiri dynasties and is under a loose British protection and control.

**HISTORY.** Raids into Iraq and Trans-Jordan by tribes under control of the Wahabi ruler, Ibn Saud, continued throughout 1929, arousing him to a number of expeditions in which he meted out drastic punishment to his unruly subjects. On January 21, Wahabis, said to be of the Ajman tribe, fired on a group of Americans traveling between Basra and Koweit and killed the Rev. Henry A. Birkerd, an American missionary at Basra. Sir Gilbert Clayton, the British High Commissioner in Iraq, stated that he did not hold Ibn Saud responsible for this and subsequent raids. It was thought probable the raiders, whose sheik had been deposed by Ibn Saud, were attempting to embroil him with the Iraq authorities.

Raids into both Iraq and Trans-Jordan were reported in March and a raid into Trans-Jordan in April was said to have resulted in the killing of 400 members of the Howateh tribe. Ibn Saud then advanced on a force of 5000 rebellious tribesmen with some 40,000 followers, according to reports, and severely defeated them, killing 750 and capturing three sheiks who led them. One of these, Ibn Ithlain, said to have caused the death of the Rev. Mr. Birkerd, was reported slain. The King then returned to the Hejaz in triumph and joined the annual pilgrimage to Mecca. In September, Ibn Saud conducted another expedition against the rebellious Sheik Faisal al-Dowish of the Mutair confederation. In November, another serious revolt under the same leader resulted in a general mobilization of Ibn Saud's forces, it was reported. The exchange of resident diplomatic representatives between the Hejaz and Great Britain was agreed upon in June. King Ibn Saud during the year extended to the Hejaz the plan, adopted with success in the Nejd, of settling Bedouin tribesmen in agricultural colonies of not less than 2000 persons each. The age-old economic system of Arabia promised to be transformed by the plan. On August 3, a treaty of friendship between Turkey and the Nejd-Hejaz was signed at Mecca.

While the Imam Yahya of Yemen continued at odds with both Great Britain and the Hejaz, it

was announced in January that he had signed a commercial treaty with Soviet Russia. Egypt, insisting that Egyptian troops should be allowed to accompany the *Mahmal* (Holy Carpet) from Cairo to Mecca, persisted in its refusal to recognize either Ibn Saud or the Imam Yahya. At a conference at Benut, regulations were adopted requiring Mohammedans making the pilgrimage to Mecca to be immunized against smallpox and cholera and to obtain certificates of good health.

**ARBITRATION.** INTERNATIONAL. The first meeting of the Tripartite Claims Commission was held on Jan. 25, 1926. The Government of the United States has been represented before the Commission throughout by Robert W. Bonyng, of New York, as its agent; he also has been serving as agent of the United States before the Mixed Claims Commission, United States and Germany, since June 16, 1923. The Government of Austria was represented by Dr. Ludwig Kleinwächter, Counselor of the Austrian Legation in Washington, as its agent until some time after the second meeting, and by Dr. Ernst Prossnigg, of Vienna, as Austrian Agent since that time. The Government of Hungary appointed John Pelenyi, Counselor of the Hungarian Legation in Washington, as its agent *ad interim* for the first few months, and he was succeeded by Dr. Alexis de Boer, who later served as Hungarian agent. Each agent has had the assistance of his own staff of counsel and clerks. Upon the suggestion of the Commissioner, acquiesced in by the three governments, the Commissioner's law clerk, Ephraim P. Bowyer, of South Dakota, in the interest of economy and efficiency, also served throughout as secretary of the Commission in lieu of the three joint secretaries contemplated by the agreement.

In addition to the 32 formal meetings held, for the announcement of rules, decisions, and opinions, the calling of the calendars of unsubmitted cases, and the hearing of arguments, the Commissioner held numerous sessions in chambers to hear the views of the agents and their counsel on particular cases or questions. The Commission sat at Washington. The agents were encouraged to submit cases on agreed statements of the facts so far as possible, and most of the claims were thus presented, which further simplified procedure and expedited their disposition. In addition to the 39 opinions and administrative decisions rendered by the Commissioner in writing, from time to time he announced numerous oral opinions for the guidance of the agents.

All of the claims submitted were presented on behalf of American nationals, none being asserted by the Government of the United States on its own behalf. Except for a comparatively small number of cases arising under the reparation provisions (Part VIII) of the treaties, the claims came under the economic clauses (Part X) of the treaties and were based on debts owing to American nationals by Austria or Hungary, or Austrian or Hungarian nationals, or on damage or injury alleged to have been inflicted in the territory of the former Austrian Empire, or the former Kingdom of Hungary. No case was presented in which the Commissioner found that the claimant had discharged the burden resting on him to prove a loss, damage, or injury proximately caused by the application, by Austria or Hungary, of exceptional war measures or measures of transfer (as those terms are employed in the treaties) to such property, rights, or in-

terests, including debts, credits, accounts, and cash assets

Claims aggregating 1631 in number were filed with the Commission through Jan 25, 1927, when the time for filing expired under the terms of the agreement. Many of these have been divided into separate cases. A considerable number of claims based on private debts, many involving comparatively large sums, were withdrawn from consideration by the Commission or dismissed because the debts had been discharged and extinguished through private settlement between claimants and debtors.

The first decisions were rendered on Mar 17, 1927, and the adjudication of all the cases presented to the Commission was completed on May 11, 1929, so far as concerned claims asserted against Austria and on Sept. 27, 1929, so far as concerned claims which were asserted against Hungary.

It was considered necessary for the Commission to continue to function for a time in order to make certificates looking to the payment of the awards and judgments against Hungary when the conditions warranting the execution thereof have been met. The records of the Commission were to be delivered to the Secretary of State of the United States in order that they may be preserved in such place as may be agreed upon by the three governments.

Edwin B. Parker, who was the War Claims Arbitrator under the Settlement of War Claims Act of 1928, died Oct 30, 1929. He had advanced the work to a point where all of the claims for the value of German vessels taken over by the United States during the World War were submitted for final determination and had laid down most of the rules governing the determination of outstanding claims. The claims for the value of the Sayville, L. J. radio station had not been submitted for decision up to the end of the year. A successor to Judge Parker had not been appointed by the end of December. There remained for decision approximately 900 cases involving about 3500 patents, most of which were on behalf of German nationals, a few on behalf of Austrian nationals and a few on behalf of Hungarian nationals.

**TACNA-ARICA.** On May 17, 1929, President Hoover announced that a settlement had been reached in the dispute between Chile and Peru over the provinces of Tacna and Arica. A treaty incorporating the terms of the settlement was signed at Lima June 3 and went into effect 30 days after the exchange of ratifications on July 28. By consent of all parties, the text of President Hoover's proposals, submitted to both governments on May 15 and immediately accepted by them as the final bases of solution, was given out by Secretary of State Henry L. Stimson, in part, as follows:

1 The territory will be divided into two parts—Tacna for Peru and Arica for Chile. The dividing line shall start at a point which shall be designated with the name "Concordia," situated ten kilometers to the north of the bridge over the River Luta, and shall continue parallel to the Arica-La Paz Railroad, following, as far as possible, the topographic features which may make easier the demarcation of the line.

The sulphur deposits of Tacna shall remain in Chilean territory, and the canals of Uchusuma and Hauri, also known as Aucarens, shall remain the property of Peru, with the understanding, however, that whenever these canals pass through Chilean territory they shall enjoy the most complete servitude in perpetuity in favor of Peru. This servitude includes the right to widen the actual canals, change their course and appropriate all

waters that may be collectible in their passage through Chilean territory.

The boundary line shall pass through the centre of La Guna Blanca, dividing it into two equal parts. Peru and Chile shall each designate an engineer and the necessary assistants to proceed to the demarcation of the new frontier in accordance with the points hereon agreed upon and shall indicate the dividing line by means of boundary monuments.

In case of disagreement, such disagreement shall be decided by a third person designated by the President of the United States, whose decision shall be final.

2 The Government of Chile will grant to the Government of Peru within 1575 meters of the Bay of Arica a wharf (malecon), a customhouse and a station for the railroad from Tacna to Arica, where Peru shall enjoy independence within the most ample free port. All the aforementioned works shall be constructed by the Government of Chile.

3 The Government of Chile will deliver to the Government of Peru the sum of \$6,000,000.

4 The Government of Chile will deliver without cost of any kind to Peru all the public works already constructed, together with all government owned real property, in the Department of Tacna.

5 The Government of Chile will maintain in the Department of Arica the franchise granted by the Government of Peru in the year 1852 to the Arica-Tacna Railroad Company.

6 The Government of Chile shall proceed to deliver the Department of Tacna thirty days after the exchange of ratifications of the treaty.

7 The Governments of Chile and Peru will respect private rights legally acquired in the territories that remain under their respective sovereignties.

8 The Governments of Chile and Peru, in order to commemorate the consolidation of their friendly relations, agree to erect on the Morro de Arica a monument, the design of which shall be the subject of agreement between the parties.

9 The children of Peruvian nationals born in Arica shall be considered as Peruvians until they attain the age of twenty-one years, at which age they shall have the right to elect their definitive nationality, and the children of Chileans born in Tacna shall enjoy the same right.

10 Chile and Peru will reciprocally release any obligation, engagement or indebtedness between the two countries, whether derived or not from the Treaty of Ancón.

A complementary protocol to the treaty, apparently intended to block Bolivia's aspirations for a corridor to the Pacific, was made public upon the exchange of ratifications on July 28. It read as follows:

1 The governments of Chile and Peru cannot under the previous agreement cede to a third power the whole or any part of the territories mentioned in the treaty of that date. The territories will remain under their respective sovereignty, and, because of this provision, it is understood that they will not construct on them new international railway lines.

2 The facilities of the port treated in Article V of the agreement gives Peru absolute freedom of transit of passengers, merchandise, and armaments to Peruvian territory and from there across Chilean territory. The embark and disembark operations, while the works indicated in Article V are being constructed, will be effected along the harbor of the Arica-La Paz Railroad.

3 The Arica port will be dismantled and the Chilean Government will construct on the coast a monument as agreed to in the treaty.

The present protocol forms an integral part of the treaty from the date and in the place where the ratifications and ratifications exchanged in Santiago, Chile, as soon as possible.

The final settlement as described came as a result of direct negotiations between Chile and Peru, fostered under the friendly auspices of the United States State Department. The only note of discord was the fact that land-locked Bolivia, a belligerent in the war that created the Tacna-Arica dispute, was ignored in the final settlement. Although President Hoover's good-will trip to South America provided the immediate and dramatic background for this willingness to settle the dispute, the foundation for accord was laid by former Secretary of State Kellogg. It was he who succeeded in bringing about the renewal of diplomatic relations between Chile and Peru after

years of disruption. The terms agreed to by the governments of the two South American countries involved were substantially those suggested by Mr Kellogg.

The territory over which these two republics had been squabbling for almost fifty years, has few natural resources of value. It is an arid region slightly larger than Massachusetts, with a population of less than 40,000. In 1922 it was decided to submit to the arbitration of the President of the United States the question of whether or not the plebiscite should be held under the Treaty of Ancón (1883). Chile favored this method of solving the problem, but Peru argued that failure to hold a plebiscite at the end of the ten-year period had nullified the provisions of the treaty. Peru further argued that the results would not be fair, since Chile had taken advantage of her occupation to colonize the provinces with Chileans and to persecute Peruvians. Three years later, the President of the United States landed down a decision, which was favorable to the Chilean contention. Due, however, to the obstructionist tactics of Chile the commission appointed to carry out the provisions of Article III of the Treaty of Ancón was unable to hold a plebiscite.

Although a minority group of Peruvians protested against the 1929 decision, the general feeling expressed throughout Chile and Peru was one of satisfaction at the conclusion of a controversy that for so many years prevented profitable commercial intercourse and friendliness. Protest was also voiced by Bolivia who in the War of the Pacific lost her seacoast as well as rich nitrate deposits in the Province of Antofagasta.

There was nothing in the original Tacna-Arica agreement to prevent Bolivia from coming to a direct agreement with either Chile or Peru for a strip of land leading to a port on the Pacific. It was found, however, during the Tacna-Arica negotiations, that there was no suitable spot for the construction of a new port in the Province of Tacna, north of Arica, and Bolivia would, therefore, have to seek its outlet through Chilean territory. The complementary protocol to the treaty appeared to block this possibility.

With the settlement of the Tacna-Arica question, Chile's last boundary was delimited. Peru, however, was still in dispute with Ecuador as to its northern boundary. In a treaty signed in Quito in 1924, Peru and Ecuador agreed that as soon as the Tacna-Arica question should be solved they would try to reach a settlement of their differences by direct negotiations, submitting to the arbitration of the President of the United States any points on which agreement could not be reached. See CHILE, PERU, and BOLIVIA, under *History*.

**ARBITRATION, LABOR.** See LABOR ARBITRATION AND CONCILIATION.

**ARCHAEOLOGY.** At Kish in Mesopotamia, the Field Museum and Oxford University continued their thorough exploration of the city site. They succeeded in reaching the virgin soil at a depth of 60 feet and as a result were able to establish by the discovery of copper objects and implements that the place was occupied as early as 3500 B.C. Among the things recovered were copper mirrors, necklaces, shells used for lamps, a stone drinking cup mounted in bronze, a spear-head, a dagger, and a toy five-horse chariot.

The finds afford an accurate chronology for the site reaching from the beginning of civilization

to the Neo-Babylonian times, as indicated by the great temple of Nabonidus which was erected at the close of the sixth century B.C. Many inscriptions were found of a date so early that no inflectional forms for verbs or nouns appear. It is thus established that the real founders of the city were a proto-Sumerian people who were also responsible for the founding of other cities in this locality. It is probable that the earliest of these settlements reach back to 4000 B.C.

In all, seven layers were found, the earliest of which contained among other things sculptures belonging to the first dynasties of Kish. From 3100-3000 seems to have been a period of decadence which was followed by the Sargonic rule.

The site of Ur continued to be a place of amazing interest. In 1929 the work was concentrated upon the necropolis and the great temple. In the necropolis, tombs of the time of Sargon (2700) were found. Of special interest was the uncovering of a royal tomb which resulted in remarkably rich finds. Part of the burial consisted of a sacrificial pit in which were discovered forty-five bodies of which thirty-nine were women. From the fact that the tomb proper suggests the form of a residence it is believed that these unfortunate victims met their death as the result of a primitive belief that life in the next world would prove to be much the same as that in this and that the prince would as in this world require in the next the service of the servants who were thus slain that their souls might accompany his into the next world.

In the burial pit were found also the remains of a chariot with two wheels and two asses. Many vases of gold, silver, and pieces with enameled flowers and other objects were recovered. It is interesting to note that the lines of the harness with its mountings of silver and lapis lazuli were still traceable. This chariot rested upon a matting under which were the bodies already alluded to. With these bodies of the women who had been slaughtered were found thirty-six headdresses quite as fine as that taken from the tomb of the princess Shubad in the previous year. Besides the many necklaces found, the excavators discovered in one corner of the pit the gold and silver mountings of the poles that supported the canopy that seems to have been raised over the victims. In another corner were found some harps which were mounted with broad bands of mosaic. One had silver mountings, inlaid with shell.

Another shaft opened contained a wooden box in which gold-handled daggers and a seal cylinder bearing the inscription "Mes-Kalam-dug the King." This person is probably a relative of Prince Mes-Kalam-dug, whose golden helmet was found in 1928. Below this find appeared a coffin burial along with which were found copper and clay vessels spread over the whole area occupied by the brick building which filled the pit. At the bottom of the shaft, which was filled with many strata containing various objects, was discovered a stone-domed chamber in which were six bodies. One was that of the owner of the tomb, the others of four men and a woman. The usual conventional funeral headdresses were found, besides rings, beads, ear-rings and an unusual, long gold pin, as well as a gold tumbler with fluted sides. The burial was that of a royal princess. Another burial found was that of a child princess in whose grave were found, besides the regulation headdresses, a miniature set of silver dishes.

Work on the site of the temple of Nannar

showed that the original building goes back to 3000 B.C. The present ziggurat is of the time of King Ur-Unger, who laid the foundations of the temple. The superstructure was completed by his son, Durgi, who also built the gateway and the chambers surrounding the courtyard. After the fall of the dynasty, work on the building was continued by Sinsinnan a King of Larsa (c. 2000). About 1400 B.C., Kuri-Galzu II of Babylon restored the temple, after which there seems to have been a cessation of reconstruction until in the seventh century Sin-balad-sukki did some work on the building. In the year 600 B.C., Nebuchadnezzar added two sanctuaries to the tower.

Among the most interesting facts emerging from the work at Kish is that the deep stratum of clay found there as well as at Ur, seems to account for the Babylonian story of the flood.

At Nihawand in Persia, Herzfeld discovered rich finds of axes, spearheads, jewelry, seals, and pins belonging to the bronze age (c. 2000 B.C.). Some relationship with Sumerian and European cultures seemed to be indicated by the pottery which shows geometric and naturalistic patterns. Some of the black and red ware appears to be like that of Egypt. Other specimens, of polished red or gray ware, resemble the ware of Anatolia.

On the coast of Northern Syria, not far from the site of Antioch, was found a subterranean passage which conducted to an underground vaulted chamber in which were found some objects of gold together with thirteenth-century pottery of Cypriot and Mycenaean manufacture. A royal necropolis was also discovered by the French expedition. It belonged to some unknown dynasty of the 13-14th century B.C. Within an area of 3000 meters were found eighty funerary deposits. Various wares in a local style, Cypriot or Mycenaean, were found. In one instance were found a number of pebbles with their equivalent weight of an Egyptian mina. Many small Egyptian objects were also recovered.

One large subterranean chamber had the floor covered with large, rectangular flags most carefully laid. Under the floor was discovered another tomb with a passage leading down to the burial chamber. Many lamps left burning in the corridor had smoked the walls. The burial had been rifled in the remote past with the result that the four bodies had been stripped of their ornaments. The finds included many Cypriot and Mycenaean vases, goblets in glass, and Egyptian alabaster jugs. In one of the tombs was an interesting ivory casket which had on the lid a seated Mycenaean goddess with a goat on either side of her which she was feeding. In richness, the finds equal those of the royal tombs at Isopata and Zafer in Crete. Not the least interesting was the discovery of a complete library of terra cotta tablets covered with cuneiform script. They appear to be of a diplomatic character. Much of the script, however, is unknown. The tablets were found in position on their shelves.

On the slopes of Mt. Carmel in Palestine, evidence of prehistoric man has been uncovered. The finds include a sort of baton carved from the shoulderblade of a deer and a figure in the round of a young deer carved on the end of a long bone. Much material of flint was found. These figures are comparable to the carvings of the Magdalenian times. At Tel Nasbeh, north of Jerusalem, the Pacific School of Religion came upon remains of the bronze age (3000-3000 B.C.). The finds throw important light on the character of pre-Semitic

inhabitants of Palestine. The remains were discovered under the floor of a limestone cave which had been buried since the days of Amos. The place has been identified as the Mizpah sanctuary of Samuel from an inscribed seal bearing the letters MZA.

At Beth Alpha, the southern part of the synagogue was entirely laid bare. The apex of the southern wall is most interesting as having served previously as a . . . the ark. A new section of the pavement south of the already uncovered pavement of the signs of the zodiac reveals a picture of the ark flanked by branched candlesticks, lulabrim, ethrogim, lions, etc. From the edge of the roof of the ark is suspended a lamp. Nearby are shown the steps leading up to the ark. Two more genii symbolizing the seasons of the year have been found. They are marked "The Season of Tebeti" (Winter) and "The Season of Tamuz" (Summer). The epigraphs of the synagogue may be of help in discovering the origin of the Jewish race.

At Jerash, the site of ancient Gerasa, Yale University and the British School of Archaeology have continued their work. Here they have found a circular church dating around 531 A.D., dedicated to St. Theodore. The building is like the round church of Buzra. In one apse was found a detailed map of the city of Alexandria. Adjoining the church to the north and the south are two others which make a connection with the common atrium. The southern church is dedicated to St. George. Although thirteen churches have been found, one is dedicated to SS. Peter and Paul.

At Shiloh, the Danes were occupied with work on the tabernacle. It was learned that a special sanctity attached to Shiloh in early Christian times. Excavations on the site of the earliest town brought to light houses of the earliest Israelite times (c. 1200 B.C.). The tabernacle still was standing at that time. Remains belonging to the Canaanite period (c. 1600 B.C.) also were found. This is the time of the Hebrew patriarchs.

In southern Palestine, Sir Flinders Petrie has identified Tell Fara with Beth-pelet of the Old Testament. Here a stone fort of the time of Vespasian has been discovered. At the south end of the town, an embankment 300 feet long and 30 feet thick protected the town from the floods which came down the gully in the rainy season. In the town itself, a palatial residence has been uncovered. It dates from Roman times. In it is a bathroom with the tub sunk in the floor. Below the Roman city was found the Greek, while the Jewish period was revealed in a building some twenty feet down in the mound. About 932 B.C. King Shishak invaded this territory and built himself a residence at Beth-pelet. Disaster seems to have swept over the place in the time of Joshua. Traces of the Hyksos rule were found on the site and evidences of connection with the Aegae.

At Beisan, ancient Bethshan, has been found a basalt tablet which offers the first clear proof of a common civilization in the East and the West before the fourteenth century. The tablet, which is in two parts was found at the southern end of the temple of Mekal. In the upper part is represented a dog fighting a lion; in the lower, a lion of Nergal, the god of the plague and death. The dog is a classical Mesopotamian creature. The lion suggests a parallel with the lion of Shekead, one of the primitive sculptures of Carchemish, and the art of Tel Halaf of Mesopotamia.

In the delta of the Nile on the western border

were discovered traces of an extensive neolithic settlement. The inhabitants of the site lived chiefly by agriculture and the raising of cattle. It is interesting to note that the burials were so disposed near the settlement that the bodies were faced toward the site as if they were considered as participating in the life of the community. This practice differs from that of Upper Egypt.

The Metropolitan Museum of Art continued its explorations on the site of Deir el Bahari. After searching in the quarry for further statues of Hatshepsut, digging was begun on the hillside north of the temple where shale chips pointed to a burial. In clearing out the ravine back of the temple, the excavators came upon an eighteenth dynasty tomb, which, it was found, had been opened three times in antiquity. The last entry was for the burial of Princess Entuiny, the daughter of Paynujem, who died before 1000 B.C. The coffin had been left hastily at the entrance to a pit well along the corridor which the bearers had been unable to cross. Beyond this pit, the excavators found the burial chamber of Princess Mery et-Amun, who was the ranking daughter of Thothmes III. Her mummy had been rifled about 1049, in the nineteenth year of the reign of Paynujem.

On the east side of the pyramid of Cheops, the expedition of the Vienna Academy uncovered the small pyramids of the royal wives. In front of them were the graves of the children. To the west lay a large cemetery 500 meters wide in which were buried other members of the royal family and other important people. Parallel to the west side of the pyramid was a long row of mastabas separated from the pyramid by a wall. This cemetery was built in the time of Mykerinus.

At Sakkarah was recovered a colossal head of the Pharaoh Usekf, the first king of the fifth dynasty. The torso had been found last year.

Work at Tel el-Amarna has been confined to the northern suburb. Here have been laid bare plans of a complete architectural unit. It is now known that this part of the town was cut through by two main roads which ran north and south. The main thoroughfares were reserved for large estates with the small properties and craftsmen sandwiched in between. In the house were found objects connected with every sphere of life.

In the island of Cyprus has been discovered a torso of Septimius Severus. It was found near Nicosia. This year, the Swedes concentrated on the excavations on the site of the palace at Vouli. Tombs of the archaic and classical periods were also explored. It has been found that the palace was built about 500 B.C. and abandoned about 400 B.C. when it seems to have been partly destroyed by fire. The building is quite unusual as an example of secular architecture. The building covers nearly 10,000 square yards, although only the walls of the lower story are left. The upper part of the structure was of sun-dried brick and rested upon the well squared blocks of the ground story. The floors were made of a kind of concrete composed of sand, gravel, and lime.

Some idea of the size of the original structure can be obtained from the fact that the ground plan shows over one hundred rooms. In the centre of the building was a central court three sides of which were surrounded by a covered portico. A grand staircase extending over the whole width of the court led up to a reception hall about 24 by 62 feet. Its proportions are therefore about the same as those of Mycenaean palaces. To the south

of the main rooms are the kitchen quarters and a series of magazines opening on to another large court.

At the Dipylon Gate in Athens, the German Archaeological Institute conducted excavations which have produced interesting results. Sixteen feet of the debris which filled in the area between the gate and the sacred way have been removed. Here were found many jars which indicate that a granary occupied this site. Graves dating about 1000 B.C. were also discovered.

The chief object of the American excavations at Corinth was the clearing of the theatre. The central part of the cavea, as high as the eighth stairway, was freed of dirt. On one seat was found scratched "Nika, Nika, Nika" (Conquer, conquer, conquer), in another a carefully cut inscription "of a girl" implying that the latter part was in the fourth century B.C. reserved for girls. Near the surface of the area were found many archaic terra cotta which seem to be a dump of votive objects cast out in antiquity. Behind the stage a large rectangular area was discovered. It was paved with marble and was probably surrounded by a stoa.

From the sea, near Cape Aitemesios at the north end of Euboea, has been recovered a bronze Poseidon or Zeus, a large amphora, a bronze head of a horse, and the figure of a child of the Hellenistic period.

At Aquileia, near the Gulf of Trieste, many house mosaic pavements were found. The draining of the lagoon near Comacino revealed a cemetery dating from the fifth to the fourth century B.C. The majority of the 460 tombs so far opened date on the fourth. At Gioiosa Ionica on the coast of Calabria, the excavation of the theatre brought to light the use of terra cotta jars as amplifiers of sound. This is the first time that this device mentioned by Vitruvius had been found. Excavations at Herculaneum were concentrated on the second street of the "Decumanus Minor." In one house was found a wooden partition perfectly preserved in a carbonized state. The iron fittings and copper nails were almost as if new. In another house were recovered fine frescoes splendidly preserved. One of them showed Venus with a bull. In still another house was found a life-sized bronze bust which seems to be that of the tutelary deity of the house.

The lowering of the lake of Ledro for certain hydroelectric works brought to light the most extensive pile-dwelling settlement in Italy. The part exposed is over 2000 square yards in area and shows over 1000 piles of larch and chestnut. Stone implements, rough, handmade, and polished ware and vessels with and without inscriptions were discovered. Work still goes on at Lake Nem. It has now been found that the bulk of the uncovered barge was divided by bulkheads into watertight compartments. There is also evidence that there was once a superstructure something like that of a modern ocean liner. The second ship lies about 200 yards to the south of the first. The first is 107½ feet long by 60 wide, the second 233 by 80.

The chief discoveries this year at Ostia have been made in the centre of the town. In the centre of the forum facing the temple of Vulcan were found the remains of a temple to Rome and Augustus. In it was a statue of Roma Domitiana and a statue of Victory offering the goddess a crown of laurel.

Excavations on the site of the temple of Rome

and Augustus at Pola show from inscriptions that the temple was dedicated 2-14 A.D. At Pompeii, the latest excavations have been in the Via dell' Abondanza. In the commercial quarter in the upper part of the street, two- and three-story houses have been uncovered. This is where the merchants and bankers had their homes and offices. Here also were found factories, shops, and taverns, occupying both sides of the streets.

On the side of the Alban Mountain, a well-preserved bit of Roman road was cleared. On the Via Flaminia was found an interesting rock-cut tomb with paintings in the early Christian style. In the city of Rome itself, excavations in the Largo Agostini have been vigorously carried on. Here is found what may be a head of the goddess Bellona. The demolition of the Via Sacra has revealed the existing stone building of the second century A.D. in the west bay of the Forum of Trajan.

Near Granttham in Lincolnshire, England, the hypocaust of a Roman villa was excavated. At Lydney in Gloucestershire was discovered an iron mine underlying post-Roman earthworks. The marks of the picks of the Roman miners were still to be seen. In Hampshire at North Wainborough, excavations revealed a furnace chamber and flues for heating the floors of a villa. Near Norwich, the site of Caistor Camp (the Venta Icenorum of the ninth century of Antoninus (c. 320) A.D.) was perfectly revealed in aerial photographs. Excavations traced the walls of twin temples. Coins of Faustina Valens or Valentinian, a bone pin, a weaving weight, two bronze rings, a house key, and the head of a bronze eagle were discovered.

**ARCHITECTS, THE AMERICAN INSTITUTE OF** The national organization of the American architectural profession, founded in 1857. Its objects are to organize and unite in fellowship the architects of the United States, to combine their efforts so as to promote the aesthetic, scientific, and practical efficiency of the profession and to make it of ever-increasing service to society, and to spread an understanding of art and service among the people. Its activities include devising methods for improving and extending architectural education, not only in the universities but in the lower schools, securing proper laws for the registration of architects in the various States, developing a service for architects which will give them for their actual problems data relative to building materials and methods obtainable from no other source, maintaining a public information service to tell the prospective builder the financial, as well as the aesthetic, service of the architect.

The institute is governed by officers and a board of directors elected by, and responsible to, the delegates from the 64 chapters assembled at the annual convention. The directors and executive committee hold quarterly meetings in various parts of the country, and the regional directors keep in active touch with the work of local chapters throughout the year. The membership in 1929 numbered more than 3000 of the 10,000 practicing architects in the United States.

The sixty-second annual convention, held April 23-25 in Washington and April 26 in New York City, was dedicated to the National Capital and Its Development. Various speakers cited the progress made by the institute in its extended efforts to effect measures to insure the future beauty and greatness of Washington along lines conceived by L'Enfant, Washington, and Jefferson. Among the

projects urged was the passage of the Cramton Bill, providing that the Treasury lend \$16,000,000, without interest, for the purchase of park lands within the District of Columbia. In addition to the foregoing, the bill authorized an appropriation of \$7,000,000 for the outer park system, for the purchase of lands along the Potomac River, for the development of the boulevards from Great Falls to Mt. Vernon and Fort Washington, for the extension of the Rock Creek Park system, and for other outlying lands which it seemed desirable to acquire before any destruction took place.

The control of private building within Washington to prevent the inharmonious development of the national capital also was advocated, the board of directors urging the passage of the Shipstead-Luce Bill for the regulation of the height and exterior design and construction of private and semi-public buildings in certain areas of the capital. Local chapters were asked to continue their efforts to arouse public opinion to the need of the proper development of Washington.

In the report of the committee on education, an extension of adult education to free members of the profession from the narrowing tendencies of their intense business activities was demanded. A warning also was issued as to the nature of many so-called courses in architecture given in trade and high schools, which were misleading and called for the drawing of a definite line between the purely vocational and the professional. In addition to the reports of the various committees, the following lectures were given: "Long-range Planning of Public Works," by William T. Foster, "Architectural Leadership from the Producer's Standpoint," by Thomas D'A. Brophy, "Architecture," by Charles Evans.

The Architect in the Small Community," by Nat G. Walker, "The Architect and His Opportunity—A Layman's View," by Frederick Paul Keppel, "Street Traffic and the Office Building," by Miller McClintock, "The Plan of Washington," by Horace W. Peaslee, "Public Works," by Milton B. Medary, and "The Harmonious Development of the National Capital," by Col. Ulysses S. Grant, 3d, U. S. A. The gold medal of the institute was awarded to Milton B. Medary for distinguished achievement in architecture, the fine arts medal, to Diego Rivera for distinguished achievement in painting, and the craftsmanship medal, to Cheney Brothers for distinguished achievement in textiles. The following were made honorary corresponding members: William Symes Richardson, an American living in Rome, Raymond Unwin of London, Charles Lethbride of Paris, Alejandro Christophersen of Buenos Aires, Paul Bonatz of Stuttgart, Fritz Schmucker of Hamburg, Paul Leon of Paris, and Howard M. Robertson of London, while eight honorary members were announced.

The endowment fund capital of the institute in 1929 amounted to approximately \$75,000, the income being devoted to the maintenance of the Octagon House in Washington. The organization's property and funds totaled \$428,823, of which \$52,385 belonged to the Waid Education Fund, the income being used to defray expenses of lectures sent to various States and to preparatory schools. The institute publishes the *Octagon*, a *Journal of the American Institute of Architects*, *Handbook on Architectural Practice*, *Structural Service Book*, *The Significance of the Fine Arts*, *Standard Contract Forms*, which are

in widespread use throughout the United States, and documents on the ethics of the profession Headquarters are in the Octagon, Washington

**ARCHITECTURE. UNITED STATES.** Two definite trends were evident in the year's American architecture. The first, in connection with buildings of a public character, was the continuity of traditional conceptions, either classic or medieval, as the case may be, with details becoming continually freer and more imaginative. The second was the tendency in almost all buildings of a commercial or industrial type to become increasingly modernist. Domestic work was still without any ruling lines of development; modernist influences, the historical styles, local types and traditions all modify house design in varying proportions.

The first tendency is well illustrated in the Hartford County Building, Hartford, Conn., by Paul Cret and Smith & Bassett, Associated. This is distinctly Greek in feeling, delicate yet monumental, but every detail is non-archaeological and shows a distinct modern French influence. The Cook County Court House in Chicago, by E. E. Hall of Hall, Lawrence & Ratchelle, Inc., is likewise in a classic style with modern details. More Roman than Greek, it gains monumental effect by a colonnade of great scale with statues against the attic, over the columns, modeled by Peter Toneman. The Civil Courts Building in St. Louis, designed by the Plaza Commission, which is crowned by a colonnade and a pyramidal top, has detail of a more archaeological type, but the whole composition reveals the same attempt to interpret classic traditions in a twentieth-century manner. The Caddo Parish Court House, Shreveport, La., by Edward F. Neill, is a monumental building in modernized classic, which well realizes the competition drawings. The designs for the United States Embassy at Tokyo, by H. van Buren Magoon and A. Raymond, Associated, shows the same freedom applied to the Italian Renaissance. It is an interesting group of a chancery at the street entrance, employees' residences and offices on either side behind, and at the top of a hill, closing the main axis, the ambassador's residence. It is significant and encouraging to see such an adequate and beautiful plan adopted for an embassy of the United States.

The Bok Singing Tower in Florida, by the late Milton B. Medary, with sculpture by Lee Lawrie, treats a Gothic tradition with equal freedom. Its simple upward sweep is magnificent. The belfry openings are filled with polychrome faience gilles, and the whole is capped with an openwork balustrade of conventionalized foliage and birds.

The modernist tendency in commercial buildings appears in its most bizarre forms in the Union Trust Building in Detroit, by Smith, Hinchman & Grylls. Not only are all the forms new, with a great use of stepped shapes, but also the whole blazes with color, practically all of the detail being of colored terra cotta, orange, black, white and gold for the upper portions, and green, buff, cream, orange red, and blue below. The treatment of vertical breaks gives beautiful vertical shadows. The same stepped forms that are used outside control the interior detail and the whole constitutes a building of power, interest, charm, and significance. The Chicago Daily News Building and the office building at 333 North Michigan Avenue, Chicago, both by Holabird & Root, are full of a more quiet, structural, and logical modernism. The Daily News Building is chiefly

impressive because of the effective use of terraced setbacks on the river front and the strong composition of the piers and windows above. In New York, the Fuller Building, by Walker & Gilette, has an interesting top of black and white, but the composition is absolutely cut in two where the base of black marble and glass gives way to the white brick above. The most effective of the New York modernist skyscrapers is the Lefcourt National Building, by Shreve & Lamb, which makes stunning use of setbacks and vertical breaks. The success of its white brick tower shows the desirability of pure white as a color for the smoky New York atmosphere.

Other important high buildings in New York are the Arnold Constable Building, by Ludlow & Peabody, with a graceful outline and refined Renaissance detail, and the much discussed, pretentious and over-elaborate New York Central Building by Warren & Wetmore.

Outside of New York, the Smith Young Building at San Antonio, Tex., by Atlee & Robert Ayres, is a polygonal Gothic tower, the Northern Life Tower at Seattle, Washington, by Albertson & Wilson and Paul Richardson, Associated, has well proportioned setbacks and a beautiful brick texture, and the Fidelity Philadelphia Trust Co., in Philadelphia, by Simon & Simon, is remarkable because of its lower portions, which are designed in an Italian Renaissance style of great scale and unusual power.

The race to build the highest building in the world between the Bank of the Manhattan Co., by H. Craig Severance and Yasuo Matsui, Associated, and the Chrysler Building, by William Van Allen, both in New York and both under construction at the end of 1929, after much *opera bouffe* secrecy, was won by the Chrysler Building by means of the simple expedient of substituting a framed *flèche* for the flag pole originally planned. The futility of such publicity-seeking efforts could not be better exposed, and the whole mad race to develop congestion and to erect buildings without regard for street areas and transit facilities can eventually lead only to bankruptcy or disaster—half-empty buildings of street and transit congestion unbelievable and indecent.

There were many interesting smaller commercial buildings. The Canal Street Branch of the National City Bank, New York, by Walker & Gilette, is in a simple modernist classic, as is also the American Bank & Trust Co. of Philadelphia, by William Pope Barney. The Integrity Trust Company in Philadelphia, by Paul Cret, uses metal, marble, and glass in a fresh manner. The First Trust Company, Holmesburg, Pa., by H. H. Burr and Burney, is simple and colonial. Grace Nicholson's Treasure House, Pasadena, Calif., by Marston, Van Pelt & Maybury, is a delightful and amusing American interpretation of southern Chinese precedent, with just the right fairyland character for an oriental shop.

In New York, the Stewart Building, by Warren & Wetmore, has a distinguished and beautiful use of simple stone work in the walls and proportions that are subtle and effective. The whole has "style," but the metal work of the main entrance is confused, frivolous, and entirely out of character with the rest of the building. Ralph B. Benker, in Philadelphia, designed several original and charming branch buildings for Horn & Hardart, and in Chicago the Baskin Building, by Holabird & Root, is a slim and delicate composition of great *chic*.

Among industrial buildings, the warehouses for Sears Roebuck in Milwaukee, Wis and Cambridge, Mass., by Nimmmons, Carr & Wright, stand out in their bold composition, magnificent massing, and simple, straightforward detail. The printing plant for the Los Angeles Down Town Shopping News, by Morgan, Wells & Clement, is rich, with slim vertical lines and a lavish frieze at the top, in an interesting modernist interpretation of Spanish baroque, for which this firm is famous. The Philadelphia Wholesale Drug Co Building, by Rankin & Kellogg, is utterly simple but effective in its proportions; the Plaza Sub-Station of the Union Electric Light & Power Co of St. Louis, by La Baume & Klein, has a rich street facade in a powerful early Italian Renaissance style. A new addition to the Bamberger department store in Newark, N. J., by Jarvis Hunt, has a picturesque mass.

Theatres, as usual, fall into two classes, those in which extreme lavishness of materials, often with little or no composition, is used to give an effect of gaiety, and the so-called "atmospheric variety," with all sorts of stylized forms of fairy tale character. The Pickwick Theatre of Park Ridge, Ill., by McCaughey & Zook, and the new Paramount Theatre in Brooklyn, by Rapp & Rapp, belong to the first class, the Netoco Theatre in Boston, by Eisenberg & Ficer, is of the second, in a wild and amusing ancient Egyptian style, the Alhambra Theatre at Sacramento, by Starks & Flanders, uses a fantastic and delicate Spanish-Moorish style. The Convention Hall in Atlantic City, by Lockwood Greene & Co and Cook & Blount, Associated, is an enormous curved-roof structure, comprising an exhibition hall and a vast auditorium, the facade toward the board walk is decorated with an arcade.

The most remarkable church of the year is the Boston Avenue Methodist Episcopal Church, South, Tulsa, Okla. by Rush, Endicott & Rush, Bruce Goff, and Miss Adah Robinson. It is an astonishing and daring composition of forms imaginative and fresh, in which vertical lines predominate, there is an effective, slim tower and great richness of detail around the entrance. The interior is less significant. The Glencoe Temple, Glencoe, Ill., by Alfred S. Altshuler, is a simple and charming synagogue with modernist detail and a lovely use of brick surfaces.

Of the more conventional ecclesiastical buildings, the most impressive is the Church of the Heavenly Rest and the Beloved Disciple, New York, by Mayes, Murray & Philip (formerly the Goodhue Associates), an exquisite work in that rich and free Gothic, much modernized, which is a logical development from the work of Bertram G. Goodhue. Particularly effective is the use of great plain surfaces of stone contrasted with small areas of delicate tracery that solve so well the problem of the scale of a city church. The Hilton Memorial Chapel, of the Chicago Theological Seminary, by Herbert Hugh Riddle, is a small and delicately detailed, timber-ceiled building in English Perpendicular. In Chattanooga, Tenn., the Ochs Memorial Temple, by Bearden & Crutchfield and H. B. Herts, Associated, is a synagogue unusual in being a beautiful interpretation of the colonial style. Temple Emanu-El, New York, by Kohn, Butler & Stein is the largest and most lavish synagogue of the year—a beautifully composed and freshly detailed building in a modified Romanesque style, with a magnificent, polychromed, open-trussed ceiling.

The largest American hotel of the year, said to be the largest in the world, is the New Yorker, in New York, by Sugarman & Berger. It is a vast pile in gray brown brick, with an effective use of setbacks. The Hotel Lexington, New York, by Schultz & Weaver, is a picturesque mass with over elaborate detail in the Tudor manner, the Hotel Governor Clinton, New York, by Murgatroyd & Ogden, is a picturesque, towered, mass, and the Molly Pitcher Hotel at Red Bank, N. J., by N. Harris and Harris & Sohn, represents the best type of conventional, rural colonial hotel. "Mir-algo," in No Man's Land, Ill. (near Chicago), is a delightfully unconventional and frivolous inn and road house, by G. F. Keck. Not meant to be serious, it is vivid, fantastic, occasionally garish, but always amusing. Although not in the United States, the Royal York Hotel in Toronto, Canada, by Ross & Macdonald and Sproatt & Rolph, Associated, is a hotel of purely American type, elegant, monumentally classic, with tall, setback wings.

Clubs worthy of note are The Shawnee Club, Wilmette, Ill., by Burnham Bros., a simple building of stone and half timber, the Casino Club in Chicago, by Graziop & Raftery, especially on account of its circular hall room, with tall, slim columns, and the San Clemente Beach Club, San Clemente, Calif., by V. Westbrook. A notable example of the typical southern plantation style in stucco and tile. The new Tammany Hall Building in New York, by Thompson, Holmes & Converse, is a dignified and monumental structure in a formal colonial combination of brick and stone.

At the University of Wisconsin, Madison, Wis., a new Memorial Union Building, by Arthur Peabody, combines, in a whole both monumental and yet intimate and inviting, an enormous common room, cafeteria, several dining rooms and the Alumni Hall. The Italian Renaissance style is handled with feeling and delicacy. It was opened late in 1928. The University School for Boys, Cleveland, Ohio, by Walker & Weeks, is characteristic of a type that is becoming continually more common, the suburban country day school. The buildings are in an austere colonial style with a high, slim tower. The Brearley School, New York, by B. W. Morris, is an interesting attempt to adapt a riverside site of several levels, and a strictly urban modernist style of uncompromising rectangularity, to school uses. A more intimate solution of the city-school problem has been achieved by R. H. Dana, Jr., in the Dalton School, New York, noteworthy for its unconventional plan and the charming variety of its interiors. The Castle School, New Rochelle, N. Y., by McGill & Hamlin, is in a much modernized colonial style.

A large amount of apartment-house building all over the country, particularly in the higher-priced class, remained generally absolutely conservative, real estate operators are not experimental. The outstanding exception is the Beaux Arts Apartments, New York, by Kenneth Murchison and Raymond Hood, Godley & Foulhoux, Associated. This shows a strong desire to follow purely European influences, particularly those of Mendelssohn in Germany and Le Corbusier in France. It has many setbacks and a simple treatment of alternate bands of white stucco and brick and steel sash. Corner windows of steel are used effectively in the Roetich Museum and Master Apartment Building, by Corbett, Harrison & Macmurray, and Sugarman & Berger, Associated,

THE CHRYSLER BUILDING  
NEW YORK CITY  
WILLIAM VAN ALLEN, ARCHITECT

THE UNION TRUST BUILDING  
DETROIT  
SMITH, HINCHMAN & GRYLLS, ARCHITECTS

AMERICAN TOWER BUILDINGS OF 1929

with an interesting use of brick in graded colors.

Excellent domestic work was produced by Julius Gregory, Delano & Aldrich, and F. J. Forster, near New York, by H. T. Keyes, and R. F. Swanson, near Detroit, by Miller & Reeves of Columbus, Ohio, by L. Dahling, near Philadelphia; by Bogner & Billings in New England, and by Marston, Van Pelt & Maybury in southern California. Especially interesting houses are those of Charles W. Oliver, Houston, Tex., designed by the owner, in a freely interpreted Spanish style, of W. A. Knight, at Baltimore Forest, N. C., by W. W. Dodge, Jr., a picturesque composition in local stone with a conical tower, of Garrett Van Pelt in Pasadena, Calif., designed by the owner in a particularly winning, modernized Gothic, the hunting lodge of Col. H. H. Rogers, by the office of John Russell Pope, a large and meandering composition in a simple farm house colonial style, the Anchincloss house in Fairfield, Conn., by Roger H. Bullard, a dignified and formal colonial mansion, and Meridian House, Washington, D. C., by the office of John Russell Pope, in a palatial, yet restrained interpretation of the Louis XIV manner.

The most significant and encouraging event in the year's housing was the completion of the first portion of Radburn, N. J., by Clarence Stein and Henry Wright, and Robert Kohn, consulting architect. This is the most carefully thought out community plan which has yet been produced in America, for the first time, the automobile has been considered, not only as a traffic element, but as an integral part of the necessary surroundings. Paths, passing under roads, have been so arranged that it is possible to get anywhere in the development without crossing a road, and roads themselves have been minimized. The resultant increase in parked areas adds enormously to the charm of the whole. The individual houses are simple and dignified, in a modified and modernized English style. Each house has its own garage.

**GREAT BRITAIN** The outstanding public building of the year in England was the Royal Horticultural Hall, by Easton and Robertson, significant in the frank expression of its structure, especially imposing is the interior with its great but delicately detailed parabolic, concrete arches. The stepped outline of the exterior, although perfectly expressive of the internal design, is less effective. Quite different in character is the extremely classic Nottingham Exchange Building, by T. Cecil Howitt, which is also the home of the Nottingham Council. This building shows obviously the influence of the American State Capitol type, its dignified colonnades are beautifully detailed, but the crowning dome could have been larger. The interiors are the best part of the whole, uniformly simple, dignified, and lavish.

The Northeast Coast Exhibition buildings at Newcastle-on-Tyne, by W. and T. R. Milburn, with Richardson & Gill consultants, was in a charmingly modernized, simplified classic style. The festival hall with an Ionic colonnade at the entrance and the palace of arts were particularly noteworthy. The Bournemouth Pavilion, by Home & Knight, with Sir E. Owen Williams as consulting engineer, combines a concert hall, ballroom, tea room, and restaurant into a plan of great cleverness. The Manchester Masonic Hall, by Thomas Worthington & Sons, obtains definite monumental effect in a modified classic manner.

A great deal of commercial building distin-

guished the year, especially in London. Much of it is in the usual rather complicated Renaissance, which has become almost the typical London style, such as Beaver House, by Williams & Cox, Royal Mail House, by Sir Edwin Cooper, and the River Plate House, by the Messrs. Josef Lloyds Bank, by Sir John Burnet & Partners, and Campbell Jones, Sons & Smithers, as befits its situation near the Mansion House, interprets the same late Renaissance style in twentieth-century terms, it is strong, monumental. Somewhat similar in style, the Imperial Chemical House in London, by Sir Frank Barnes and Alfred Cox, Associated, is even more successful. It avoids the dangers of complexity and incoherence, too common in London, and its tremendous street frontages allow unusual monumental magnificence. The simplicity of the wall and window treatment is beautiful, a colonnade forms a frieze at the top, and the reveals are deep enough to give the amount of shadow that such a powerful conception demands.

The central offices of the London Underground, by Adams, Holden & Pearson, form a whole as distinguished, but based on an entirely different psychology, the attempt to achieve classic dignity with forms absolutely modern. Its effect is due to the careful design of setback wings buttressing a central tower, and shows that the beauty of certain American skyscrapers is due less to brute height than to easily grasped form relationships. Even more unconventional is the Radiator Building, by Gordon Jeeves and Raymond Hood, Associated, the exterior designs of which were almost entirely produced in America in the office of Raymond Hood. The whole exterior is in polished black granite enlivened by a polychrome frieze and polychrome ornament around show windows and door of modernist type, predominantly orange and gold and largely in enameled bronze—a daring but successful experiment.

Outside of London, Atkwright House at Manchester, an office building, by Harry S. Fairhurst, has a dignified, classic front, and the new offices at Bellingham for the Imperial Chemical Industries, Ltd., and Synthetic Ammonia and Nitrates, Ltd., by L. H. Bucknell, is noteworthy for its use of brick and stone and tile roof to achieve a semirural charm in tone with its surroundings. The buildings of the Air Park at Heston, by L. Magnus Austin, use the simplest forms expressive of reinforced concrete construction in a serious attempt to solve the problem of the necessary buildings for a small airport.

Unusually charming for an industrial building is the Windmill Press for William Henman, Ltd., at Kingwood, Surrey, by Lord Gerald Wellesley and Trenwith Wills, which is in a delicate Georgian style, full of individuality. Its setting in carefully designed planting adds much to its effect. The Firestone Factory at Houndslow, by Wallis, Gilbert & Partners, is a more conventional factory but shows a commendable effort to make working surroundings beautiful.

Ecclesiastical architecture is well represented by the First Chubland Church in Walsworth, London, by Edward Maufe, which is typical of the modern English trend toward free church design. The Seventh Church of Christ, Scientist, by Paul Phipps, like all English Christian Science churches, is dominantly an auditorium, simply designed in a free style with little precedent. St. Anselm's Church at Hayes, Middlesex, by

Hubert C. Corlette, is a modern interpretation of Gothic, and the new Memorial Chapel at Glasgow University, by John Burnett, Son & Dick, is a beautiful example of almost purely archaeological Early English style. The new chapel of Stowe School, by the late Sir Robert Lorimer, is a long narrow building of great charm, its style determined by the columns which were taken from an old Georgian garden temple on the site, and which form the entrance porch.

The most important educational work of the year is the new quadrangle at Clare College, Cambridge by Sir G. G. Scott, consisting of simple two-story buildings distinguished in their austere elegance, rather Georgian in character. Younger Hall at St. Andrews, Edinburgh, designed several years ago by the late Paul Waterhouse, was completed by his son, Michael Waterhouse. In Liverpool, a dignified building for the School of Geology, by Biggs & Thornley, a memorial to Lady Herdman, was added to the University, and the Liverpool College completed a charming brick wing with cloisters, by Leathart, Granger & Webber. The London School of Tropical Medicine, by Rees, Morley & Horder, associated, is a square and simple building entirely in harmony with its Bloomsbury surroundings. Of secondary schools, that by G. Topham Forrest, at Brockley, retains the high standard in simple brick building of the London County Council work. The Wyggeston Grammar School for Girls at Leicester, by Symington & Prince, is characteristic of the smaller English schools. The William Booth Memorial Buildings, in Denmark Hill, London, by Gordon & Viner and Sir G. G. Scott, is an impressive group for a Salvation Army training college.

Of many theatres, the Dominion Theatre in London, by W. and T. R. Milburn, seats almost 3000 people and is lavishly decorated in French Renaissance style. Interesting moving-picture theatres are the Twickenham Cinema, by Leathart & Granger and one at Beaconsfield, by the same architects.

The most important domestic work is undoubtedly in the Larkhall Estate at Clapham, by de Soissons & Worrum, which consists of blocks of simple neo-Georgian apartments, carefully placed in garden surroundings. Noteworthy also is "Finella," an ultra modernist house in Cambridge, by Raymond McGrath, with the most lavish and imaginative interiors, and an equally unconventional house at Newbury by Thomas Tait, of Sir John Bunnet & Partners.

FRANCE. The Central Market at Rheims, by E. Maigrot, has beautiful hyperbolic vaulting with skylights following the curve of the vault. A somewhat similar form distinguishes the machine shop of the Cie Fémic at Vichy, by A. Deville. The new stadium at Boulogne, near Paris, by Remaury, Lambert, Saacke, & Bailly, is effective in its use of great concrete cantilever trusses over the grandstand. All three of these buildings reveal the artistic possibilities of concrete. The Palais de Méditerranée, at Nice, by Charles and Marcel Dalmas (the new casino built by Frank Gould), is a neo-classic work with modernist interiors, brilliantly planned and lavish to the point of ostentation. A similar spirit distinguishes the Restaurant le Berry in Paris, by Louis Grossard. The railroad station at Lens, by M. U. Cassan, is most successful in its practical requirements such as switch towers and telegraph wire standards. The rest is in a sort of pedestrian

modernism. In Algiers a war memorial by Maurice Gras and E. Monestes, with sculpture by Landowski and Bigonet, is an impressive combination of steps, flanking walls and central group. The monument to the Lafayette Escadrille, near Paris (dedicated in 1928), by A. Marcel, with sculpture by M. Renard, has a simple, triumphal arch flanked with modernized colonnades. It is elegant rather than impressive.

The most interesting of the French churches, extremely radical in design, is that at Elizabethville, by P. Tournon, with sculpture carved in the concrete by S. Bezolles. The entire façade is carved and the whole is a significant attempt to treat a form generally Gothic in shapes that express its concrete construction. The Maison Japonaise is the newest addition to the Cité Universitaire in Paris, by Pierre Sédou, and successfully attempts to reincarnate some of the Japanese spirit, particularly in its roofs. Its interiors are especially good. The Institute d'Histologie at Strasbourg, by R. Dumas, has charming and delicate masonry, especially in its stairs.

The most extreme modernism seems to control the greater amount of domestic building and many of the new Paris apartment houses, such as that on the Avenue Percier, by C. Percier, in which there is an interesting large court whose walls have huge glass areas and horizontal bands broken up by boldly projecting buttresses. The Théâtre St. Georges, by L. Sullivan, in Paris, shows a similar radical and austere modernism applied to a small, intimate theatre. A like spirit appears in the sanatorium at Plaine-Joux-Mont Blanc in Passy, Haute Savoie, by Abraham & Le Mène, an extraordinary rectangular group with many balconies. The opposite extreme is to be seen in the Hotel Royal Picardy at Le Touquet, by Debrunwei & Drobecq, an incoherent attempt to achieve gaiety and picturesqueness in a pseudo Gothic style.

GERMANY. A new Rathaus at Rustringen, by Fritz Hoyer, reveals all its architect's skill in the use of brick. It is free, modern, severe, and handsome, with a high central tower and the ends softened by projecting, concave, curved bays. Bold patterns in the brick work give shadows to the whole and at the entrance there is a pair of extraordinary brick lions flanking semi-circular steps of blue and gold tile. The whole forms a magnificent conception of great power and beauty. Several bridges over the Alster, in Hamburg, by the city engineer, Laug, have concrete arches faced with brick, capped by varied and delightful railings of playful iron, or brick and open-work tile.

The state radio building in Munich, by H. Reher, is a simple composition of window and wall, dignified but rather stark. Commercial buildings in Berlin, almost without exception, are designed with plain surfaces of stuccoed concrete and horizontal bands of windows and with modernist applied lettering for signs, such as the German Building and Land Bank, by Hans Jessen, and the Uhlanddeck, a restaurant by Kaufmann & Wolfenstein. The Israel department store, in Berlin, by H. Straumer, within a similar exterior has a great rotunda running the full height of the building, remarkable for its lighting fixtures and its flat surface treatment in veneered woods. The office building, Sprinkenhof, in Hamburg, by Fritz Hoyer, like most of the Hamburg building, is in brick with characteristic rich patterns.

IBERO AMERICAN EXPOSITION AT SEVILLE  
THE AMERICAN PLAZA

IMPERIAL CHEMICAL HOUSE  
LONDON  
SIR FRANK BAINES AND ALFRED COX, ASSOCIATED ARCHITECTS  
NOTABLE EUROPEAN ARCHITECTURE

The most impressive German industrial building of the year is the eleven-story Siemens-Schuckert factory at Siemensstadt, Berlin, by Hans Hertlein. With its setbacks, stair towers and vertical buttresses, it shows at its best the German talent for creating interesting forms for industrial buildings.

A large amount of German church building characterizes the year. Almost all of it is in the so-called modernist style, which varies from the charming and intimate municipal cemetery chapel at Hamburg, by Fritz Höger, to such fantastic designs as that for the St. Boniface Church at Hamburg, by Weber, or the bizarre Roman Catholic Church in Leipzig by T. Baurage. In general, the Roman Catholic churches are more radical than the Lutheran, but both classes frequently use square or rectangular flat-roofed naves and high, almost plain, towers, as in the St. Francis Church in Düsseldorf by Tietmann & Haase or the Lutheran Church at Altona by Emil Heynen.

Of the more radical educational work, the new portion of the Hanover technical school, by the regional architect, Kassbaum, is remarkable for its simple, flat brick façade, and the national school in Celle, by O. Haesler, for the bold patterning of grouped windows in its plain white walls, unbroken bands of glass marking the class rooms and unbroken, long, vertical windows lighting the stairs. More conventional, but still free and interesting, are the schools in Frohnau by Fritz Bayer and in Reussendorf, by E. Pietrusky.

The Mannheuer Hof in Mannheim, by F. and E. Kulzner, is a rebuilding of an older famous hotel in the contemporary fashionable modernist manner, with curved balconies at the corner to relieve the simple wall treatment. Fritz Höger's hospital at Delmenhorst is a long composition with two wings, decorated with varied and elaborate brick patterns between the rows of simple windows. Apartment buildings are almost universally simple and gain their effects solely by proportion, color, and texture. Frequently a forbidding and inhuman harshness results, but plans and groupings are always carefully considered. Important examples are a development in Düsseldorf, by W. Dunkel, which shows the increasing tendency toward high apartment buildings in Germany, and the apartment house in Hamburg by Hirsch & Deimling. The contemporary bleakness of modern housing developments in Germany is well illustrated by a new part of Berlin-Steglitz by Hans Jessen and also by the entire housing exposition at Breslau, especially the houses by Radtke & Lauterbach and those by P. Heim and A. Kempter and by H. Sabroun.

**ITALY.** The pavilion of the government of Rome at the Tripoli Fair, by A. Lemongelli, in its simplified Roman grandeur, is characteristic of the best trends of modern Italian architecture. There is a similar dignity in the war memorial at Spezia, by Manlio Costa, a semicircular colonnade beautifully proportioned and with simple details framing a tremendous female figure by E. Carmassi. The music building in Turin for the Verdi School of Music, by G. Ricci in association with G. Scanagatta, is in a modified Renaissance style as is also the Turin publishing house of Paravia & Co. by E. Strada and E. Chiaramella. The post and telegraph office at Sassari, by B. Cipelli, and the Casa Torri in Florence, by Zunkeller, both are examples of monumental buildings voluntar-

ily kept in close harmony with their old surroundings.

Italian churches are also largely archaeological. Especially noteworthy is the restoration and addition to the church of San Andrea in Orvieto and the new church at Lissone, by A. Conti, an impressive example of brick and stone Italian Gothic with a domed lantern at the crossing and a high campanile. The church for the European community at Alasio, by W. G. Newton & Partners, is treated more freely but is generally Romanesque in feeling. Its combination of brick and plaster is especially effective. The Italian Jewish Orphan Asylum at Rome, by D. Del Monte, combines the picturesqueness of its neighborhood harmoniously with clever planning for modern uses.

The most important examples of Italian domestic work are the Villa Alatri in Rome, by V. Morpurgo, a gorgeous baroque house, with extremely lavish interiors, a modernist house for Count Angelo del Bono in Rome, by L. and G. Lenzi, and a charming, informal villa at Capri, by A. de Angelis.

**SPAIN.** The two outstanding architectural events in Spain were the international expositions at Seville and Barcelona. That at Seville had a generally informal plan with all of the buildings designed in historical Spanish styles. The most imposing element was the front of the main building with a great quadrant arcade and two towers resembling the Giralda, by the late A. Gonzalez. A curved canal ran in front of the whole and fountains of Spanish tiles were used with delightful effect. The United States Building was by Templeton Johnson. The Barcelona Exposition, on the other hand, was more formal, more classic, and in the individual buildings more confused. The general plan, with magnificent terraced gardens and a great central axis, was laid out by Forestier of Paris, the Plaza de España at the entrance had a large fountain by J. M. Juvol and buildings by A. Florensa, P. DeAzua, and Calzada. The National Palace on the hill top, at the head of the plan, owed much to the Escorial near Madrid and a dome modeled on that of St. Peter's at Rome. It was designed by Cata & Cendova. Its interiors were confused and over elaborate. Other buildings were by Dader & Sagner. One of the most attractive features was a reproduction of a typical hillside Spanish village. Of other work of the year, the Press Building at Madrid, by P. Muguruza, a somewhat confused modern business building, the Tennis Club at San Sebastian, by L. G. Soto, a charming, low, tile-roofed building, the new Madrid Fronton for the game of *jai alai*, and the San Carlos Cinema, at Madrid, both by E. L. Lardet; and the Goya Corner, at Zaragoza, a beautiful, simple, modernist museum, by F. G. Mercadal, all deserve notice.

**OTHER COUNTRIES.** In Sweden, the recent concert hall in Stockholm, by I. Tengbom, shows the lavish modernized classic tendency so characteristic of Swedish work, and the Stockholm Library, by E. G. Asplund, with a high, circular central stack and reading rooms in rectangular wings, though modern in general form, has interior detail definitely Greek in influence. Two restaurants in Oslo, by Lars Backer, both in a rather simple modern style of German inspiration, and a new theatre in Oslo, by Blakstad & Dunker, with an interior also modern in feeling, are characteristic examples of recent Norwegian work. The Carls-

berg Museum in Copenhagen, by C. Harild, is distinguished by a simple and monumental façade with a large, square tower and the schoolhouse at Gentofte, by E. Thomson and N. Hanberg, shows a somewhat similar modern feeling, carefully restrained and harmonized with the earlier Danish work. The Heeringshof, a restaurant in Copenhagen, by B. Holweg-Möller, has lavish interiors, and the churches at Grundtvig and Odense, both by P. V. J. Klint, show an equal skill in the bold use of brick work. Almost all recent Scandinavian work, while free and distinctly modern in detail, is in a style much less doctrinaire and radical than the usual modern work of Germany and France, the attempt is always present to produce a harmony with traditional local forms.

Recent architecture in Belgium consists largely of suburban housing, almost all cubical and harshly modern, of which that by E. Taelmans outside of Brussels is typical. There was also completed in Brussels a Palais des Beaux Arts, by V. Horta, a low stone building neither successfully classic nor successfully modern. Much housing work of beauty and charm has been built in Switzerland. Particularly important are the groups at Mont Choisy near Geneva, by Brailard & Vial—large, simple, white apartment houses with many balconies, and at Zurich, the Birkenhof by Fröhlich, Kundig & Oetiker, apartment houses grouped around a great court in which the exterior is of Swiss baroque type. The Werkhofsgebäude in Neuhausen, by Scheurer & Meyer, use charmingly high Swiss roofs and stepped gables.

Typical of the extreme modernism of Holland are the Administration Building of the Konsumvereins at Amsterdam, by Buys and Lursen, a striking combination of horizontal bands of glass, the Theosophical Society Building at Amsterdam, by Brinkman & Van der Vlugt, on a stange, segmental plan, and the Van Nelle Tobacco Factory at Rotterdam by the same firm, effective in its unbroken, horizontal windows and its interesting mass.

Soviet work still remained largely in the projected stage, but an important industrial administration building in Charkow, Ukraine, by Serafimov, Kravets & Felger, was completed. It is a starkly simple development of a complicated radiating plan with bridges connecting the wings; the mass is impressive. Interesting designs in a similarly harsh and modernist manner have been published by Golosoff, Mowtschan, Posilkoiff, Markoff, and Vesnine. Finnish work in general follows the Scandinavian tendency of restrained modernism modified by traditional elements. Characteristic are a group of buildings by A. Aalto at Abo (Helsingfors), containing a restaurant, bank, and theatre, a group of offices in the same town and a cemetery chapel at Brändö, both by A. Lindgren, and a tuberculosis hospital by E. Forsman.

The opening of the Cuban Capitol at Havana, by E. L. Varela, revealed a building of conventional capitol plan and exterior but with magnificent and lavish interiors, tremendous in scale and effective throughout. American influence is dominant in its plan, colonnade, and dome, but inside there is a daring use of colored materials and a gorgeousness of conception and scale all too rare in the United States. An impressive statue of Cuba, by Zanelli, in a Roman niche, closes the main vista. The Theatre Pro Arte

Musical in Havana, by Moenck & Quintano, likewise shows American influence in its monumentality, but like many Havana buildings it is incoherent above the main cornice. The interior is particularly restrained and attractive. The Hotel Dos Hermanos in Havana, by O. Contreras, shows a commendable effort to preserve the old Havana atmosphere.

In the Argentine Republic, the most beautiful and unusual building of the year was the school built for the Jockey Club in Buenos Ayres, by Sanchez, Lagos, & de la Torre. It is a long, low building with great freedom of detail beautifully restrained. In general, the remaining Argentine work is still overelaborately Renaissance and confused in composition with ostentatious detail. Exceptions are the simple Casa San Vicente, by J. A. Beraitz, in a charming, modernized Spanish Renaissance style, an apartment house, by E. M. de Azua, and a large private house by Kasman & del Pont.

The architecture of Uruguay seems more influenced by traditional South American baroque tendencies, as in the Otero house, by J. Butler, and the apartment house, by J. C. Bazaiz, both in Montevideo, by contrast, the cinema theatre, by H. Bonomi, with its simple wall treatment, seems extremely modern.

**ARCTIC EXPLORATION.** See POIAR RESEARCH.

**ARCTIC GEOLOGY.** See GEOLOGY.

**ARGENTINA.** ar-jen-tē-na. A South American republic on the eastern coast of the southern part of the continent, consisting of 14 provinces, 10 territories, and the federal district. Capital, Buenos Aires.

**AREA AND POPULATION.** The total area of Argentina is 1,153,119 square miles. An official estimate of the population of the Republic, as of Jan. 1, 1928, based on the census of 1914, and the birth, death, and migration records since that time, showed a total population of 10,616,814. According to the census of 1914 (the latest official count), Argentina had 7,885,237 inhabitants. The number of immigrants in 1927 was placed at 294,404 and the number of emigrants at 184,329. Normally, there are an influx and exodus of large numbers of Italian and Spanish laborers before and after the harvests.

The 5,740,000 immigrants who entered Argentina from 1877 to 1926 were mainly Latin—natives of the States of southern Europe. The Italians and Spaniards alone constituted 79.6 per cent of the total, while the immigrants from all the non-Latin countries formed scarcely 15 per cent.

Increases in the non-Latin immigration (Polish, Russian, German, Yugoslav, Czechoslovak, and Lithuanian) in recent years have occasioned an important change in the nature of immigration into the country. Non-Latin immigrants formerly amounted to only 15 per cent of the total. Since the War, this proportion has increased rapidly. It was 19.6 per cent in 1922, 25.2 per cent in 1923, and 30 per cent in 1926. The proportion of foreigners in the population increased from 12 per cent in 1869 to 29.6 per cent in 1914, and then decreased to 23.7 per cent in 1925. Of the 87,020 immigrants entering Argentina in 1928, 27,803, or 32 per cent, settled in the city of Buenos Aires and 26,985, or 31 per cent, in the Province of Buenos Aires, the city and province together absorbing 63 per cent of the total. The gain by immigration for the year was 12.8 to the

thousand in the city of Buenos Aires, 9.08 in the Province of Buenos Aires, 7.05 in the Province of Santa Fé, 7.12 in the Province of Córdoba, and 11.4 in the Province of Mendoza. In the less populous provinces, the gain from immigration was insignificant.

The population of the larger cities was as follows: Buenos Aires (Jan. 1, 1928, 2,030,765); (June, 1914, 1,575,813); Rosario (Santa Fé), estimated 1927, 410,000, (1914, 222,592); Córdoba, estimated, 1928, 221,200, (1914, 134,935); La Plata, estimated, 1928, 165,813, (1914, 90,436); Santa Fé (1929), 105,000, Tucumán, 100,000; Bahía Blanca, 80,000, Mendoza, 70,000. In 1927 the Federal government established 29 towns and 12 colonies on 1,373,320 acres of public land.

**EDUCATION** Under the Ministry of Justice and the cabinet of the Chief Executive of the nation, the school system of the Argentine Republic is centralized. Although certain liberties tending toward autonomy are delegated, as in the case of the university, the Federal government was particularly considered the source of all good and evil in matters of education. Elementary instruction is free, secular, and compulsory for children from 6 to 14 years of age. In 1927 there were 11,419 primary schools, with an enrollment of 1,373,494 pupils. Secondary, normal, commercial, industrial, and trade schools for public instruction in 1928 totaled 206, with 45,229 pupils, 111 private secondary and normal schools had 9920 students. The five national universities, of Buenos Aires, La Plata, Córdoba, the Litoral, and Tucumán, had a total enrollment of 15,843 students. On June 13, 1929, President Irigoyen signed a decree setting aside \$2,200,000 for new primary schools and a school census.

**PRODUCTION** The country is agricultural, its principal resources being cereals and animal products. It is self-sufficient in the matter of food stuffs, its prosperity depending upon the surplus production and foreign marketing of these articles. Industrial development, therefore, has concentrated in the preparation of foodstuffs. Except for meat packing, flour milling, the dairy industries, sugar refining, and other industries concerned with the first stages of the working of raw materials, the manufactures are unimportant and insufficient for domestic needs. The production of manufactured goods was greatly stimulated by the World War, however, the greatest progress having been made in the dairy, tanning, footwear, wool scouring and carding, woolen textile, forest products, wine, and meat industries, and to a lesser degree in the manufacture of cotton piece goods, glass and china ware, tools and light machinery, sackings, and cement. A later incentive to national industry was Argentina's tariff policy, the avowed purpose of which is the protection of home industries using domestic raw materials. The chief obstacle to such industries is the lack of domestic fuel. Most of the coal used in Argentina came from Great Britain and the petroleum supplies, from the United States and Mexico. The industries of Argentina are centered in the Province of Buenos Aires, where capital invested in industrial and commercial establishments was estimated to exceed \$1,000,000,000 in 1929.

The area of Argentina is about 700,000,000 acres, of which about 250,000,000 acres may be used for agriculture, the same for cattle grazing, and approximately 100,000,000 acres represent

woodland. About 10,000,000 acres require irrigation. In 1927 only 10.4 per cent of the arable land was under cultivation. The 1928 acreage under cultivation increased by 2,321,800 acres over that for 1927. The estimated acreage under wheat in 1928-29 was 20,298,480, and the production, 8,457,700 metric tons, oats, 3,744,000 acres, 1,460,000 tons, linseed 7,086,720 acres, 2,952,800 tons, maize (1927-28), 11,805,600 acres, 8,000,000 tons. The area under sugar was about 237,500 acres and the production in 1928 amounted to 414,527 tons, under the vine, 280,000 acres, which produced 89,976,470 gallons of wine in 1927. Cotton was planted on 71,746 acres, which produced 73,410 tons (estimated) in 1927-28. The ginned cotton crop in 1928 amounted to 25,000 metric tons, of which 72 per cent was exported. The 1927-28 wool production was estimated at 146,098 metric tons.

The steady expansion of agriculture is indicated by the following comparative figures for exports in metric tons in 1928 and in 1910-14 (average year): wheat, 5,295,835 tons in 1928, 2,118,242 in 1910-14, maize, 6,372,181 tons and 3,193,973 tons, linseed, 1,944,402 tons and 678,880 tons, flour, 169,090 tons and 111,489 tons. Exports of oats decreased, 299,704 tons being exported in 1928, as compared with 604,362 in 1910-14. The chief obstacles to agricultural progress were droughts, locusts and other pests, lack of grain elevators in the grain belt, and the ownership of much of the land by absentee landlords, who found it easier to raise cattle and sheep. Argentina was not yet self-sufficing, in 1927, 11.1 per cent of its total imports were foodstuffs, including imports valued at \$6,363,831 from the United States.

**MEATS** is the principal industry. In 1928, 508,000 tons of frozen and chilled beef were exported. In 1927, 4,650,530 cattle and 5,291,234 sheep were killed and refrigerated. Flour milling ranks second, the average annual output being 7,000,000 sacks. An 81,000-ton grain elevator was under construction at Bahía Blanca in 1929.

The dairy, quebracho extract, and textile industries also were expanding rapidly, the latter being highly protected against foreign competition. Exports of quebracho extract, used by tanning industries in the United States and Europe, totaled 206,000 metric tons in 1928. Argentina imports much of the lumber and wood products used, its own large forested areas being too far from the centres of population for economical exploitation. A great variety of minerals are found but are either of low grade or inaccessible. Oil production, though small, was increasing, amounting to 9,100,000 barrels (1,459,600 tons) in 1928. In 1929 an official estimate placed the number of manufacturing establishments in the country at 61,000, their motive power at 1,000,000 horse power, their employees at 600,000, and their output at \$1,225,000,000 annually.

**COMMERCE** According to figures published in the *Pan-American Bulletin* for May, 1929, Argentina's foreign trade in 1928 totaled 1,930,000,000 gold pesos, as compared with 1,864,800,000 gold pesos for 1927. Exports accounted for 1,023,000,000 pesos of the 1928 total and imports for 907,000,000 pesos, giving a favorable balance of 116,000,000 pesos. The net importation of gold during the year was 86,300,000 pesos (par value of the gold peso, \$0.9648). Imports in 1927 amounted to 856,610,000, and exports to 1,008,178,000 pesos, the balance of trade being favor-

able by 151,568,566 pesos. In 1926 there was an unfavorable balance of 30,317,975 gold pesos. The countries supplying the bulk of Argentine imports were the United States, United Kingdom, Germany, Italy, France, Brazil, and Belgium, in the order named. The United Kingdom was by far the largest purchaser of Argentine products, with Germany, the United States, Belgium, France, Italy, Brazil, and the Netherlands ranking in order.

Imports from the United States were greater in 1929 than in 1928, although a recession was noted in the last quarter of the year. In 1929 the United States took approximately 10 per cent of Argentina's total exports, as compared with 5 per cent of the total before the World War. Exports in 1929 in metric tons included: Wheat, 6,689,000; corn, 5,070,000; linseed, 1,682,000; oats, 443,000; barley, 249,000; flour, 125,000; quebracho logs, 157,000; quebracho extract, 187,000; butter, 16,500; sheepskins, 13,000; wool, 136,000; cotton, 20,000; oxhides, 103,000. Also 1,000,000 quarters of frozen beef, 5,449,000 quarters of chilled beef, and 3,883,000 frozen mutton and lamb carcasses.

FINANCE The budget for 1929 provided for revenues of 7,310,000,000 and expenditures of 732,796,794 paper pesos. The sum of 158,000,000 pesos, appropriated for public works, was to be covered by bonds of the internal debt, and 28,644,225 pesos, allowed for subsidies and charity, was to be met by the proceeds of the national lottery. In 1928 the revenues were estimated to total 681,394,114 and expenditures 762,804,207 pesos. There being no income tax, about 76 per cent of the revenue is obtained from import duties and 10 per cent from direct taxation. Receipts of the Buenos Aires Customs House in 1928 amounted to 356,708,491 pesos, an increase of 34,320,075 pesos over the 1927 total. While partly attributable to the higher prices of exported products, the increase nevertheless reflected a decided expansion in the volume of foreign trade. The national consolidated debt on Dec 31, 1927, totaled 2,155,518,098 paper pesos, of which 1,103,820,137 pesos represented the external, and 1,051,697,961 the internal debt. On the same date, the floating debt amounted to 448,440,376 paper pesos. Paper money in circulation on Jan 1, 1929, amounted to 1,405,875,362 pesos. According to figures compiled by the U. S. Department of Commerce, Argentine securities totaling \$597,804,000 were floated in the United States during the period 1920-28, inclusive. Of this sum, \$452,425,000 represented government issues; \$118,017,000, provincial securities, and \$27,362,000, municipal securities.

The national reserves of gold increased from \$444,000,000 at the end of 1924 to \$607,000,000 at the end of 1928 and in 1929 the National Bank of Argentina exported large amounts to New York and European financial centres for ultimate use in stabilizing the peso. From June 1 to August, 1929, gold to the value of \$30,000,000 was exported to New York.

COMMUNICATIONS Railway trackage in operation in Argentina in 1928 totaled 22,791 miles, of which 4418 miles belonged to the state and 18,373 miles to private companies. The state and private railroads in 1927 carried 149,507,178 passengers and 52,928,126 tons of freight, for which the revenues amounted to 146,840,800 gold pesos, as against 137,942,400 in 1926. A construction programme involving 390 miles of new track from

Villa del Rosario and Córdoba to the main line of the Central Argentine Railway to Tucumán and an additional 680 miles of track in the northern part of the country was announced in 1929. A new government-owned line, running a distance of 75 miles from Alta Córdoba to La Puerta, was opened early in 1929. A number of lines running out of Buenos Aires were electrifying their trackage for short distances from the capital in 1929 and extensive alterations and improvement on the great Plaza Constitución passenger terminal in Buenos Aires, commenced in 1923, were virtually completed. Several airmail and passenger routes were opened during the year. The government operates 25,763 miles of telegraph line. On Jan 1, 1929, there were 200,924 telephones in use in Argentina.

GOVERNMENT. The executive power is vested in a President elected for six years, and the legislative power in a national Congress, comprising a Senate of 30 members elected for nine years, and a Chamber of Deputies of 158 members elected for four years by the people at the ratio of one deputy for every 49,000 inhabitants (census of 1914). One-third of the Senate retires every three years and one-half of the Chamber every two years. The cabinet is appointed by and under the direction of the President, and comprises the departments of foreign affairs, finance, interior, justice, public instruction, war, marine, and public works. President Hipólito Yrigoyen was elected for the term 1928-34. The vice president and president of the Senate in 1929 was Dr. Enrique V. Martínez.

HISTORY The history of Argentina during 1929 was marked by disturbed political conditions threatening the breakdown of constitutional government, the policy of isolation followed by the Yrigoyen administration, and evidences of a growing irritation in connection with the tariff policy of the United States. The tariff controversy was intensified by an agricultural crisis which it was feared would be made still worse by the threatened exclusion of additional Argentine farm products from United States markets. A succession of serious strikes and labor troubles partially paralyzed the economic life of the nation.

President Yrigoyen encountered serious obstacles in carrying out his policies during the first year of his second administration. He announced his programme as one of political reform, economic progress, and international good will, but little progress was apparent in any of these spheres at the end of 1929. Early in the year, the President boldly attacked graft and corruption in Argentina. He removed the highest officials of a number of provinces, instituted criminal proceedings against them, and assumed personal charge of the respective provincial governments. Criminal proceedings also were begun against 22 ex-legislators and one ex-mayor, charged with illegal acts in connection with public contracts, and the contracts were voided.

In April and again in June, the action of the Yrigoyen faction in both the Senate and National Assembly in absenting themselves from sessions forced both bodies to interrupt their deliberations for lack of a quorum. The abstentions followed attempts to seat three anti-Yrigoyen senators elected from the provinces of Mendoza and San Juan, in which the President had assumed control. The Senate on August 3 and September 23 rejected the credentials of the three senators, one of whom, Dr. Carlos Washington Lencinas, former Gover-

nor of Mendoza, was assassinated on November 10 while addressing a political meeting. In the outbreak which followed the shooting, 21 persons were wounded and three killed.

In the meantime, criticism of the Administration became more and more active, the press dwelling particularly upon the failure to pay a number of government bills, the President's failure to appoint an Ambassador to Washington, his arbitrary handling of departmental heads, his intervention in four provinces, and the prevalence of labor troubles. On November 30, the Senate adopted a resolution condemning the Government's intervention in the province of Corrientes. Strikes completely paralyzed for a time exports of wheat and other commodities from seven ports in the Province of Santa Fé. In the port of Rosario, a general strike took effect July 25. Government supporters accused labor leaders of trying to bring about a nation-wide Communist strike. The attacks on the President's policies culminated in a motion for his impeachment introduced into the Chamber of Deputies on September 25. On December 24, a dental mechanic named Gualberto Marinelli fired three shots at President Irigoyen at close range in an attempt to assassinate him as he left his residence. Irigoyen escaped harm, however, and Marinelli was killed by shots of his escort.

A long drought, ending with torrential rains which brought disaster to many small farmers of the Entre Ríos wheat region, and the prevailing agricultural depression led to demands for "farm relief" similar to those put forward in the United States. On November 2, the President signed a decree authorizing the Ministry of Agriculture to renew without interest obligations for seed incurred by farmers in planting the new crop, at the same time halting legal proceedings for the collection of such debts. Establishment of a Federal Farm Board similar to that created by President Hoover in the United States was urged by *La Prensa*, a leading Buenos Aires daily.

The conclusion in November of a trade agreement between Argentina and Great Britain was generally regarded as the Administration's answer to the high tariff policy of the United States, and particularly to the effort to impose higher duties on farm produce. The agreement which was negotiated by the distinguished American Mission to Argentina, provided the Argentine Government with a two-year credit of 10,000,000 pesos for the purchase of construction materials for railways and public works in Great Britain. Great Britain received a similar credit in Argentina for the purchase of grain, wool, meat, and other foodstuffs. European observers saw in the agreement an effort by Argentina "to free itself financially from the United States" and to forestall the American commercial advance there. In this connection, it is of interest to note that the Argentine railroads, most of which are controlled by British capital, have adopted rules restricting membership on their boards of directors to Argentines and Englishmen. Many Argentines, particularly the agriculturalists, were opposed to retaliatory tariff measures against the United States, feeling that their country would lose rather than profit by it. However, the government's failure to send representatives to the Pan-American Arbitration Conference in Washington in January or to ratify the Kellogg-Briand Peace Pact was attributed mainly to irritations incident to the United States tariff policy and the feeling that Argentina was being

deliberately discriminated against. The Argentine press continued to assail the foreign policy of the United States with regard to the Monroe Doctrine and intervention in the Caribbean area, particularly following the outbreak in Haiti in November.

President Hoover was greeted with considerable cordiality in Buenos Aires during his pre-mauguration good-will tour of Latin America and in many Argentine quarters his utterances with regard to American policy were sympathetically received. *La Prensa*, however, following Mr. Hoover's Armistice Day address, said editorially that the policy of the United States toward Latin America was the equivalent of force, regardless of the statements of her spokesmen, and declared that the United States has neither the right nor obligation of guardianship over the small countries of the Caribbean.

Activities of the Fascists in Argentina similar to those which aroused public attention in the United States during 1929 were rudely checked early in the year when President Irigoyen ordered Argentine ports closed to Italian shipping, a measure which caused a sudden change in the policy of the Italian government.

The position of Argentina with regard to the League of Nations remained ambiguous. The former administration accepted membership in the League, but the question of ratification was not brought before Congress and for two years Argentina, although appearing as a member of the League in official documents, had not been represented at Geneva or given the League financial support.

A boundary dispute with Bolivia of 100 years' standing was settled on April 23, when the Bolivian Congress ratified a treaty which had been signed July 9, 1925.

The explorations of two German explorers in the wilds of the Brazilian state of Mato Grosso, revealing that the great rivers of virtually the entire region east of the Andes originate there and may be readily linked by canals to form probably the greatest river chain in the world, aroused much interest in Argentina and the other South American countries, where the possibility of internal waterways was discussed.

On December 16, President Irigoyen, by presidential decree, ordered the closing of the Caja de Conversión, or Argentine gold exchange office. The action was generally criticized by bankers, who predicted that it would serve to aggravate an already serious financial and business situation. Exchange rates on the dollar rose on the following day from 106.80 Argentine gold pesos for \$100 to 116 gold pesos for \$100, but later dropped to a more normal level. With the peso at par, the exchange rate is \$100 for 103.64 pesos. The presidential decree explained the closing of the Caja de Conversión, by stating that the irregular state of the world's exchange market "exerts a damaging influence upon our market, causing shipments of coined gold from this country without justified causes." The American export trade to Argentina was expected to suffer heavily since the unfavorable effect of the decree on the Argentine exchange would raise materially the cost of everything paid for in dollars.

**ARIZONA.** POPULATION. According to the Fourteenth Census, the population of the State on Jan. 1, 1920, was 334,162. The estimated population on July 1, 1928, was 474,000. The capital is Phoenix.

**AGRICULTURE.** The following table gives the acreage, production, and value of the principal crops in 1928 and 1929:

Crop	Year	Acreage	Prod Bu	Value
Cotton	1929	238,000	158,000 *	\$17,550,000
	1928	200,000	148,000 *	17,508,000
Hay	1929	203,000	689,000 *	12,857,000
	1928	195,000	702,000 *	12,614,000
Wheat	1929	42,000	1,184,000	1,531,000
	1928	47,000	1,269,000	1,650,000
Corn	1929	41,000	1,148,000	1,492,000
	1928	39,000	1,014,000	1,268,000
Grain sorghums	1929	52,000	1,560,000	1,482,000
	1928	52,000	1,508,000	1,206,000

\* Bales    \* Tons

**MINERAL PRODUCTION.** Copper increased in 1928 its predominance in the mineral production of the State. While the respective quantities of gold, silver, lead, and zinc mined in that year all fell below the corresponding quantities for 1927, that of copper surpassed not only the total of 1927 but that of the more active year 1926. There were produced in the State in 1928, 732,276,803 pounds of copper, in 1927, 682,190,547 pounds. The value of the product of 1928 exceeded that for 1927 more greatly than appeared in the respective quantities, for the copper of 1928 had an estimated average value of 14 4 cents a pound, as against 13 1 cents for that of 1927. The aggregate of the value of gold, silver, copper, lead, and zinc produced was, for 1928, \$114,300,381; for 1927, \$98,790,957. Quantities produced in the respective years were gold, 191,927 23 fine ounces in 1928 and 200,494 59 in 1927, silver, 6,791,351 fine ounces (1928) and 6,847,680 (1927), lead, 14,380,964 pounds (1928) and 19,865,961 (1927); zinc, 1,278,036 pounds (1928) and 2,268,960 (1927). The reported production of clay products for 1927 scored a sharp increase over that for the year previous and attained \$345,391, bringing it close to that of lime, the leading mineral outside the five-metal group, which attained \$390,074. For 1927 the value of all mineral products was \$100,558,556, as against \$115,047,897 for 1926. The decline of 1927, due chiefly to a fall in copper output, was approximately made up in 1928.

The value of gold, silver, copper, lead, and zinc produced by mines in Arizona in 1929 was about \$158,433,300, an increase from \$114,300,381 in 1928, according to estimates of the U S Bureau of Mines. The mines of this State not only made a general increase in the output of the five metals, but a remarkable increase in the output of copper, which made a new record for the State far in excess of the record of 1918, when the total was 704,855,874 pounds of copper. The large producers of copper responded to the increased price of the metal, especially during the first six months of the year, and made a production of copper which exceeded that of 1928 by more than 101,000,000 pounds. There was a large increase in the output of gold corresponding to the abnormal increase in the output of copper, but the decrease in gold from ore in Mohave County was pronounced. The prices of lead and zinc, slightly higher than those of 1928, did not result in a marked increase in the State totals for lead and zinc, although good increases were made at individual mines, such as the Montana property in Santa Cruz County and the Seventy-nine Mine in Gila County. Large expenditures were made in improvement; at the copper smelters, in construction work on a copper refinery at El Paso,

Tex., and in building new mills, especially at the Verde Central mine at Jerome and the Christmas Mine in Gila County. Dividends amounting to \$27,611,659 were reported in 1929 by the following mining companies Calumet & Arizona, United Verde, Inspiration, United Verde Extension, Miami, Magma, New Cornelia, and Arizona Commercial. Dividends of \$5,500,000 also were paid, it was reported, by the Phelps Dodge Corporation, which operates the Copper Queen and Morenci properties in Arizona and other mines in Mexico and New Mexico. Profits from the Ray Mine were included in dividends of \$3,937,500 reported paid by the Nevada Consolidated Copper Company, operating properties in Nevada, Arizona, and New Mexico. The gold output increased from \$3,907,488 in 1928 to about \$4,217,000 in 1929 due to the unusual activity at the leading copper mines. The silver output increased from 6,791,351 ounces in 1928 to about 7,257,000 ounces in 1929, but the value decreased from \$3,972,940 to about \$3,875,000, as the average price of silver decreased from 58 5 cents an ounce in 1928 to 53 4 cents an ounce in 1929. The output of silver from Arizona mines has gradually increased in recent years and the State ranked fourth in the production of this metal after Utah, Montana, and Idaho.

The copper output increased from 732,276,803 pounds in 1928 to about 833,525,000 pounds in 1929, and the value from \$105,447,880 to about \$149,200,000. As the average price of copper increased from 14 4 cents a pound in 1928 to 17 9 cents in 1929, mines in Arizona increased their output decidedly and the production in 1929 was the largest that has ever been recorded. The largest copper producers in 1929 were the United Verde, Copper Queen, Inspiration, New Cornelia, Nevada Consolidated (Ray Mines), Miami, United Verde Extension, Morenci, Calumet & Arizona, Magma, Old Dominion, and Shattuck Penn mines. Other mines that produced more than 1,000,000 pounds of copper each were the Christmas, Arizona Commercial, Verde Central, El Tiro-Imperial group, and De Soto properties. The lead production in Arizona increased from 14,380,964 pounds in 1928 to about 15,500,000 pounds in 1929, and the value from \$834,096 to about \$984,250. The output of zinc recovered chiefly from mines in Santa Cruz County increased from 1,278,036 pounds in 1928 to about 2,357,000 pounds in 1929, and the value from \$77,997 to about \$136,800. The increase in zinc was due to the increased shipments of zinc concentrate by the Eagle-Picher Lead Company.

**TRANSPORTATION.** The total number of miles of railroad line in operation on Jan 1, 1929, was 2494 47. No additional construction in 1929 was reported.

**MANUFACTURES.** According to the biennial Federal Census of Manufactures published by the U S Department of Commerce in 1929 and dealing with operations of 1927, there were in the State, in 1927, 300 manufacturing establishments. These employed 8967 wage earners, whose wages for the year totaled \$12,132,957. Materials and supplies used in production cost \$77,799,198. Manufactured products attained the combined value of \$117,624,434.

**EDUCATION.** Steps were taken, according to Superintendent of Instruction Case in the *Journal* of the National Education Association, to end with the close of the calendar year the issue of elementary teaching certificates to applicants who

had not completed at least a three-year course for the training of teachers.

**CHARITIES AND CORRECTIONS** The central administrative authority as to correctional and benevolent work was the Board of Directors of State Institutions. As functioning in 1929, it was composed of the Governor, the State Treasurer and one appointed member. It had jurisdiction over 5 State institutions. These, with the numbers of their respective inmates, in December, were: State Prison, 530; Asylum for the Insane, 742; Industrial School for Boys, 100; State School for Girl Juvenile Offenders, 20; Pioneers' Home, 120. The board was charged also with general supervision of a Public Employment Bureau. The Pioneers' Home was a refuge for destitute residents over 60 years of age, of at least 35 years' residence in the State; it was intended specifically for pioneers, but there was under construction in 1929 a building to harbor old and destitute miners who had worked long in the State. A new cell house at the State Prison was being built by prison labor. There was completed an addition to the Asylum, to hold 200 more patients.

**POLITICAL AND OTHER EVENTS** The State authorities continued throughout the year their opposition to the Federal project for damming the Colorado River at Black Canyon (the so-called Boulder Dam project). Arizona stood out persistently for a greater share in the allocation of water and power rights to accrue from the dam than had been accorded in the Federal law of 1928. The State's Colorado River Commission on January 15 authorized the filing of a suit in the United States Supreme Court with the purpose of overthrowing the Johnson-Swing Act. Likewise, the State abstained from signing the new Seven-State Colorado River Compact to enable the Government to proceed. At a conference of representatives of the States of Arizona, Nevada and California held at Santa Fe in March, the Arizonians made several proposals, one being that Los Angeles should pay \$2 for every acre-foot of water drawn from the river for domestic purposes. The conference eventually broke up without agreement. It was a further demand of Arizona that all water from the Gila River system should be exempted from deduction for future claims that Mexico might establish to water rights in the Colorado under treaty. A correspondence between Secretary of the Interior Wilbur and the Governor of Arizona led to no result. The disadvantage that delay in building the dam must cause to the interests of the Imperial Valley, by reason of prolonged flood risks, rendered the tactics of obstruction formidable.

The Grand Canyon Bridge, described as the second bridge in height in the world, was dedicated on June 14. It spans Marble Canyon, on the Colorado River in northern Arizona. Somewhat over 600 feet long and 400 feet high, it is situated some miles west of Lee's Ferry and about 130 miles north of Flagstaff. At the time of its opening, it was the only bridge across the river between Green River in northeastern Utah and Needles in southwestern Arizona. A company conducting mining operations in the Meteor Crater, near Winslow, according to an announcement made in October, located by diamond drills the expected mass of iron ore in the pit of the crater, at a depth of 1400 feet.

**OFFICERS** Governor, John C. Phillips; Secretary of State, I. P. Frazier, Attorney-General, K. Berry Peterson, Treasurer, Charles R. Price,

Auditor, Ana Frohmler; Superintendent of Public Education, C. O. Case.

**JUDICIARY** Supreme Court Chief Justice, Alfred C. Lockwood, Associate Judges, A. G. McAlister, Henry D. Ross.

**ARIZONA, UNIVERSITY OF** A coeducational, State institution of higher learning in Tucson, Ariz., founded in 1885. The 1929 autumn enrollment totaled 1911; the registration for the summer session of 1929 was 229. The faculty numbered 162. The endowment fund amounted to \$20,000, and the income for the year was \$1,637,922. The university receives both Federal and State support. The library contained approximately 77,000 volumes. President, Homer LeRoy Shantz, Ph.D., Sc.D.

**ARKANSAS POPULATION.** According to the Fourteenth Census, the population of the State on Jan. 1, 1920, was 1,752,204. The estimated population on July 1, 1928, was 1,944,000. The capital is Little Rock.

**AGRICULTURE** The following table gives the acreage, production, and value of the principal crops in 1928 and 1929:

Crop	Year	Acreage	Prod Bu	Value
Cotton	1929	3,834,000	1,490,000 *	\$124,415,000
	1928	3,681,000	1,246,000 *	118,886,000
Corn	1929	1,882,000	26,868,000	25,821,000
	1928	2,002,000	34,034,000	30,971,000
Hay	1929	754,000	752,000 *	11,415,000
	1928	758,000	794,000 *	10,934,000
Rice	1929	154,000	7,084,000	6,517,000
	1928	164,000	7,823,000	6,728,000
Oats	1929	186,000	4,886,000	2,798,000
	1928	155,000	3,410,000	2,012,000
Potatoes	1929	81,000	2,697,000	3,776,000
	1928	36,000	2,700,000	2,160,000
Sweet potatoes	1929	26,000	1,716,000	1,973,000
	1928	28,000	2,520,000	2,268,000
Sorghum sirup	1929	41,000	2,327,000 *	2,220,000
	1928	40,000	2,800,000 *	2,520,000

\* Bales    \* Tons    \* Gallons

**MINERAL PRODUCTION** Petroleum production, though it continued to furnish the chief feature of the State's mineral industry in 1928, decreased sharply in quantity and for reasons of prevailing price declined even more in total value, as compared with 1927. There were produced, in 1928, 32,395,000 barrels of petroleum, in 1927, 40,003,000. The value of petroleum produced in 1928 was \$27,400,000 (estimated), in 1927, \$42,400,000. The natural-gas gasoline produced in 1928 was less in quantity than in 1927, but higher in value, the quantities being, respectively, 32,500,000 and 37,408,000 gallons, the values, \$2,554,000 (estimated) and \$2,281,000. The production of all natural gas (unavailable for 1928) was 30,450,000 M cubic feet, in value \$4,281,000 for 1927 and 43,566,000 M feet, \$5,817,000 for 1926. The production of coal remained active, being 1,548,834 short tons in value \$5,393,000, for 1927, and 1,680,973 tons, in value \$5,615,000, in 1926. Little Rock, in which Arkansas was the predominant producer, was mined in greater quantity than the yearly average, although the production of other States fell. The State produced in 1928, 361,236 long tons, valued at \$2,193,230, as against 303,830 tons, \$1,692,800, in 1927. Clay products, the only other mineral production in excess of a total value of \$1,000,000 a year, attained \$1,285,720 in 1927, as against \$1,544,771 in 1926. The entire mineral product of the State had, for 1927, a value of \$59,449,100, for 1926, of \$84,465,672.

**TRANSPORTATION** The total number of miles of railroad line in operation on Jan. 1, 1929, was 4822.20. There were built, in 1929, 29.23 miles of first, and 5.05 of second, track.

**MANUFACTURES** According to the Federal biennial Census of Manufactures published by the U. S. Department of Commerce in 1929 and dealing with the operations of 1927, there were in the state, in 1927, 1146 manufacturing establishments. These employed 40,032 wage-earners, whose wages totaled \$35,288,169 for the year. Materials and supplies used in production cost \$103,815,280. Manufactured products attained the combined value of \$182,750,871.

**EDUCATION** A prospect of placing the State equalization fund on a more productive and reliable basis was brought about by the enactment of a State net income tax law. The school population of the State in 1929 was estimated to number 620,739. There were enrolled in the public schools 479,108 pupils, of whom 440,469 were in elementary schools and 38,639 were in high schools. The expenditures for public-school education in the course of the year 1929 were current, \$11,101,551; outlay and debt service, \$4,516,179. The salaries of teachers averaged \$699.

**CHARITIES AND CORRECTIONS** Institutions of the State were under decentralized control, in virtue of a law of 1928 which abolished the previously existing State Board of Charities. The chief eleemosynary and correctional institutions were State Hospital for Nervous Diseases, Little Rock, with a subsidiary dairy farm, Confederate Home, at Sweet Home, Boys' Industrial School, near Pine Bluff, State Farm for Women, near Jacksonville, State Penitentiary, Little Rock, Arkansas State Training School for Girls, near Alexander, State Tuberculosis Sanatorium for Negroes, School for the Blind, School for the Deaf. The boards of the reformatory institutions had recommendatory power as to paroles, the Penitentiary Board had a special parole officer. Purchases for the institutions were contracted by a single State purchasing officer.

**LEGISLATION** The State Legislature held its regular biennial sixty-day session, adjourning March 14. An income-tax measure was enacted, to go into effect August 1. The estimated proceeds of the income tax were \$2,500,000 per annum. Of these proceeds one-tenth were to be employed for the rehabilitation of certain of the State institutions, one-third to create a fund for contributions on the part of the State to rural school districts in order to insure them a school term of not less than nine months, and the remainder, or somewhat over one-half, to offset a reduction in the general property tax. A comprehensive highway programme for the State also was enacted. The Legislature passed a "basic science" statute on the model of those in force in certain other States, under its provisions those intending to practice the healing arts were required to pass examination in anatomy, physiology, chemistry, bacteriology, and pathology, and to have had the equivalent of a high-school education, Christian Science practitioners and certain others were made exempt from these provisions. A back tax bill was enacted, setting the limitation of five years on tangible property and seven years on intangible property as the time limit for suits against corporations where these were asked to pay higher taxes because of alleged underassessment. A measure to legalize horse racing and, therewith, a system of parimutuel betting was

passed by the Legislature after an acrimonious contest involving charges of corruption, but the measure was vetoed by Governor Farnell after the adjournment.

**POLITICAL AND OTHER EVENTS** The construction of a 100-mile pipe line to transport natural gas from the Monroe field, out of the State and to Shreveport, La., was undertaken in May by the Cities Service Company. Provisions were made by Congress for opening 160,000 acres of the National Arkansas Forest, in the Ouachita Mountains, as a national park. The city of Little Rock held a referendum on April 2 on the question of permitting professional baseball on Sundays and voted heavily in the affirmative.

**OFFICERS** Governor, Harvey Parnell, Secretary of State, Jim B. Higgins, Treasurer, Ralph Koonce, Auditor, J. O. Humphries, Attorney-General, Hal L. Norwood, Superintendent of Public Instruction, J. P. Womack, who resigned in 1929 and was succeeded by C. M. Hirst.

**JUDICIARY** Supreme Court Chief Justice, Jesse C. Hatt, Associate Justices, Frank G. Smith, T. H. Humphreys, William F. Kirby, Thomas M. McHaffey, E. L. McLeaney and Carroll D. Wood, who was retired in 1929 and succeeded by Turner Butler.

**ARKANSAS, UNIVERSITY OF** A coeducational State institution of higher learning in Fayetteville, Ark., founded in 1871. It comprises the colleges of arts and sciences, education, engineering, agriculture (including experiment station), and schools of law, business administration, and medicine, the last named being in Little Rock. In the autumn of 1929, the enrollment was approximately 2000, and for the summer session of 1929, it was 897. The number of faculty members, including administrative officers, was 201. The productive funds amounted to \$132,000 and the income for the year 1929-30 was about \$1,200,000. The library contained approximately 92,000 volumes. President, John Clinton Futall, LL.D.

**ARMAMENT, LIMITATION OF NAVAL** See NAVAL PROGRESS.

**ARMENIA.** The name applied, since Jan. 16, 1923, to one of the three constituent republics of the Transcaucasian Socialist Federated Soviet Republic, a member of the Union of Socialist Soviet Republics. Capital, Erivan. Before the World War, Armenia sometimes indicated the Armenian territories of the former Turkish Empire and sometimes the entire region in which the dominant racial element was Armenian. In the former Turkish Empire, the Armenians constituted about 38.9 per cent of the population in the following vilayets: Erzerum, Bitlis, Khairut, Diarbekr, Sivas, and Van, being in the minority in the first five and a majority in the last named. The present number of Armenians in the Turkish Republic is unknown, a large part of the Armenian element having disappeared from Anatolia during the War and afterward as a result of massacres, deportations, and expulsions. The population of the former Turkish Empire known as Armenia and Kurdistan was given at 2,470,900.

**ARMENIAN SOCIALIST SOVIET REPUBLIC.** Armenia was proclaimed a Soviet Republic on Dec. 2, 1920. It comprises the southeast frontier region of Transcaucasia, which formerly belonged to the Russian Empire, but which in November, 1917, split off from Bolshevik Russia. The entire Transcaucasian region comprised the three main peoples, Armenians, Georgians, and Tartars, and was

at first constituted into a federal republic, which lasted only a few weeks, however, due to the diversities of race and language. It dissolved into three parts, the Armenian Republic, Georgia, and Azerbaijan, each of which declared its independence. Although the Armenian Republic was recognized by the Allies in 1920, it soon fell under the sway of the Bolsheviks and was absorbed into their federation.

During the first Transcaucasian Soviet Congress of Dec. 13, 1922, the three Soviet Republics of Armenia, Azerbaijan, and Georgia again united to form the Transcaucasian Socialist Federated Soviet Republic. A federal constitution was accepted by the Congress and published Jan. 16, 1923. The area of the Republic is 11,945 square miles and the population in 1926 numbered 876,557, 86 per cent being Armenians, 10 per cent, Turko-Tatars; and 24 per cent, Russians. According to the Soviet Union Year Book for 1929, Armenians constitute 1 per cent of the total population of Soviet Russia, or approximately 1,470,136. Armenia is an agricultural country, only 10 per cent of the population living in towns. Eriwan has 90,000 residents. The school attendance in the Republic in 1925 was given at 81,000 pupils and there are a state university and several technical trade schools.

Agriculture, which is partly carried on with the aid of irrigation, is the chief industry of the people. Among the leading products are wheat, rice, licorice root, tobacco, and cotton. The area sown in 1925 was 255,900 dessiatines, which represents the pre-war area under cultivation. The cultivation of cotton, which fell away almost to nothing after the Bolshevik Revolution, is gradually assuming its place of importance in the agricultural activities, more than 15,000 dessiatines being devoted to its culture. The mining of copper is a leading industry, 1500 persons being engaged in this pursuit. Having no seaports, the country is almost entirely cut off from the outside world, being compelled to depend for its communications on the single Transcaucasian Railway which passes through its territory from Batumi to Baku. The production of the 1800 industrial productive cooperatives in the Republic in 1927-28 amounted to 2,100,000 rubles with an investment in liquid capital of 300,000 rubles, as compared with a production by 600 cooperatives of 500,000 rubles with a capital of 100,000 rubles in 1926-27. The industrial cooperatives employed 97,700 artisans and handicraft workers in 1927-28 and 93,000 in 1926-27.

#### ARMIES See MILITARY PROGRESS

**ARTERIOSCLEROSIS AND HIGH BLOOD PRESSURE.** Dr. H. Dietrich of Magdeburg discussed this subject at a session of the local medical society on March 21 (see *Munchener medizinische Wochenschrift*, August 16, p. 1398). Mankind may be divided into three groups, the first being composed of individuals who never develop high blood pressure even in the most advanced years, in the second group high blood pressure does not appear until old age, while in the third, which is of chief interest to us, it may develop in middle years and even in early life. The explanation of hypertension is found in the middle coat of the arteries, for while a certain amount of decrease in the amount of muscle is natural with advancing years, the subject of hypertension undergoes instead an overgrowth. Save in cases which develop very early in life, there is a decrease in the muscle before the over-

growth replaces it. Thus, when hypertension develops late in life, the muscle in the middle coat of the arteries has diminished notably and has been replaced by ordinary connective tissue. When hypertension develops in arteries already weakened by this change into fibrous tissue, many secondary phenomena appear—fatty and calcareous degeneration, dilatation and elongation with tortuous course, participation of the inner coat with obstructive changes, etc., so that an extreme variety of pathological and clinical pictures results.

**FORCED EXPIRATION IN HIGH BLOOD PRESSURE.** Dr. I. Rapaport of New York has an article on this subject in the *Journal of the American Medical Association* for April 6. He has tested deep-breathing exercises in a few of these patients with encouraging results and these have been confirmed by Tiralla of Brunn, who has independently carried out this treatment in a large number of cases over several years. The author therefore hastens to release his experience for the benefit of the profession at large. Hyperventilation has of late years been tested on a variety of patients and normal individuals and is known to be able both to cause and remove pathological states. It is not necessary for the patient to breathe deeply, for the same result can be obtained by inhalations of carbonic acid gas. It has been partly shown that the opposite condition of hypoventilation, or defective ventilation, of the lungs is common in sedentary subjects with high blood pressure, so that a theory that forced breathing should benefit these patients is well grounded. Mere lack of sufficient oxygen in the blood cannot explain hypertension, for the oxygen content of the blood is a constant under all ordinary circumstances. An explanation of the value of forced breathing is at present difficult, but we have the experimental knowledge that the act of deep breathing for a short time will cause a sharp drop in the blood pressure.

**ART EXHIBITIONS.** One of the most important and significant exhibitions of the year was of modern French paintings, shown in November by the new Museum of Modern Art in New York in its first exhibition. The artists represented were Cézanne, Gauguin, Van Gogh, and Seurat. The examples selected were in general excellent, and made a very impressive showing. The Museum's second exhibition was of contemporary American artists.

The number of loan exhibitions in the United States was increasingly large, excellent groups of both old and modern masters were arranged in various sections, so that the opportunity of seeing good works of art was no longer confined to a few cities. One of the finest of these was the Detroit Museum's eighth annual loan exhibition of old masters, in March, of Van Dyck, a very representative selection of the artist's work. The Detroit Institute of Art also arranged an interesting exhibition of the Romantic, Realistic, and Barbizon schools, which afforded an excellent opportunity to study the period of French painting between the classic and impressionist. The Chicago Art Institute held an exhibition of old masters of many periods and styles. Other exhibitions held by various museums were eighteenth-century French painting at Hartford, Italian Baroque with emphasis on the Venetian at the Fogg Museum, Harvard University, an exhibition of ancient American art at the Toledo Museum similar to those held in the past in

Madrid, London, and Paris, and the first of its kind held in the United States, and an unusual exhibition of modern French, also at the Toledo Museum.

The exhibitions held in galleries in New York were numerous as usual, but the quality was comparatively not as high as in former years. There were, however, such exceptions as the extremely fine exhibition of Flemish primitives, one of the largest ever shown in the United States, and the exhibition of Venetian paintings in March, which included a self-portrait of Titian with an inscription definitely fixing the date of the artist's birth. An exhibition of eighteenth-century French art, remarkable as a whole, was particularly interesting for an unusual portrait of a woman by Watteau.

Other exhibitions of note were a collection of stained glass from the twelfth to the seventeenth centuries shown with very effective lighting, an exhibition of paintings of women and children by artists of the fifteenth to the twentieth centuries in which old and modern masters were hung side by side, a group of Italian primitives with rare twelfth-century work, and an exhibition of prints of the fifteenth and sixteenth centuries of unusual quality. Exhibitions of single artists included: "The Classical Period of Renoir," 11 pictures by this artist, some of them his best work, the largest collection of Modigliani ever shown in America, a representative loan exhibition of Lucas Cranach, and a group of water colors by Arthur B. Davies, brought to America after the artist's death.

The Eleventh Annual Exhibition of American Decorative Art, opening in February at the Metropolitan Museum, consisted of rooms designed by architects of note. It aroused interest in the American version of modern decoration and was on view for a longer period than was at first intended. The Metropolitan also held an international exhibition of glass and rugs, the annual exhibition of the American Federation of Art. Another exhibition held in New York, which attracted wide interest was the Russian Exposition, the first comprehensive showing of modern painting and sculpture from Soviet Russia.

Other interesting exhibitions were the Americana exhibition of glass, ceramics, and furniture, a loan exhibition of Chippendale pieces, and an anniversary exhibition of Daumier at the New York Public Library.

The summer art colonies at Newport, Stockbridge, Gloucester, and Lyme held their usual exhibitions. Among the societies exhibiting during the year were the Associated Dealers in American painting, which in its third annual exhibition attempted a larger scale, showing both European and modern paintings, the Society of Independent Artists, the Salons of America, the Whitney Studio Club, the New York Water Color Club, the Boston Society of Independents, the National Association of Women Painters and Sculptors, the New Society of Artists, and the American Society of Miniature Painters.

**CARNEGIE INSTITUTE PITTSBURGH** The Twenty-eighth International Exhibition of Paintings opened in Pittsburgh with representative works of 14 European nations. There were 392 paintings in all, 136 of these being by American artists and 256 from abroad. The Institute continued the plan adopted several years ago of inviting fewer artists and giving the public an opportunity to see a larger showing of each artist. The pictures were

hung in a separate gallery for each nation, an arrangement which gave the observer a good idea of national tendencies. The first prize of \$1500 was again won by a European, Felice Carena of Florence, Italy, for his painting called "The Studio." The same artist also received the Lehman award of \$2000 for the best purchasable picture in the exhibition; this award provides for the purchase of the picture chosen. The second prize of \$1000 went to William J. Glackens, a well-known artist of New York, for his painting, "Bathers, Ile Adam," and the third prize of \$500, to Georges Dufrenay of France for "Still Life with Violin." The first honorable mention with \$300 was given to Edward Bruce, an American; other honorable mentions were Joseph Pollet, American, Joan Junyer of Barcelona, and Max Beckman of Frankfurt. A special prize of \$300 offered by the Garden Club of Alleghany County for the best painting of flowers or a garden was won by Paul Nash of England for "Sea Holly."

**PENNSYLVANIA ACADEMY.** With the one-hundred-and-twenty-fourth annual exhibition, modernism has left its mark upon the Academy of Fine Arts. During recent years, the rather infrequent contributions of the radicals had little effect on the conservative front presented to the public. In this last exhibition, however, the work of the independents formed the predominant note, and the method of hanging, more by contrast than by consanguinity, emphasized their prominence. But, in spite of this, the list of prize-winners includes many names neither surprising nor new. The awards were made as follows: The Temple Gold Medal to Robert Henri for the "Wee Woman", the Jennie Sennan Gold Medal for the best landscape to Charles Buchheld for "Lilies", the Carol Beck Gold Medal for the best portrait to Richard Lahey for "Madame du Tarte", the Lippincott Prize for the best figure piece to Leopold Seyffert for "My Family", the Widener Memorial Gold Medal for sculpture to Bruce Moore for "Black Panther", the McClees Prize for group sculpture to Hallie Davis for "Baby and Snail." The traditional place of honor was given this year to a group of three paintings, "On the Heights," "After the Rain," and "Solitude," by the late Arthur B. Davies, who died in 1928 in Florence.

**NATIONAL ACADEMY, SPRING** In its one-hundred-and-fourth exhibition, the National Academy of Design seemed more at home in the liberal policy which it had deliberately adopted several years previously. The prize-winning pictures include an unusual number of landscapes. The First Altman Prize was awarded to William S. Robinson, who has received awards at several exhibitions in the United States, for his painting, "Borderland." The Second Altman Prize went to W. Granville-Smith for "The Mill Pond," also a landscape. This was the third time this artist had won an award at the National Academy Exhibition. Ethel Thayer of Boston received the First Hallgarten Prize for her painting of a nude, and Arthur Hill Gilbert of California, who had won several prizes in the West, the Second Hallgarten Prize for his landscape, "Old Oak—Monterey." The Third Hallgarten Prize went to Malcolm Humphreys, a new prizewinner, for "Fishing Fleet." Ettore Case, a Venetian, was given the Thomas B. Clarke Prize for his figure composition, "Fruits of the Earth." The Ellen P. Speyer Memorial Prize for painting or sculpture of animals was awarded to Furio Pic-

cirilli for his amusing black marble figure of a seal. The Isaac N. Maynard Prize for the best portrait was won by Ernest L. Ipsen for his portrait of Mrs. George Willoughby Maynard. The Saltus Medal of Merit went to Carl Kungus for "Wilderness."

**NATIONAL ACADEMY, WINTER.** The judges of this exhibition departed from their custom by awarding the Second Altman Prize to the "Fossil Hunters," a decidedly modernistic painting. The other awards, however, were made with the usual conservatism. They were as follows: the First Altman Prize, for a figure or genre subject, to Henry W. Watrous of New York for "A Medieval Saint"; The Carnegie Prize to Ivan G. Olinisky for "Soire Intime," the Thomas R. Proctor Prize for the best portrait to Gertrude Fiske of Boston, the Edwin Palmer Memorial Prize to Frederick J. Waugh of Provincetown for his seascape, "Full Tide"; the Isidor Medal for the best figure composition to Edmund C. Tarbell of Boston for "Margery and Little Edmund"; the J. Francis Murphy Memorial Prize for landscape to Arthur Hill Gilbert of California; the Helen Foster Barnett Prize for the best piece of sculpture to Mitchell Fields, the Julia A. Shaw Memorial Prize for the most meritorious work by an American woman to Edith Mitchell Piellwitz.

**ART INSTITUTE, CHICAGO.** The forty-second annual exhibition of painting and sculpture opened with a large and representative group of works. The institute continued its attention to the young Americans, but the general tone of the exhibition was little changed. The prizes were awarded as follows: The Logan Gold Medal and Prize of \$2500 to Alexander Brook for "The Children's Lunch"; the Logan Silver Medal and \$1500 to John Storrs for his bronze sculpture, "Two Figures"; the Palmer Gold Medal and Prize of \$1000 for painting or sculpture to Evelyn van Norman for "Boy Reading"; the Logan Medal and Prize of \$1500 to Sylvia Shaw Judson for her sculpture "Little Garden"; the Norman Watt Harris Medal and Prize of \$300 to Eugene Higgins for "The Storm"; the H. V. Kohnstamm Prize of \$250 to Henry Lee McFee for "The Bianch"; the Peabody Prize of \$200 to Davenport Griffin for "Deep Woods"; the Martin B. Cahn Prize for the best painting by a Chicago artist to Tunis Ponsen for "Fishing on the Siene"; the William M. R. French Gold Medal to Paul Trebilcock for "Chiarina." The following received Honorable Mention: Architectural subject, Paul Beiman for "Tearing Down"; Harry Gottlieb for the "Roundhouse"; figure subject, Lotan Welshans for "Sleep"; sculpture, Walter Zschorsch for "Work."

**EUROPEAN EXHIBITIONS** The most important exhibition of the year 1929, a loan exhibition of Dutch Masters, was held in London at Burlington House. The dominant figures of the collection were Rembrandt, Hals, and Vermeer, of whom many fine examples were shown, and the emphasis was in general laid upon the universally acknowledged masters rather than upon the primitives or the development of the school as a whole, the earlier phases of the art of the Low Countries having been well covered by the Flemish exhibition two years previously. This exhibition was, as far as attendance was concerned, the most successful exhibition ever held anywhere. Supplementary to this exhibition, the National Gallery placed on view about 50 Dutch paintings usu-

ally not shown. Among other noteworthy exhibitions in London were a loan collection of old English silver, one of the finest ever assembled, and a loan exhibition of English decorative and domestic arts.

The interest in various countries in studying the art of other nations and the growing opportunities for such study was very evident during the year. A large and important exhibition of modern French art was held in Brussels, an exhibition of modern Swedish art in Paris, the Kroll-Muller collection of Van Gogh, the most comprehensive collection of this artist, and a group of 100 works by Derain were shown in Berlin. The exhibition of Russian icons from the twelfth to the eighteenth centuries, shown in Berlin by the Soviet State, was another example, as was of course, the exhibition of Dutch paintings in London.

One of the most interesting European exhibitions was that arranged in Berlin by the East-Asiatic Society, the first comprehensive survey of Chinese art shown in Europe, which included a remarkable collection of archaic sacrificial bronzes. Other notable exhibitions were in Paris, 126 paintings from the collection of Paul Guillaume, many of these shown to the public for the first time, an exhibition of works pertaining to the theatre of the seventeenth and eighteenth centuries, and excellent showings of Coubet and Hubert Robert, in London, a group of drawings of old masters, and an exhibition of Maya relics at the British Museum, intended to stimulate interest in another expedition to British Honduras, in Venice a loan exhibition of seventeenth-century Venetian art gathered from many countries, and in Berlin an exhibition of Leibl.

**ART MUSEUMS.** The Museums of the United States during the year 1929 have continued their usual activity in adding valuable works of art to their collections and in addition showed numerous advances in broadening these collections, developing new methods, and in general increasing the opportunities of the public for enjoying art. An important event of the year in the world of museums was the opening in November of the new Museum of Modern Art in New York City. America has been gradually acquiring a keen interest in modern art, and museums could naturally not be expected to keep abreast of the times to the extent many people desired. The need of an "American Luxembourg," a purgatory from which a permanent collection could be chosen, was met by the founders of this new museum. It was established temporarily in the Heckscher Building, where two excellent exhibitions were held during the autumn.

Another important event was the opening of the Rodin Museum in Philadelphia. It was given by Julius E. Mastbaum, and is a reproduction of the Rodin Musée at Meudon, France. The building, in an attractive setting on the Parkway near Twenty-first Street, is of white limestone brought from France, and is 100 feet by 80 feet. The interior consists principally of a rectangular gallery with a skylight and mural decorations by Franklin C. Watkins. Outside the building are exhibited "The Thinker," "The Shadow," "Adam," "The Age of Bronze," "The Burghers of Calais," and "The Gates of Hell." The collection of Rodin's work is remarkably varied and

complete; it consists of 83 bronzes, 39 plaster casts, 2 bas-reliefs, 64 drawings, 177 original letters, and other documents connected with the sculptor.

The most important event at the Metropolitan Museum of Art was the bequest of the H. O. Havemeyer Collection of paintings, both modern and old masters, one of the finest in the United States. The collection, not shown to the public up to the end of the year, was to be exhibited as a whole, and a new wing was to be built to contain it. Other additions to the department of paintings were the "Madonna and Child," by Luca di Tommé, the "Judgment of Paris," by Lucas Cranach, a portrait of James Munroe, by Gilbert Stuart, and a group of Italian Baroque paintings. A very important acquisition in the classical department was a statue of Protesilaos, a Roman copy of a Greek work of about 450-440 B.C., the only extant statue of this hero. A new classical study room was opened, with both genuine examples of ancient sculpture and forgeries for purposes of comparison. Accessions in other departments include the "Descent from the Cross," by Jean Goujon, a French marble relief of the sixteenth century, a Spanish Gothic ceiling of the fifteenth century, a torso by Maillol, two valuable Chinese paintings, and a model of the city of Nuremberg as it was in 1025, presented by the Friends of German Art, as well as many interesting Egyptian objects discovered by the Museum's Expedition as a result of excavations at Dier el Bahi.

The Pennsylvania Museum announced the remarkable gift by an anonymous donor of a fund to establish a collection of Romanesque art. The principal features of this collection are the front of a Burgundian abbey-church and a Catalan cloister from the Church of Saint-Genis-des-Fontaines, an abbey in the Pyrenees. Part of the fund was set aside for the purchase of armor, sculpture, and other examples of Romanesque art. The growing interest in furniture and the decorative arts was well shown by this museum's recent acquisitions of period rooms: a Venetian Gothic room from the Soranzo Palace, a Louis XVI room from the Hotel Letellier, with fine examples of carving and decoration, a Dutch seventeenth-century room from an ancient brewery in Haarlem, a German Renaissance room, and a French Gothic room. Another important gift was 300 Chinese paintings and a superb Chinese Palace Hall in which to exhibit them. Other acquisitions include a Beauvais tapestry, an early Buddhist sculpture, an excellent study collection of more than 700 specimens of English Gothic wood carving, a Chippendale wing chair from the Reifsnnyder collection, and two important paintings by Arthur B. Davies.

The Museum of Fine Arts in Boston received a bequest from George Nixon Black of \$150,000 for the general purposes of the museum, the income from a residuary estate of \$1,000,000 and a number of paintings and other works of art. An interesting addition to this museum was a Gothic tapestry, about 1490, representing six scenes from the Passion, which formerly hung in the Chapel at Knole, the estate of the Sackville family. Other additions were an important seal from the Indus Valley, four Andhra sculptures, a good example of early Cambodian sculpture, 287 charcoal and pencil drawings by Sargent, presented by the artist's sister, a portrait of Robert Hay, by Raeburn, "Cupid at the Toilet of

Venus," and "Venus Chastising Cupid," by Etienne-Maurice Falconet.

The Detroit Institute of Arts acquired a fine Chinese scroll painting, "A Peasant Family," by Mathieu Le Nain, the "Madonna and Child," by Tiepolo, an interesting example of early Chinese bronze sculpture, a Dutch interior by Hendrik van der Burch, "The Birth of Love," attributed to Giacomo Bassano, a portrait by Moroni, a bust by Giovanni della Robbia, a bronze head by Maillol, and a portrait of a man by Van Dyck.

The Cleveland Museum made the following additions to its collections: an Assyrian relief of the time of Assurnasirpal III, a fine Gothic wood carving of Christ and Saint John the Evangelist, a brocade from Lucca, Italian with Chinese influence, a painting of Minerva by Strozzi, and a life-sized statue of a Roman statesman.

The Art Institute of Chicago added a number of interesting objects, including a Tang head in dried lacquer, probably a representation of a Buddhist priest, a fifteenth-century Gothic tapestry of a bear hunt, a late Greek relief, and a painting by Segonzac.

The Fogg Museum opened a new gallery of drawings and paintings with work by Degas, Matisse, and Picasso. Among the recent accessions of this museum are embroideries, etchings by Goya and Canaletto, prints by Duier and Holbein, and a 3000-year-old censer from Iraq.

The Rochester Museum received by gift a collection of Egyptian and Greco-Roman antiquities and a Madonna and Child of the school of Donatello, a beautiful example of sculpture in bas-relief. Other new additions were a fourteenth-century Gothic Madonna of the school of the Ile-de-France, "Saint Stephen," by Domenico Feti, early seventeenth-century, a fifteenth-century illuminated manuscript, and three pieces of thirteenth-century French stained glass.

The Toledo Museum of Art acquired by purchase Claude Monet's well-known painting, "Antibes." Its most important accessions included two Gothic sculptures, the "Bull Fight," by Goya, and a portrait of Elizabeth of Valois, by Francois Clouet.

The Gallery of Living Art at New York University added to its collection of modern art "Portrait of Matisse," by Derain, "Jungle Scene," by Dufresne, "Still Life," by Roget de la Frenaye, "Banks of the Oise," by Vlaminck, and "Still Life," "Abstract Composition," and "Portrait of the Painter," by Picasso, as well as many other important pictures.

The Museum of the City of New York received a unique collection of prints, paintings, and photographs illustrating the history of New York over a period of 300 years. The Minneapolis Institute of Arts opened a new gallery of classical art. The city Art Museum of St. Louis acquired an important painting by Pieter de Hooch, "A Game of Skittles," and a portrait of Henry Addington by John Singleton Copley. The Carnegie Institute, Pittsburgh, opened the Daltzell Memorial Gallery of 36 paintings of Italian, English, Spanish, and German schools. The Wade-worth Athenaeum and Morgan Memorial in Hartford acquired a valuable tempera panel, a head of an angel, by Fra Angelico. The Princeton University Art Museum made the following additions: a colored terracotta of the Tang dynasty, a portrait by Moroni of Brescia, a large painting of the Ming dynasty, and a fourteenth-century Castilian "Last Supper."

VIEW OF THE MAIN EXHIBITION ROOM WITH RODIN'S "KISS" IN CENTRE FOREGROUND

ENTRANCE PORTAL  
RODIN MUSEUM, PHILADELPHIA

Large crowds congregated to see the sale of this famous vase, but it was later withdrawn when the bidding failed to meet the owner's reserve.

The sale in Paris of M. Emile Straus's collection of modern paintings, drawings, and sculpture attracted collectors from many parts of the world. The following were some of the works sold: "Danat," drawing by Fragonard, 500,000 francs; "Masque de Voltaire," pastel by La Tour, 245,000 francs; "Bias de Seine, près Giverny, à l'aurore," by Monet, 265,000 francs, "L'inondation," by Monet, 203,000 francs, "Still Life," by Monet, 281,000 francs; "Le Défenseur à la Barra," india-ink drawing by Daumier, 150,000 francs, pastel of a young woman, by Renoir, 60,000 francs.

One of the most interesting sales of the year was that held at Osaka, Japan, of the collection of Chinese and Japanese works of Baron Fougita, the best-known art collector in Japan. The total amount of the sale was about \$1,400,000. Some of the objects sold and their prices are as follows: Chinese landscape painting by Hsia Kuei, \$69,500; Japanese landscape painting by Mokubei, \$40,000; pottery tea jar, \$34,955; Korean tea bowl, \$24,555; water jar, \$15,000; and Sung celadon *koro*, \$16,950.

Other important sales of the year were The Paulme collection of French eighteenth-century drawings and pastels, with a total of \$435,600; the collection of Emil Weinberger, chiefly of works of the Renaissance, with a total of \$205,000; and Baron de Cosson's collection of armor, \$10,200, the latter interesting because the owner was one of the most famous authorities on armor.

Notable single sales of the year included Portrait of Elizabeth, Duchess of Sutherland, by Romney, sold by the Duke of Sutherland to an American collector for a reputed price of more than \$250,000, the entire collection of Philippe Wiener of old masters and furniture, sold to an American dealer for \$800,000; a tapestry from Knole, the estate of the Sackville family, and one of the Sackville portraits, both destined for American collections.

**ASTRONOMY.** It has long been suspected that the displacements of the lines in the spectra of spiral nebulae are not due entirely to motion in the line of sight; for these displacements are almost invariably toward the red, and would require extraordinarily high velocities if they were produced by the Doppler effect. After the enormous distances at which the majority of the spirals are located became known, it appeared probable that part of the displacement is an effect of distance, and a statistical study of the observations which have now been accumulated has shown that the amount of the shift is indeed correlated with distance. Nebulae which are known to be the more remote give the larger shifts; the farther away a nebula, the faster it seems to be receding from the observer.

An empirical relation between distance and line-displacement has been deduced by Hubble from the known approximate distances of twenty-four extragalactic nebulae; for every million light years of distance, the apparent velocity of re-

cession increases by nearly 100 miles per second. According to this relation, the displacement in the case of N. G. C. 7619 (which corresponds to a recession of 2400 miles per second when corrected for solar motion relative to the spirals) indicates a distance of approximately 25 million light years, in good agreement with the estimate from diameter and brightness. It thus appears possible to estimate roughly the distance of a remote object from the apparent Doppler shift; Hubble estimates the Virgo cluster to be 6,500,000 light years distant, though by other methods Shapley has obtained 10,000,000. Some of the faint nebulae in Coma Berenices, recently observed by Humason with the 100-inch reflector, probably lie 50,000,000 light years away.

The cause of the undoubted and marked increase in apparent radial velocity with distance is uncertain. The Theory of Relativity indicates that such an effect should exist, but in its present form this theory does not afford an altogether satisfactory explanation of the known facts.

See *Proc. Nat. Acad. Sci.*, 15, 167-173, 1920, *Astrophys. Jour.*, 69, 245-274, 1920.

**EXTRAGALACTIC UNIVERSES.** The extragalactic nebulae, or "island universes," of which hundreds of thousands exist in the oceans of space, have been found to be organized into great systems—clustered into galaxies of galaxies. A region in Virgo and Coma Berenices, especially rich in nebulae of the type that Hubble's researches had marked out as external to our own galaxy, has been found by Shapley and his colleagues to contain several such clusters of universes. The nearest of the Coma-Virgo groups consists of between 200 and 300 members and is estimated by Shapley to be 10,000,000 light years distant and to extend through 2,000,000 light years of space, the individual systems in the organization have diameters of from 5000 to 20,000 light years. Statistical relations between apparent size and brightness, established with the aid of nebulae of known distances, are especially applicable when nebulae are thus grouped into clusters, in this way, Hubble has estimated the distance of a group of 800 galaxies in Coma Berenices to be 50,000,000 light years.

Our own galaxy appears to have a diameter from ten to twenty times as great as that of any of the others with which we are acquainted, with the exception of the Andromeda nebula which is about one-fifth the size of our system. The Andromeda spiral, some of the brightest of the other neighboring spirals, the Magellanic Clouds, and our own galaxy, may together form a local cluster somewhat similar to the other groups which we observe in the northern sky.

**TRANSPARENCY OF SPACE.** The existence of remote blue stars, and of negative color indices in globular clusters and distant nebulae, show that no appreciable selective scattering or absorption of light (like that which takes place in our atmosphere) occurs in interstellar space, except of course in certain regions where obscuring nebulosities are known to lie. If, in addition, scattering or absorption independent of the color is also negligible, so that space is completely transparent, then the angular diameters of objects of the same size should vary with their apparent magnitudes according to a known mathematical law. The theoretical relation between angular diameter and apparent magnitude is approximately satisfied in the case of globular clusters, which indicates that the nearer re-

gions of space are effectively transparent, although the clusters are not very satisfactory objects for a test, because the observational measurements are affected by a number of sources of uncertainty. A much more conclusive test is possible on the extragalactic nebulae, the uncertainties attaching to individual nebulae are largely eliminated by using all the members of a large cluster.

A study by Shapley of the 2775 nebulae in the Coma-Virgo clouds has shown that space in this direction is effectively transparent through at least 100 million light years, and this is not inconsistent with what is known of the distribution of meteors and other interstellar matter. On the average, faint nebulae which send 1 per cent as much light as those of the brighter groups have an apparent diameter 10 per cent as great, which is what we should expect if space is transparent and if the nebulae average up to the same size; if space were hazy, more distant nebulae would look fainter but no smaller.

The interstellar material responsible for the fixed lines in stellar spectra is estimated by O. Struve and Gerasimović to have a density of about  $10^{-26}$ .

**COSMOGONY** A collision between the sun and a passing star has often been suggested as the origin of the solar system, but in recent years tidal disruption due to a close approach has been more generally adopted as the probable origin. Jeffreys has shown, however, that on the basis of the tidal theory there is difficulty in accounting for the observed rates of rotation of the planets and for the diameters of the satellites, and he has suggested for the origin of the system a glancing collision.

As the two stars, each in a fluid condition, slid over one another, a layer of matter of about 1/500 the mass of the sun would be swept off the outside and would form an elongated ribbon stretching between the two bodies. This filament would be unstable, and would break up into fragments in a few hours. The whole process of ejection would occupy about an hour, the ejected masses of gas would undergo rapid adiabatic expansion, and quickly liquefy. The planetary nuclei would gather up the other matter, and liquid planets and satellites would be formed, the nucleus of the earth probably became liquid in about a day, that of Jupiter in a week. The changes after liquefaction would be much slower. See *Mon. Not. Roy. Ast. Soc.*, 89, 636-641, 731-738, 1929.

**ASTROPHYSICS** The physical theory of stellar spectra and stellar atmospheres, as constructed on the basis of the pioneer work of Saha, has been greatly extended, generalized, and improved in recent years, particularly through the investigations of E. A. Milne, and many of the observed details of celestial spectra, including some of those used in the empirical determination of parallaxes, are rapidly receiving satisfactory theoretical explanations. The recent developments in the atomic theory of spectra are leading to an understanding of the processes by which spectral lines are produced in stellar atmospheres sufficient to form a basis for a realization of the long-standing hope that quantitative spectrum analysis of stellar atmospheres might become possible. See *Phil. Trans. Roy. Soc. Lond.*, 228, 421-461, 1929.

The extranuclear electrons in an atom of any given chemical element are bound to the atom

with differing degrees of firmness, and they may happen to be arranged in any one of various different configurations, each of which corresponds to a certain state of energy of the atom. Spectrum lines are emitted or absorbed when an atom changes from one energy state or "level" to another, the rules governing such transitions, and principles by which the appearance of the resulting spectra may be determined, are now well known although their theoretical explanations are not in all cases clear. Line spectra no longer present a hopeless maze to the physicist, the structure of even the most complex spectra is rapidly being deciphered, and the lines sorted out and classified into regular series. With the aid of the theory of the production and relative intensities of the various arc and spark lines under different conditions of excitation and ionization, we can interpret the details of celestial spectra and understand the significance of the presence or absence of recognizable lines in the case of each of the elements, and the physical theory is a valuable guide in attempts to identify additional lines. Both line-contours and line-intensities may be used to determine the actual number of atoms of any given element in a specified state of excitation or ionization above various levels in the solar atmosphere.

The solar spectrum has been photographically mapped to wave length 11,630 Å. Plates stained with neocyanine were used in the infra-red. There are 21,835 recorded lines, of which 3288 have been identified as due to iron, 1069 to titanium, 1027 to chromium, 783 to cobalt, 628 to nickel, and 610 to vanadium, altogether, nearly 13,000 have been identified. The spectra of Mn, Re, Po, Ac, Pa, Rn, H, Th, U, Tu, and Lu have not yet been sufficiently studied in the laboratory to permit any investigation of the presence of these elements in the sun. Of the remaining 70 known elements, 49 have been found in the sun with certainty, 9 are doubtful, and 21 have not been found, 18 have both arc and spark lines in the solar spectrum, 22 show arc lines only, 7 show spark lines only, while boron and nitrogen show primarily in the band spectra of compounds.

The principal factor unfavorable to the appearance of a spectral line is a high excitation potential. The elements which fail to appear in the solar spectrum fall into two groups: (1) Those with atomic numbers up to 54, together with gold and mercury, the excitation potentials of which are so high that there is little or no chance of lines appearing unless the substances are present in extreme abundance, and also cesium, of which the first ionization potential is so low that no neutral atoms remain even above sun spots, while the second is so high that observable lines would require prohibitive excitation, (2) heavy metals, the absence of whose lines can be explained only by concluding that these elements are present in the reversing layer in very small quantities, if at all.

It has long been recognized that the elements which show very strong lines must be particularly abundant in the solar atmosphere. The line-intensity is proportional to the square root of the number of atoms in the state of excitation necessary to produce that line. The lines decrease gradually in blackness from the centre outward, fading into the continuous spectrum, microphotometric measurements of the gradation in intensity permit the calculation of the number of

atoms at work producing the line, Unsöld thus finds, e.g., that  $2300 \times 10^{16}$  atoms are at work above each square centimeter of the solar surface in the production of the H and K lines of calcium, only  $3.4 \times 10^{16}$  neutral calcium atoms are present. For weaker lines, the theory of multiplets, as used by Russell, Adams, and Moore in connection with a calibration of Rowland's conventional scale of intensities, provides a quicker method of calculation.

Russell's calculations show that the six metals, Na, Mg, Si, K, Ca, and Fe, contribute 95 per cent of the whole mass of the sun's atmosphere, the total number of metallic atoms above a square centimeter is  $8 \times 10^{20}$ , of which 80 per cent are ionized. The elements of even atomic number average ten times as abundant as those of odd atomic number. There is no evidence that the heaviest elements sink below the photosphere. Russell estimates the solar atmosphere to consist of 60 parts by volume of hydrogen, two parts of helium, two of oxygen, one of metallic vapors, and 0.8 of free electrons. The almost incredible abundance of hydrogen helps to explain a number of previously puzzling astrophysical facts. The temperature of the reversing layer is estimated to be  $5600^\circ$ , and the pressure at its base is 0.005 atmosphere. See *Astrophys Jour* 70, 11-82, 160-174, 1929.

An analysis of the structure of the atmospheric oxygen absorption bands in the solar spectrum has led to one of the most important discoveries of recent years, viz., that the molecule of oxygen exists in three different forms, involving isotopes with atomic weights 16, 17, and 18. The discovery of this important fact of chemistry came about through the application of modern theoretical physics to the interpretation of astronomical observations at Mount Wilson, and is an excellent illustration of the intimate relations now existing between physics, chemistry, and astronomy.

Russell and Bowen have concluded that Freeman's supposed identification of coronium with argon is without foundation. Observations of the rate of cooling during an eclipse indicate the lunar surface to be composed of porous material such as pumice or volcanic ash.

**STARS.** A recent analysis by J. Schilt of the great mass of data now available pertaining to proper motions and radial motions has confirmed the real existence of two great star streams, as against the preferential motions of Schwarzschild's ellipsoidal theory. The stars in general, to the tenth visual magnitude, appear to be divided into two streams of which the points of convergence are in Orion and Canis Major, these however, do not coincide with the streams of Kapteyn's theory.

By means of an improved radiometer, the vanes of which are cut from house fly wings and the entire suspension of which weighs only  $3/100,000$  ounce, Abbot has obtained, with the 100-inch reflector, the energy spectra of stars as faint as the 3.8 magnitude.

The theory of the mechanical equilibrium of stellar atmospheres has been extended by Rosseland and McCrea to include turbulence. In the presence of the virtual viscosity due to turbulence, radiative viscosity ceases to have any important effects.

**COMETS AND METEORS.** Up to the end of 1929, about 900 comets had been observed, including the different returns of the periodic ones; it has

been estimated, however, that the number of comets within the orbit of Neptune at any one time is probably about 8000, while the total number having their perihelia within the same limit must amount to millions. The majority of those which have been observed have orbits that do not differ sensibly from a parabola, but the probability of a comet being seen depends not only on its intrinsic brightness but also on its movement, and orbits with a large major semi-axis must necessarily be almost parabolas in order that the comet may be observed at all. As the precision and the duration of the observations increase, the percentage of parabolic orbits steadily diminishes, but with one or two possible exceptions, none of the comets yet observed has approached the sun in a hyperbolic orbit, though in some cases planetary perturbations have afterward changed the orbit to a hyperbola.

In spite of the fact that all comets probably move in ellipses, and do not come from interstellar space, there are serious difficulties in regarding them as permanent members of the solar system. One of the best-determined orbits—that of 1914 V Delavan, under observation for 629 days—had a major axis of 170,000 astronomical units, and a period of 24 million years, comets with such orbits would be affected by perturbations due to the nearer stars, though it has been shown that they would not be lost to our system. The primeval matter of comets must have extended well out toward the stars, furthermore, hyperbolic comets may once have existed, but would now have disappeared into space. While comets with periods less than 1000 years have their perihelia concentrated near that of Jupiter and their fundamental plane near the plane of the ecliptic, the longer period comets have their fundamental plane in the plane of the Milky Way and the disposition of their orbits is related to the vertex of stellar motions. An extrasolar origin and a participation in stellar drifts are thus indicated for the long-period comets, the short-period ones have been more thoroughly assimilated into the solar system, and have lost their original characteristics—there is evidence that they sometimes ultimately become minor planets. Furthermore, comets are unstable bodies, and are continuously disintegrating and dissipating, there is evidence that their probable age is not over a million years, a very small fraction of the age of the solar system, yet there is no influx of fresh comets from the depths of the universe to keep up the supply.

Bobrovnikoff has therefore suggested the hypothesis that comets were acquired by the solar system about a million years ago while the system was passing through a region of space (probably in the vicinity of Orion) filled with meteoric material, they are now gradually disappearing. This hypothesis explains the absence of meteoric material from the geologic strata; and it is supported by the fact that there is a definite relation between the distribution of brightness among the various periodic comets and their orbital elements. See *Jack Obs Bull*, No 408, 1929.

About 100 of the comets have been observed spectroscopically. The spectra are those to be expected if the cometary head be composed of meteorites, nine lines, all of which appear only at small heliocentric distances, remain unidentified. See *Jour Roy Ast Soc Can*, 23, 55-89, 1929.

#### SUN SPOTS

PHOTOGRAPH MADE ON NOV 10 1929, BY PROF G. H. PETTER AT THE U. S. NAVAL OBSERVATORY WASHINGTON, AND SHOWING AN UNUSUALLY LARGE NUMBER OF SUN SPOTS. THE LARGEST SPOT IN THIS ROW OF SPOTS WAS IN JANUARY WHEN THE PHOTOGRAPH WAS MADE. THE LONG ROW OF SPOTS COVERS ABOUT 1,000,000 MILES ON THE SUN'S SURFACE.

Science Service Photo

#### 200 INCH TELESCOPE MODEL

PHOTOGRAPH OF TENTATIVE MODEL OF 200 INCH TELESCOPE UNDER CONSTRUCTION FOR THE CALIFORNIA INSTITUTE OF TECHNOLOGY. THE MODEL WAS EXHIBITED BY THE CALIFORNIA INSTITUTE OF TECHNOLOGY AT ITS MEETING FOR THE NATIONAL ACADEMY OF SCIENCES IN WASHINGTON IN WASHINGTON IN NOVEMBER 1929. THE FIGURES IN THE FOREGROUND INDICATE THE LARGEST SIZE OF THE TELESCOPE AND ITS MOUNTING.

**MISCELLANEOUS** Plans for the projected 200-inch reflecting telescope were rapidly being completed during the year. They contemplated a tube 60 feet long and over 20 feet in diameter. The total weight of the instrument will be 450 tons, and that of the moving parts, 200 tons, the mirror, consisting of a layer of clear fused quartz on a base of melted quartz sand, will be 3 feet thick and will weigh nearly 30 tons. When pointed near the zenith, the whole instrument will have a height of 85 feet, about that of a seven- or eight-story office building.

The building and mounting for the 61-inch reflector of the Perkins Observatory of Ohio Wesleyan University were completed, the mirror, cast at the U. S. Bureau of Standards, was being figured. A 60-inch mirror for the Harvard Observatory station at Bloemfontein, South Africa, was completed. South Africa is rapidly becoming one of the world's greatest astronomical centres, six large observatories were located there by 1929, and three more were being planned.

A 50-foot interferometer has been completed at Mount Wilson, after nearly eight years in construction. A beam 50 feet long carries a flat mirror at each end, these mirrors reflect light from a star to the centre of the beam, where two additional mirrors reflect the light to a concave mirror that brings the rays to a focus. The two rays produce interference fringes, by sliding the mirrors along the beam until the fringes just disappear and then measuring their distance apart, the angular diameter of the star can be calculated, and from this the diameter in miles can be found if the distance of the star is known.

The first of the famous Zeiss planetariums to come to America has been presented to the city of Chicago by Max Adler, this instrument, by projecting the stars and the bodies of the solar system on the interior of a dome, portrays, in an accurate and inspiring way, the heavens and all the phenomena arising from the motions of the celestial bodies.

**ASTRONOMICAL PHENOMENA** The total solar eclipse of May 9 in the East Indies was successfully observed by several of the expeditions sent out, the totality lasted over five minutes at some places. There were four comets discovered during 1929, besides one unconfirmed object, the first was possibly a return of 1894 Denning. Comet 1928 III proved to be identical with 1818 I Pons and 1873 VII Coggia Winnecke. The peak of the sun-spot cycle was apparently reached with an extensive display of gigantic spots in November.

**ATHLETICS, TRACK AND FIELD** Although the year following an Olympic meet is usually without any thrilling incidents in track and field events, the year 1929 was different and provided several performances which again showed the United States supremacy. It was a year of sprinters despite America's failure to accomplish anything of note in the sprint events of the Olympic games. Half a dozen speed kings touched 9½ seconds for the 100-yard dash, while George Simpson of Ohio State University was timed for the distance in 9½ seconds. His record was made with the use of starting blocks, however, as was his mark of 20½ for the furlong. Other outstanding sprinters include Eddie Tolan, Michigan, Claude Bracey of Rice Institute, Charley Borah of southern California, and Frank Wyckoff of Glendale, California.

The indoor season, which as a general rule provides most of the thrills of the year, again was replete with sparkling middle-distance running. Phil Edwards, Johnny Gibson, Eddie Blake and Bernie McCafferty all bettered the mark of 1:13 for the 800-yard event, while Ray Couger ran the mile indoors in 4:13½, beating Leo Lermond, Edwin Wide of Sweden, and Eino Purje of Finland. Lermond developed amazingly, however, and became the year's champion by overthrowing Conger at the Yankee Stadium in 4:13, second to the fastest time ever registered for the mile in the United States.

The year was notable for excellence in the field events and particularly in discus throwing. Eric Krenz of Stanford University gained the greatest renown by setting a new world record for the toss, 163 feet 8½ inches. He also won the national championship and the intercollegiate title. In the N. C. A. A. games, all six finalists exceeded 150 feet. Fred Sturdy of Yale took pole vaulting honors, grasping the crown worn by Sabin Carr the year previous. The New Haven student was invincible, winning the national indoor and outdoor title, the indoor intercollegiate title, as well as tying for the outdoor collegiate crown. Dick Rockaway of Ohio State and Steve Anderson received recognition for work in the hurdle events.

For the third successive year, the Stanford University athletes dominated the outdoor intercollegiate and took the title to the West coast. In the indoor I. C. A. A. A. event, the New York University squad captured first honors for the first time in the history of the university. Phil Edwards of N. Y. U. was the individual star of the team, wiping out Meridith's intercollegiate half-mile record and setting the mark at 1:52½. He also captured the national A. A. U. half-mile race. **AUER, KARL, FREIHERR VON WELSBACH** An Austrian scientist and inventor, died Aug. 5,

1929, at Welsbach Castle, in Carinthia, Austria. He was born in Vienna, Sept. 1, 1858, the son of a printer who was himself the inventor of several devices important for printing and paper making. Karl von Welsbach studied under the chemist Bunsen at the University of Heidelberg, where his research in the chemistry of rare minerals had important results. His invention of the incandescent mantle for gas lamps in 1885 led to the formation in 1890 of the company of Auer-gesellschaft to manufacture under the Welsbach patents. This company, of which Karl von Welsbach was president, had large chemical works at Treibach. In 1897 he invented the osmium filament lamp, and six years later the ferro-cerium compound used in the manufacture of pocket lighters. He held membership in the scientific academies of Vienna, Berlin, and Stockholm and in various other technical societies.

**AULTMAN, BRIGADIER GENERAL DWIGHT EDWARD** American army officer, died Dec. 12, 1929, in Washington, D. C. He was born in Allegheny, Pa., Feb. 2, 1872, and was graduated in 1894 from the U. S. Military Academy. The same year, he was commissioned second lieutenant in the Fourth Cavalry, and was promoted through the grades to the rank of colonel in 1917, and of brigadier general in 1921. He served in the Spanish-American War (1898), and the following year returned to Cuba, first as aide-de-camp to General Wheaton, and then to General Keifer. He organized and commanded the Cuban Artillery in 1901-02, was an instructor of the same army during 1903-06, and was on the staff of the commanding general of the Army of Cuban Pacification in 1906-07. From 1907 to 1911, he was an instructor in the department of languages in the Service Schools of Leavenworth, Kans. At the outbreak of the World War in 1914, he was sent to the German front as a military observer, but the following year was recalled to enter the Army War College, from which he was graduated in 1916, and at which he became an instructor in 1916-17. He commanded the 5th Field Artillery, the 1st Division, A. E. F., in 1917-18, and in 1918 commanded the 51st Brigade of the Field Artillery of the 20th Division. Later in the same year, he was appointed chief of Artillery for the 5th Corps, and yet later, of the 2nd Army. For his services, General Aultman was awarded the Distinguished Service Medal of the United States, the Croix de Guerre of France, and was made commander of the Legion of Honor. He wrote *Military Strength and Resources of the U. S.* (1917).

**AURORA.** See **PHYSICS**.

**AUSTIN, CHELLIS A** American banker, died Dec. 13, 1929, in Montclair, N. J. He was born in West Berkshire, Vt., in 1876, and was educated at St. Lawrence and Columbia universities. At first a messenger in a broker's office, in 1898 he became a clerk in the president's office of the Erie Railroad, remaining in this position until 1911, when he became trainmaster of the Jersey City Terminal Division on the Lehigh Valley Railroad. He entered the Columbia Trust Company in 1911 as a solicitor of new business, and was steadily promoted. In 1917 he was elected president of the Mercantile Trust Company, and when this company merged with the Seaboard National Bank, he became president of the new Seaboard National Bank. When this company in turn was consolidated with the Equitable Trust Company in 1920, Mr. Austin again became president of the new company. He was also director of

a number of organizations and actively interested in charitable and educational institutions.

**AUSTRALASIAN METHODIST CHURCH.** See **METHODISTS**.

**AUSTRALIA, COMMONWEALTH OF.** A self-governing dominion of the British Empire, consisting of the six original states (formerly colonies) of New South Wales, Victoria, Queensland, South Australia, Western Australia, and Tasmania, together with the Northern Territory and the Federal Territory, and comprising the island continent of Australia with its dependencies. The present Commonwealth dates from its proclamation in 1901, under the Act of Union passed in the preceding year. Of the divisions mentioned above, the Northern Territory was transferred by South Australia to the Commonwealth; and the Federal Territory consists of a former portion of New South Wales. At the beginning of 1927, the seat of the government was at Melbourne, but on May 9, 1927, the new capital at Canberra was formally opened by the Duke of York.

ESTIMATED POPULATION OF AUSTRALIA ON JAN. 1, 1929

States and Territories	Males	Females	Total
New South Wales	1,246,234	1,199,046	2,445,280
Victoria	875,449	885,515	1,760,964
Queensland	485,290	431,899	916,689
South Australia	298,679	279,669	578,348
Western Australia	220,209	185,664	405,873
Tasmania	107,371	109,192	216,563
Northern Territory	2,739	1,243	3,982
Federal Capital Territory	4,564	9,521	8,087
Totals	3,241,595	3,095,251	6,336,786

**AREA AND POPULATION.** The area of Australia is 2,974,581 square miles, the population, according to the census of Apr. 4, 1921, was 5,433,734, while on Jan. 1, 1929, it was estimated by the Commonwealth statistician as 6,336,786, an increase of 101,932, as compared with the total 12 months previous. The figures indicate that since the census of Apr. 4, 1921, the population increased 901,052, about 70 per cent of which was accounted for by the excess of births, and 30 per cent by the excess of arrivals over departures. The average rate of increase of population in the Commonwealth was slightly more than 2 per cent per annum. Net migration to Australia for 1928 totaled 27,232 persons, of whom 15,705 were males and 11,527 females. The total was 12,684 less than the average for the last five years, according to the Commonwealth Bureau of Census and Statistics. Great Britain was the country of origin of most migrants to Australia and was the destination of nearly half the Australian residents who departed permanently during the year.

The figures given in the accompanying table do not include the full-blooded aborigines, whose number was estimated at 60,000. During 1928 there were 134,078 births, 59,378 deaths, and 48,502 marriages. The populations of the capital cities with their suburbs on Jan. 1, 1929, were as follows: Sydney, New South Wales, 1,127,470; Melbourne, Victoria, 1,000,000; Brisbane, Queensland, 308,580; Adelaide, South Australia, 330,217; Perth, Western Australia, 196,231; Hobart, Tasmania, 55,730.

**EDUCATION.** Throughout Australia, primary education is compulsory and free, while there exists in all states a more or less liberal provision of scholarships and bursaries to the higher state

schools, to the secondary schools, and to the universities. Provided that the requisite standard is reached, it is permissible for children to receive home tuition, or to attend so-called private schools. Early in 1927, there were in the six states of the Commonwealth 11,725 schools of all kinds, with 32,188 teachers. The pupils enrolled numbered 1,147,866 and the average daily attendance was 906,665. There were 10,208 state schools, with 30,992 teachers and an enrollment of 901,326 pupils. The average attendance was 748,712 pupils. For details of education in the respective states and territories, consult the individual articles. At the capital of each state, there is a university.

**PRODUCTION, ETC.** According to the Commonwealth statistician and actuary, the area under the principal agricultural crops and the yield for each during the season 1927-28 was as follows: Wheat, 12,279,088 acres, 118,198,875 bushels; oats, 1,122,303 and 12,084,265, maize, 400,544 and 11,393,860, hay, 2,632,119 acres, 2,858,963 tons, sugar cane, 291,299 and 3,704,439; and cane sugar 516,000 tons. The total area under crops in 1927-28 was 19,219,380. Final estimates for the wheat acreage and yield in 1928-29 were 14,583,509 acres and 160,474,893 bushels, the average yield per acre being 11 bushels.

#### VALUE OF AUSTRALIAN PRODUCTION, YEARS ENDED JUNE 30

Item	1926 Thousand	1927 Thousand	1928 Thousand
Agricultural	£ 89,277	£ 98,295	£ 84,256
Pastoral	119,327	111,718	125,068
Dairy, poultry, bee farming	48,378	46,980	50,261
Forestry and fisheries	12,784	12,790	12,181
Mining	24,592	24,007	22,983
Manufacturing	143,246	153,674	158,582
Totals	471,504	447,424	453,311

In 1926-27, 370,943 acres of barley yielded 6,930,953 bushels, 139,445 acres of potatoes, 373,176 tons, 112,120 acres of vineyards, 13,719 tons of table grapes and 20,456,341 gallons of wine, 276,451 acres of orchards and fruit gardens, yielded produce valued at £8,197,051. The total agricultural yield for the year ending June 30, 1928, was valued at £84,265,000, as compared with £98,295,000 in 1927 and £107,163,000 in 1925.

Livestock in Australia in 1927 included 101,247,476 sheep, 11,616,785 cattle, 2,041,482 horses, and 878,196 swine. Wool production in 1927-28 totaled 888,129,780 pounds and was valued at £75,634,000. The government estimates placed the wool production for 1928-29 at 950,000,00 pounds, with a value of £69,572,000. In 1927-28 the total value of pastoral products was £125,068,000, the highest since 1925, when the figure was £120,773,000.

The value of the manufactured products of Australia increased steadily from £137,977,000 for 1924-25 to £158,592,000 in 1927-28. In the same period, the manufacturing output per head increased from approximately £24 to £26. In 1926-27, 21,570 factories were in operation, with 487,247 employees and a total pay roll of £90,576,166. The value of plants was £220,092,363; the value of materials used, £232,643,518, the value added by manufacture, £162,325,273, and the value of output, £408,692,838. The condition of business depression prevalent in 1927

continued during 1928, although improving somewhat toward the end of the year, in certain lines. Unemployment increased, reaching 11.4 per cent of those seeking work in the middle of 1928, as compared with 6.7 per cent for 1927. Reduced demands, high coal prices, and industrial disputes combined to force out many less efficient manufacturing plants. A financial stringency was relaxed somewhat toward the end of the year, but there was little endeavor to employ available funds in industrial expansion. The production of pig iron and steel declined by 88,127 and 11,969 gross tons, respectively, from the 1927 figures.

The value of mineral production in 1928 was £22,983,000, as compared with £24,007,000 in 1927. The output of the more important minerals in 1927 was as follows: Gold, £2,159,076 (1928, £1,938,971), silver and lead, £3,773,756; copper, £607,038; tin, £842,430; coal, £12,259,769. The development of extensive and high-grade asbestos deposits in Western Australia was begun in August, 1928.

A large building programme for the new capital, Canberra, was commenced during 1929, including the National Memorial, to cost \$1,250,000, and offices and laboratories for the Scientific and Industrial Research Council and various governmental departments. The concentration or rationalization of industry in connection with attempts to reduce production costs made rapid progress during the year. Industrial disputes during 1928 numbered 287 and resulted in the loss of 77,273 working days and £775,359 in wages to 96,422 workmen, according to the Australian Annual Labor Report. In the five years ending in 1928, 58 per cent of all time lost in Australia through industrial disputes was lost by mine workers. The 1928 record for all industries showed a considerable improvement over 1927, but in 1929 conditions became more depressed.

**COMMERCE.** For the year ended June 30, 1929, Australian imports of merchandise, bullion, and specie totaled £143,628,033, as compared with £147,944,970 for the previous year, while exports increased from £143,213,070 in 1927-28 to £144,780,175 in 1928-29. Merchandise imports in 1928-29 were valued at \$143,271,391, as against merchandise exports of £140,853,655, giving an adverse balance of £2,417,736, as compared with £6,464,218 in the preceding year. Decreases in imports of apparel, textiles, automobile tires, and timber were particularly noticeable, while imports of motor-cars and -cycles showed a considerable increase. A comparison of the trade for 1927-28 and 1928-29 and the movement involved, is afforded by the accompanying tables.

#### SUMMARY OF AUSTRALIAN FOREIGN TRADE

Item	1927-28 £	1928-29 £	Movement £
Exports*			
Merchandise	139,472,322	140,853,655	+ 1,381,333
Specie and bul- lion	3,740,748	3,926,520	+ 185,772
Total	143,213,070	144,780,175	+ 1,567,105

## AUSTRALIAN TRADE IN PRINCIPAL COMMODITIES

Item	1927-28	1928-29
<b>Imports</b>		
Apparel and attire	£ 5,506,177	£ 5,903,654
Piece goods—		
Cotton and linen	8,593,908	7,571,121
Silk and linen	5,969,389	6,534,134
Woolen	2,525,179	1,491,128
Petroleum spirits	6,126,562	6,861,885
Lubricating (mineral) oil	3,356,233	1,311,310
Machinery	7,126,915	7,133,028
Other machinery	9,082,180	8,485,712
Motor bodies and parts	1,116,419	1,461,895
Motor chassis and parts	7,140,368	9,204,871
Motor-cycles, side cars, etc	484,509	655,697
Timber—		
Dressed	1,256,227	1,104,793
Undressed	3,812,398	3,084,036
Tires	1,082,640	443,132
Crude rubber	1,959,412	1,361,544
<b>Exports</b>		
Butter	6,905,933	7,543,187
Frozen beef	2,377,987	2,884,287
Frozen lamb	951,120	1,423,440
Frozen mutton	257,886	742,803
Apples	1,636,000	709,671
Dried currants	177,605	597,601
Dried raisins	1,398,595	1,620,477
Other dried fruits	25,632	82,225
Wheat	14,629,899	20,872,624
Flour	5,229,463	6,001,543
Sugar (cane)	4,020,095	5,097,017
Wool—		
Greasy	58,796,318	55,904,868
Scoured	6,812,601	5,543,420
Tops	488,199	166,957
Rabbit skins	2,492,522	2,630,295
Sheepskins	4,453,149	4,588,828
Pig lead	3,516,236	3,239,390
Zinc ore	1,474,546	892,466

The export figures for the year show no variation in trend from those of previous years. Wool, wheat, and flour together furnished 62½ per cent of all exports and other exported pastoral, agricultural, and dairying products raised this percentage to 78½. The proportion of manufactures among the exports was small. The increase in the total value of exports was due almost entirely to the larger wheat crop, exports of which rose from £14,629,899 in 1927-28 to £20,372,624 in 1928-29. Wool exports, on the other hand, were valued at £4,481,873 less than in 1927-28. The accompanying table shows the distribution of Australian overseas trade among the several states.

## AUSTRALIAN OVERSEA TRADE BY STATES, 1928-29

State	Exports	Imports
New South Wales	149,291,112	£63,503,493
Victoria	39,437,225	46,000,880
Queensland	24,125,385	11,594,842
South Australia	14,848,993	11,307,376
Western Australia	15,310,969	9,422,104
Tasmania	2,712,661	1,767,395
Northern Territory	53,730	31,943

Trade between the United States and Australia during the year was marked by decreases in

both imports and exports, the decline in exports to the United States being much the greater. Imports from that country into Australia in 1928-29 were valued at £34,908,440, as compared with £35,520,981 in 1927-28, and the percentage of American imports to total imports for the two years was 24.3 and 24, respectively. Australian exports to the United States dropped from £9,113,253 in 1927-28 to £5,609,046 in 1928-29, a decrease of over 38 per cent.

**FINANCE** As shown in the accompanying table, the Federal government incurred a deficit of £5,450,237 in the fiscal year ending June 30, 1928, the expenditures for the year, exclusive of those from loan funds and special appropriations, having totalled £82,120,459, as compared with revenues of £76,670,222.

## RECEIPTS AND EXPENDITURES OF AUSTRALIAN FEDERAL GOVERNMENT\*

Item	1926-27	1927-28
Receipts	£78,168,235	£76,670,222
Expenditures	75,612,634	82,120,459
Surplus	2,555,597	
Deficit		5,450,237
Accumulated surplus	2,821,494	2,628,743 <sup>b</sup>

\* The 1925-26 figures show a deficit of £2,823,632 and an accumulated surplus of £285,897.

<sup>b</sup> Deficit.

The accumulated surplus of £2,821,494 remaining at the end of 1926-27 was thus converted into a final deficit of £2,628,743. Additional expenditures from loan funds during 1927-28 amounted to £33,210,588, as compared to £19,651,093 in 1926-27 and £22,108,970 in 1925-26. Interest on the World War debt amounting to £29,737,057, also was paid in 1927-28, bringing the total Commonwealth expenditure to £115,331,047. In presenting the budget for 1928-29 to Parliament the Federal treasurer made no provision for the extinction of the debt out of the year's revenue or for its funding, apparently hoping that future surpluses would warrant paying the deficit in suspense. The ordinary budget expenditures for 1928-29 were placed at £83,597,000 and receipts, at £63,610,000. The chief cut in expenditures was for national defense, the appropriation being reduced from £7,917,000 in 1927-28 to £4,666,000 in 1928-29.

On Jan. 1, 1929, the total Commonwealth public debt stood at £513,495,819, or £81 034 per capita. Of this amount, £301,401,427 was held overseas and £212,094,192, in Australia. The annual interest payable on the debt was £27,028,677, the average rate being 5½ per cent. The debt included £133,701,293 raised by the Federal Government for the states. Flotations of loans by the Federal Government for itself and for the states in London, New York, and Australia during the period 1924 to 1928 are shown in the accompanying table.

## COMMONWEALTH PUBLIC DEBT\*—LONDON, NEW YORK, AND AUSTRALIAN FLOTATIONS 1924 TO 1928

Year ended 30th June—	London	Payable in—		Australia	Transferred Properties	Total
		New York	Loans			
	£	£	£	£	£	£
1924	142,524,394		262,215,114	10,860,591		415,600,099
1925	146,117,023		273,972,946	10,858,093		430,948,062
1926	155,883,499	15,411,487	276,086,236	11,065,129		458,443,351
1927	152,858,126	15,365,663	281,819,405	11,035,548		461,067,742
1928	172,497,984	83,563,752	277,081,917	11,085,447		494,128,100

\* Includes Loans raised for States.

The combined Commonwealth and states public debt on June 30, 1928, stood at £1,094,974,058, or a per-capita debt of over £174. The division of the debt between states and Commonwealth and its growth from 1924 to 1928 is shown in the accompanying table.

COMMONWEALTH AND STATES PUBLIC DEBT, 1924 TO 1928

At June 30—	Debt on Account of Commonwealth			Debt on Account of States	Total Debt	Debt per Capita		
	War	Works and other purposes	Total			£	s	d
1924	316,149,348	45,815,122	361,964,470	588,322,885	950,287,355	163	14	10
1925	311,194,196	50,878,571	362,072,767	601,064,157	963,136,924	162	8	9
1926	304,546,357	70,392,357	374,938,714	639,061,929	1,014,000,643	167	15	5
1927	296,905,370	69,706,135	366,611,505	670,869,719	1,043,481,224	169	13	10
1928	293,420,107	79,363,982	372,784,089	722,189,969	1,094,974,058	174	4	9

\* Including debt on account of Federal Capital Commission

In 1929 a royal commission appointed to investigate the finances of South Australia reported that in the nine years from 1920 to 1929, the total public debt of all Australian states had increased by 82 per cent, while that of South Australia had increased by 116 per cent. All the states showed a deficit as a result of financial operations in 1928-29. The deficits were largely due to losses on state-owned railways, which long had presented one of the outstanding difficulties in state finances.

In the same year, all the states except New South Wales showed a reduction of loan expenditure, the total loan expenditure for the six states being £188,895,000, or a reduction of \$8,605,000, as compared with 1927-28.

For state finances, see articles on the individual states.

**COMMUNICATIONS.** The total number of vessels registered in Australia in 1927 was 2220 of 391,975 tons. In the overseas trade in 1928, 3167 vessels of 10,925,298 tons entered and cleared Australian ports. The total mileage of government railways open to traffic in 1928 was 25,804. The gross revenue for the year was £48,186,022 and the working expenses, £38,358,104. Three hundred miles of government railway, linking Oodnadatta, formerly the northern terminus of a line running south to Adelaide, with Alice Springs, Central Australia, were completed in August, 1929. Together with some 3144 miles of private line, this brought the railway mileage in operation in the country in 1929 to about 29,288 miles. Up to Jan. 1, 1929, approximately 4500 miles of highway had been constructed, formed, or inclosed in the different states with the assistance of the Federal government under the Federal-aid road agreement entered into between the Commonwealth and state governments two years before. Expenditures in connection with this work were placed at £3,500,000 (£16,979,375), distributed as follows. New South Wales, £1,932,615, Queensland, £1,316,000, South Australia, £798,000, Western Australia, £1,344,000, and Tasmania, £350,000. On Jan. 1, 1929, 53 individuals or companies were operating 106 registered airplanes in Australia, many of them in connection with mail or passenger service.

**GOVERNMENT.** The executive power is vested in the King, who acts through a Governor-General, assisted by an executive council of responsible ministers, who must be members of the Federal Parliament, comprising the Senate and House of Representatives. The Senate consists of at least

six members from each of the original states, elected for six years, half of whom are renewed every three years, while the House of Representatives consists of approximately twice as many members as there are senators, the representation being apportioned among the several states

according to the population shown at the last census. The number in the House in 1929 was 75 and in the Senate, 36. After the general election of Oct. 12, 1929, which resulted in the defeat of Premier Stanley M. Bruce and the formation of a Labor Ministry, the composition of the House was as follows: Laborites, 40, Nationalists, 14, Country party representatives, 10, Independents, 4, Country Party Progressives, 1. The Governor-General in 1929 was Baron Stonehaven (appointed October, 1925). The new Labor Ministry was headed by J. H. Scullin as Prime Minister, with E. G. Theodore as treasurer.

**HISTORY.** The failure of Australia to recover from its financial and economic depression gave rise to serious concern during 1929 and had its repercussions in the general election of October 12, at which the Nationalist-Country party coalition government headed by Premier Stanley M. Bruce was overturned by an unprecedented Labor victory. The issue upon which the election was fought was the Prime Minister's attempt to secure the abolition of Federal compulsory arbitration of industrial disputes except in the maritime industries. Compulsory arbitration had been an important issue in Australian politics since the first Federal Arbitration Act was passed in 1904. The position of Mr. Bruce and his party was that compulsory arbitration had been a failure, except in such nation-wide industries as shipping, due to the divided authority exercised in such matters by the Federal and state governments. Mr. Bruce favored placing upon the individual states the constitutional responsibility for the enforcement of compulsory arbitration. He pointed to the financial and economic condition of the country as evidence that something was wrong with the governmental system. Former Prime Minister William M. Hughes, although the founder of the Nationalist party in 1917, joined with Labor in demanding the extension of the Federal government's powers in compulsory arbitration matters, rather than the delegation of existing powers to the states. Labor also attacked the amusement-tax proposals of the government, its protective tariff policy, which, it was charged, placed a heavy burden upon the consumer and the country producer, and the granting by the government to the Anglo-Persian Oil Company of special advantages in Australia, Papua, and the mandated territory of New Guinea. The government had proposed to meet the Treasury deficit by raising £600,000 from an amusement tax and £2,750,000 from

new revenue duties. The Bruce government was defeated in Parliament on September 10, when an amendment introduced by Mr. Hughes to defer consideration of the government's arbitration bill until a national referendum should have been held was carried by a vote of 35 to 34.

In the election, Labor polled approximately 1,339,000 votes, the Nationalists, 935,000; the Country party, 275,000, and the Independents, 177,000. Mr. Bruce himself lost his seat in Parliament.

The Labor government assumed office faced with a £5,000,000 deficit, and a serious unemployment crisis. The new Prime Minister, Mr. J. H. Scullin, announced that the election was a mandate to amend the Arbitration Act and remove from it the legal technicalities and penal clauses. Impartial tribunals for the regulation of industry would be set up, he said, but he gave notice that the wage standard must not be reduced and that any reduction in the cost of production must not be attempted through a reduction in wages. One of the first acts of the Labor government was the abolition of the compulsory military system inaugurated during the Japanese war scare of 1911. It was decided to maintain an army organization of two cavalry and four infantry brigades and four mixed brigades as a nucleus of a voluntary citizen force.

The government also agreed to the resumption of diplomatic relations between Great Britain and Soviet Russia, providing that the mutual pledge with regard to Communist propaganda applied to Australia, as well as to the mother country. The British Government was asked also to suspend assisted immigration to Australia until the employment situation there improved. The Federal Parliament, which adjourned Mar. 22, 1929, passed laws confirming the drastic regulations imposed by the Bruce government during the shipping strike in September, 1928, ratified a financial agreement with the states, through which the Federal government contributes toward interest and sinking fund on the states' debts, and reconstituted the Tariff Board to insure a division of its labors. An Economic Research Bureau to deal with tariffs, marketing, taxation, finance, and transport was established, as was also a wine export authority.

In May, the government, in a memorandum sent to the State Department of the United States, formally protested against any increase in the American tariff schedule on goods exported from Australia. The memorandum pointed out that American exports to Australia are increasing steadily while Australian exports to the United States are declining, the balance of trade in 1927-28 being \$111,010,980 in favor of the United States.

To meet the accumulated Treasury deficit, the Bruce government increased by 10 per cent the duties on real silk, artificial silk, precious stones, and motor chassis. Duties also were increased on foreign films, liquors, tobacco, cigarettes, and cigars. A drastic curtailment of public works also was agreed upon by the Federal and state governments, the sum appropriated for this purpose during the year being reduced from \$175,000,000 to \$140,000,000. The Labor treasurer, Mr. Theodore, announced after examining his predecessor's budget, that he foresaw a deficit of £1,000,000 instead of the £380,000 surplus estimated. To meet the threatened deficit, the new government raised the duties on a large number

of articles of import. The new tariff measure aroused criticism in Great Britain, where it was said that the preferences given Great Britain were so ineffective as to be valueless.

One of the results of the general election was the formation in November of a new political party by former Premier W. M. Hughes and his associates, who led the revolt within the Nationalist party against former Premier Bruce on the question of the abolition of Federal arbitration.

**AUSTRIA.** A republic of central Europe, proclaimed Nov. 12, 1918, after the revolution following the World War, boundaries defined by the Treaty of St. Germain, signed Sept. 10, 1919. It consists of the following nine provinces, the City of Vienna, Lower Austria, Upper Austria, Salzburg, Styria, Carinthia, Tirol, Vorarlberg, and Burgenland. Capital, Vienna.

**AREA AND POPULATION.** According to the census of Mar. 7, 1923, the total area was 32,369 square miles and the population, 6,534,481, giving a density of 202 persons to the square mile. The estimated population June 30, 1928, was 6,675,283. The area of the Austrian provinces before the World War was 39,012 square miles and the population, according to the census of 1910, 7,529,935. According to the 1923 census, the City of Vienna, which constitutes a province, had a population of 1,865,780, making up 28.55 per cent of the total number of inhabitants. The census of July 31, 1928, showed 1,857,400 inhabitants, of whom 999,022 were women. The other chief cities with their populations on Mar. 7, 1923, were Graz, 152,706, Lanz, 102,081, Innsbruck, 56,401, Salzburg, 37,856, Wiener Neustadt, 36,956, St. Pölten, 31,619, Klagenfurt, 27,423, Steyr, 22,111, Mödling, 18,677, Villach, 22,070, Wels, 16,412, and Baden, 22,217. The movement of population in 1927 was births, 118,741; deaths, 99,330, marriages, 48,523, divorces, (excluding Burgenland), 5350.

Of the total population in 1929, about 3,400,000 were wage earners or made an independent living, 1,400,000 of them in agriculture, 1,000,000 in industry and trade, 600,000 in commerce, and 200,000 in the public service. From the end of the World War to Jan. 1, 1929, 57,361 Austrians immigrated to foreign lands, 28,890 going to the United States, 12,897 to Brazil, 7741 to Argentina, 3548 to Canada, 283 to Paraguay, and 205 to Uruguay. Of 5339 emigrants in 1927, 1020 went to the United States, 1396 to Canada, 945 to Brazil, and 1100 to Argentina.

**EDUCATION.** Primary education is compulsory between the ages of 6 and 14, but exemptions are easily obtained for children of the age of 12 and over. The cost of elementary instruction is borne chiefly by the communes and provinces. In 1926 there were in the Republic 5293 public and private elementary schools, with 28,757 teachers and 712,225 pupils, a decrease of more than 5000 pupils from the 1925 attendance. Secondary education is provided by *gymnasien*, *realschulen*, middle schools, and middle schools for girls. In 1926 there were 147 secondary schools of all types with 3672 teachers and 40,122 pupils. There are three universities maintained by the state, namely, Vienna, which had 11,032 students in 1928-29, Graz, 1853 students in 1927-28; and Innsbruck, 2293 students in 1927-28. In 1928-27 670,427 students were enrolled in university extension courses, and 49,841 students in 152 colleges (*gymnasien*, *realschulen* and *real-*

*schulen*). The technical schools of Vienna and Gratz, and the School of Agriculture, Veterinary School, and the Mining Academy (Loeben), all have university rank.

PRODUCTION. Although compelled to make a new start as a result of changes caused by the World War, agriculture remained the principal occupation of the people and the country's leading economic asset. The accompanying table shows the area under cultivation and the yields of fifteen leading crops in 1928, as compared with similar figures for 1919.

increased from year to year, amounting to 21,000 acres in 1927 and 23,000 acres in 1928. The value of livestock in the country in 1929 was estimated at more than 2,000,000,000 schillings. The latest census (1923) showed 283,000 horses, 1,860,243 cattle, and 302,103 oxen. Cattle and swine were imported in large numbers for slaughter. Timber exported during 1928 totaled 2,200,000 tons, going principally to Germany.

Less than 0.5 per cent of the great coal deposits of the Hapsburg Empire were retained by the Austrian Republic. The output of Austrian

## AGRICULTURAL PRODUCTION OF AUSTRIA

Crops	Area under cultivation (in acres)		Harvest yields (in hundredweights)		1928 against 1919 (increase in %)
	1919	1928	1919	1928	
Wheat ..	454,000	504,000	3,352,000	6,459,000	92.7
Rye	810,000	946,000	5,150,000	9,573,000	85.9
Barley ..	286,000	365,000	2,242,000	5,028,000	124.2
Oats	659,000	765,000	4,270,000	8,472,000	98.4
Maize	141,000	146,000	1,463,000	1,931,000	32.0
Beans	9,000	26,000	55,000	201,000	264.3
Peas	4,000	9,000	24,000	89,000	174.7
Flax	5,000	9,000	43,000	87,000	100.0
Linseed	6,000	7,000	30,000	22,000	10.0
Potatoes	284,000	454,000	13,693,000	40,108,000	192.9
Beet roots	20,000	69,000	2,661,000	13,888,000	421.8
Turnips	111,000	131,000	12,526,000	26,516,000	111.7
Clover	469,000	560,000	11,949,000	24,902,000	108.4
Vetch	40,000	101,000	768,000	3,543,000	361.5
Hay	2,489,000	2,332,000	53,630,000	67,972,000	26.7

In 1927 the total area sown amounted to 4,762,740 acres, of which 2,114,281 were in Lower Austria and 1,023,390 in Upper Austria. For almost a decade after the War, the foodstuffs produced in Austria did not suffice for the needs of the population. In 1927-28, however, the national consumption of cereals, with the exception of wheat and maize, was almost entirely covered by the domestic production, more than half of the sugar requirements were produced in the country, and a surplus of some 4000 carloads of potatoes was exported. The expansion of the sugar-beet industry promises to meet the domestic requirements by 1932. It has given a powerful stimulus to the raising of cattle fed on beet fodder. The 1928 sugar production was estimated at 121,240 short tons. Wine production was 804,000 hectolitres, as compared with 226,000 hectolitres in 1927. The total value of agricultural products in 1928 exceeded 2,000,000,000 schillings, as against 600,000,000 schillings in 1919 (1 schilling is a par value of \$0.1407). The decrease in agricultural land by drainage in

mines in 1928 was about 3,200,000 tons, most of it lignite. This was 5,600,000 tons short of domestic requirements. Production of other important minerals and metal products in 1928 included pig iron, 457,911 metric tons; steel, 635,057 tons; finished, rolled, and wrought-iron goods, 480,898 tons; sinter magnesite, 84,000 tons; magnesite bricks, 40,000 tons; salt, 81,375 tons. Copper, zinc, and lead are also produced. In general, the iron and steel industry showed distinct improvement over 1927. The principal industries are the manufacture of pianos, automobiles (output of seven factories about 10,000 cars annually), machines, furniture, textiles, shoes, and leather goods. The mine factories of the Austrian tobacco monopoly in 1927 made 203,239,000 cigars, 4,005,522,000 cigarettes, and 51,796 metric quintals of smoking tobacco. In 1929 the industrial situation improved somewhat, although hampered by unsettled political conditions. All of the principal industries were fairly well occupied, except the textile plants, a number of which were forced to close for lack

## AUSTRIAN FOREIGN TRADE, 1926-28

	1926	1927	1928	1926	1927 Value in million schillings	1928

of orders. Chronic unemployment remained a sharp burden upon industry. In 1928 the number of unemployed averaged 156,000 monthly.

COMMERCE. Austria's adverse balance of trade has regularly amounted to over 1,000,000 schillings annually for a number of years. In 1928 imports were valued at 3,250,800,000 schillings and exports at 2,219,300,000 schillings, as compared with imports of 3,184,298,000 schillings and exports of 2,098,093,000 schillings in 1927. In the table on page 79, the chief imports and exports are compared as to quantity and value for the period from 1926 to 1928.

The measures taken by Austria's neighboring states to protect their markets against her exports and the strong sentiment for political union with Germany were reflected in the foreign-trade figures for the years 1926 and 1928. Austrian exports to Germany rose from 202,100,000 schillings in 1926 to 407,000,000 in 1928, an increase of over 100 per cent, while imports from Germany in the same years totaled 472,000,000 schillings and 645,100,000 schillings, respectively. The increase in the total of Austrian exports for the period was 38 6 per cent. After Germany, Czechoslovakia, Italy, Hungary, Yugoslavia, Switzerland, and Rumania rank in order as purchasers of Austrian products and Czechoslovakia, Poland, Hungary, the United States, and Switzerland are the principal sources of Austrian imports. The adverse trade balance for 1929 was estimated at 1,100,000,000 schillings.

A treaty of friendship, commerce, and consular rights, concluded between the United States and Austria in 1928, was ratified by the U. S. Senate Feb. 11, 1929. The commercial activities of the nation are largely concentrated in Vienna, which still serves as the principal distributing point for Eastern and Southeastern Europe. The earnings on its important transit trains, the tourist trade, and the income from industries of the former Austro-Hungarian Empire still owned in Vienna serves to offset in a large measure the annual adverse trade balance of the nation.

FINANCE. The budget for 1929 provided for current expenditures of 1,767,400,000 schillings and revenues of 1,801,900,000 schillings. The preliminary figures for 1928 showed current expenditures of 1,725,800,000 schillings and revenues of 1,852,000,000 schillings, an improvement over the slight deficits incurred in 1926 and 1927 brought under the schedule on which the League of Nations established its reform plan, the 1929 budget included as current transactions the sums of 1,022,700,000 schillings for expenditure and 1,057,000,000 schillings for revenue and in addition 245,000,000 schillings for capital expenditures, leaving a total deficit of 183,900,000 schillings. On this basis, the deficit for 1928 was 245,000,000 schillings (preliminary figure), and for 1927, 85,000,000 schillings. These deficits represent the proportion of capital expenditure which could not be met out of current revenue and was defrayed out of the International Loan funds and the existing Treasury reserves. The capital investments were employed principally to electrify the mountainous sections of the government railway system, to advance agriculture, and for the installment of long-distance underground telephone cables. In 1928 the gross amount required for interest and redemption charges on the International Loan was 101,100,000 schillings. The proceeds from the customs duties and tobacco monopoly, which

serve as collateral, exceeded the requirement six times. Excluding relief loans secured from foreign governments in 1919 and 1920, the total foreign indebtedness of the Republic on Jan. 1, 1929, was 1,097,100,000 schillings and the internal debt was 400,700,000 schillings. The redemption of the relief loans under favorable conditions within a period of forty years was arranged by the Austrian Government in 1928 with the majority of the creditor states.

The proposed budget for 1930 estimated ordinary revenues at 1,975,000,000, and ordinary expenditures at 1,940,000,000, schillings. Including investments on capital account, to be covered in part by a \$100,000,000 foreign loan, the proposed budget would show a final deficit of 154,000,000 schillings.

COMMUNICATIONS. The Austrian Federal Railways, according to the official report for 1927, had a fairly successful year despite the economic difficulties which continued to beset the country. The length of the Austrian railways at the close of 1927 totaled 4150 miles, of which 3018 miles were operated by the state and 532 miles by private companies. At the end of 1927, 370 miles of state railways had been electrified. Operating revenues during the year amounted to \$85,300,000 (\$82,100,000 in 1926) and operating expenses to \$78,600,000 (\$77,700,000 in 1926).

In recent years, the Austrian Postal Administration has organized and operated a network of autobus lines in the Alpine districts of the country. In 1929 about 500 buses were operated over 200 lines with a total length of over 4000 miles. Regular air lines, many of them subsidized by the state, were in operation between Vienna, Berlin, Zurich, Paris, Venice, Rome, Munich, Ciacow, Warsaw, Budapest, and Constantinople. In 1928, 7858 flights were made, carrying 18,287 passengers without an accident. The number of foreigners visiting Vienna in 1928 was about 537,000.

GOVERNMENT. According to the provisions of the constitution which went into operation on Nov. 10, 1920, Austria was declared to be a federal republic, composed of eight provinces and the City of Vienna. The President is chosen for four years by both Houses of the Legislature. He may not be reelected more than once. The Legislature is bicameral, consisting of the Assembly (Nationalrat) and the Bundesrat (Bundesrat). The powers of the latter are advisory. At the elections held on Apr. 24, 1927, the following parties were returned: Christian Socialists, 73, Social Democrats, 71, German Nationalists, 12, Peasants' party, 9. President in 1929, Dr. Wilhelm Miklas (Christian Socialist), elected Dec. 5, 1928, for a four-year term. The Ministry as formed on Sept. 26, 1929, was composed as follows: Chancellor and Minister of Foreign Affairs, Johann Schober, Vice Chancellor and Minister of Defense, Karl Vaugon, Minister of Interior, Vincenz Schmayr, Minister of Commerce and Communications, Michael Hainisch, Minister of Agriculture, Florian Foedermayr, Minister of Social Welfare, Professor Theodor Innitzer, Minister of Justice, Franz Slama.

HISTORY. The bitter political struggle between Socialist Vienna and the Catholic and conservative provinces continued during 1929, marked by recurrent riots, armed clashes, and the growing power of the Heimwehr, the unofficial provincial militia. A firm stand by Johann Schober,

former Chancellor and Police President of Vienna, who again became Chancellor on September 26, apparently was all that prevented a Heimwehr march on Vienna. Despite political difficulties, the industrial, economic, and agricultural progress of the country continued.

The new Chancellor was the second person called to that office during 1929. Ignaz Seipel, the Roman Catholic priest who had served as Chancellor since 1927, resigned on April 3 due to strife within his Christian Socialist party and criticism of his dual rôle as priest and state official. It was a month later (May 4) before the involved political situation allowed the formation of a new cabinet headed by Ernst Streinewitz. The other members were Vice Chancellor, Vincenz Schuny, Public Instruction, Dr Emeric Cernak, War, Karl Vaugoin, Finances, Dr Johan Mittelberger, Social Welfare, Dr Joseph Resch, Agriculture, Florian Doedeimayr, Commerce, Hans Sonnleit, Justice, Dr Franz Slama. Outside the ranks of the Pan-Germans, who were delighted with the fact that the cabinet contained six members pledged to promote union with Germany while the remaining members were favorable to union, the new ministry provoked little enthusiasm. The Chancellor and five other members of the cabinet were Christian Socialists, while two were representatives of the Pan-German party, and one, of the Peasants' party.

The interim between cabinets had been marked by repeated threats of a Heimwehr march on Vienna and an ensuing dictatorship and fulminations by Heimwehr leaders generally against all parliaments. The Heimwehr had been a loose but well-recognized institution for centuries in the mountainous sections of Austria and, at the close of the World War, it was organized for the defense of the frontier, particularly in Carinthia before the plebiscite. It was not made use of as a weapon against the Socialists until after the Socialist outbreak in Vienna in July, 1927. The Heimwehr received encouragement from Chancellor Seipel, and other members of his (Christian-Socialist) party objected to its threat against parliamentary government. In February, 1929, the Christian Social workers of Vienna organized another unofficial military force to oppose the dictatorial tendencies of the Socialist municipal guard, but announced that it would side with the Socialists in any attempt of the Heimwehr to establish a dictatorship.

The Seipel government, by massing the combined forces of the army, gendarmerie, and police at strategic points in Vienna on February 24 averted a threatened clash between the Heimwehr and Socialist militia, which staged rival demonstrations within the city. These demonstrations were frequent during the year. Chancellors Streinewitz and Schober both made it plain that the police and the army would be used to quell any open threat against constitutional government. Minor clashes between the opposing factions continued at frequent intervals, however, and for the first time in many years Jewish students at the University of Vienna, were assaulted and driven from university buildings by students affiliated with the Heimwehr (see Jews). On August 18, a clash between the Heimwehr and Socialists resulted in one death and injuries to 62.

Premier Briand of France informed the League

of Nations on June 17 that the armed state of Austria constituted a menace to her neighbors. At the same time, the board delegated to remove Allied military control from Austria, reported that Austria was secretly arming in defiance of the terms of the peace treaty. Austrians denied that the militia activities constituted a threat against neighboring countries. Transformation of the army from the main support of Austrian Socialism to the nonpolitical instrument of the Conservative government went on rapidly during the year under the direction of Karl Vaugoin, Minister of War in the three successive cabinets. The Socialist *Arbeiter Zeitung* in July published a document said to have been stolen from Heimwehr headquarters at Graz, the contents of which indicated a secret liaison between the Seipel ministry and the Heimwehr organization.

The possibility that a Heimwehr coup would bring foreign intervention apparently was a strong factor in the decision of Heimwehr leaders to cripple the power of the Socialists by revision of the constitution. The Streinewitz cabinet was forced to resign September 25 due to its unwillingness to approve the desired constitutional changes and on September 26 a new cabinet was formed by Schober. He selected a moderate but strong cabinet calculated to inspire confidence that any revision of the constitution would be done in accordance with democratic practices (See under *Government* above). Chancellor Schober forbade further demonstrations and mass parades on the part of either Heimwehr or socialist militia. The situation again assumed a critical aspect, however, when the cabinet's proposals for constitutional changes strengthening the hands of the President and Federal Government and restricting the power of Vienna and its Socialist administration were submitted to Parliament. Early in November the British Foreign Minister, Arthur Henderson, warned the Government that the British Government was gravely concerned lest a breakdown of parliamentary negotiations for constitutional reform and the adoption of nonparliamentary action should threaten the stability of Europe.

The Constitutional changes proposed by Chancellor Schober were finally passed by Parliament in revised form on December 7. Vienna, in spite of Heimwehr objections, remained a federal state, but part of its revenues were henceforth to go to lower Austria. Provision was made for the dissolution of the Vienna municipal guard, or *Schutzbund*, which was to be absorbed by the state police. The powers of the Austrian President in time of crisis were strengthened but his general powers were restricted in a way rendering the establishment of a dictatorship unlikely. The president henceforth was to be elected by the people instead of by Parliament, education was unified under the Federal Ministry of Education, and the law courts were deprived of their political character. The Constitution represented a compromise between Socialists and Conservatives, thus nullifying the Heimwehr plans for the establishment of a Fascist state. Following its adoption, the Heimwehr issued a proclamation calling upon its members to carry on a still more bitter fight in the future. Chancellor Schober then turned his efforts toward tiding the country of the Heimwehr menace.

UNION WITH GERMANY. The movement for union between Austria and Germany, or "Ansch-

loan," as it is called, advanced during 1929 to a point where partial if not complete union was considered imminent. The Austrian Schubert Bund was welcomed in the chamber of the Reichstag with the assurance from Paul Loebe, president of the chamber, that union would be achieved. Other more significant indications of the development of *Anschluss* were seen in a meeting of Austrian and German lawyers and judges in Munich, where differences in the penal codes of the two countries were largely eliminated. Unification of the railway and postal services also was begun, the plan being to raise the Austrian and postal tariffs gradually to the German level. It was realized that precipitate action would raise the cost of living for Austrians. While no important political group in Austria has opposed *Anschluss*, the majority of the members of Parliament and nearly every school-teacher and public official signed a manifesto favoring union with Germany. Former Chancellor Seipel, in discussing *Anschluss* before Catholic students on July 8, proved lukewarm if not unfriendly to the movement.

**OTHER EVENTS.** The announcement on December 13 that Italy had withdrawn its objections to a new Austrian loan marked the restoration of friendly relations between the two powers. They had been at odds since Chancellor Seipel protested in 1928 against Italy's treatment of the South Tyroleans (see ITALY, under *History*). When the League of Nations loan was obtained, Austria bound herself to obtain the assent of the powers to any further issue. All of the other powers had approved Austria's application for a new loan, which was sorely needed to aid in the further economic reconstruction of the country.

Important Austrian archives covering the period from the Bosnian crisis of 1908 to 1914 and shedding new light on the origins of the World War were published by the Austrian Government in eight volumes on December 1. The collection of over 11,000 documents was said to contain evidence that Austria was primarily responsible for the outbreak of the War.

The acquittal of a number of self-confessed murderers in Vienna during the year aroused much public dissatisfaction and lynch law was widely suggested as the alternative to the work of soft-hearted Viennese judges. The situation was attributed to political animosities, underpaid judges, a complicated penal code, overdeveloped sentimentality, inherited distrust of the state, and an overdose of Freudianism.

**AUTHORS' LEAGUE OF AMERICA.** A national organization of authors, artists, dramatists, and screen writers founded and incorporated in 1912 for the purpose of procuring adequate copyright legislation, both international and domestic, for protecting the rights and property of all those who create copyrightable material; for advising all such in the disposal of their productions and for obtaining for them prompt remuneration therefor, and for disseminating information among them as to their just rights and remedies. The league supplies to its members confidential information relating to publishers, theatrical and motion-picture producers, art buyers, and other persons and companies engaged in the purchase, sale, publication, or production of copyrightable material.

The league is divided into four departments or guilds: The Dramatists' Guild; the Authors'

Guild; the Artists' Guild; and the Screen Writers' Guild. Closely affiliated with the league are the Authors' League Fund and the Literary Council of the Authors' League. The fund is an agency formed by the league to meet its obligations with respect to the care of the sick, the aged, and the unfortunate, the endowment in 1929 amounting to about \$70,000. The Literary Council is a semi-independent group whose purpose is to advise and assist the league in purely artistic or literary matters; its membership in 1929 numbered 60 and included non-members as well as members. The officers of the league in 1929 were President, Arthur Richman; vice president, Inez Haynes Irwin, secretary and treasurer, Louise Silcock. Headquarters are at 2 East Twenty-third Street, New York City.

**AUTOGYRO.** See AERONAUTICS.  
**AUTOMOBILE LIABILITY.** See INSURANCE.

**AUTOMOBILE RACING.** The most notable performance of the year 1929 in auto racing was the winning of the 500-mile international motor race at Indianapolis before 100,000 persons by Ray Keech who sprang from the obscurity of the dirt tracks of Philadelphia to prominence. Two weeks later, on June 15, at the age of twenty-eight, he was killed on the Altona Speedway. Jimmy Gleason, Carl Marchese, and "Speed" Gardner followed Keech to the finish line in the Indianapolis race in which he averaged 97.58 miles an hour.

Sir Henry Segrave of England succeeded in bettering Keech's world mark for a mile down the straightaway course at Daytona Beach, on March 11, when he was clocked at an average speed of 231.36246 miles an hour. A month later, Captain Malcolm Campbell, former holder of the record, reached only 218.54 on the dried bed of a lake in Verneucq Pan, South Africa. He did set a five-mile record of 212 miles an hour on the same course.

**AUTOMOBILES.** With an increase of more than a million units over the previous year, 1929 set a new record for American production of motor cars and trucks. The total of both built in the United States and Canada during the year was 5,651,000, an increase of 22.8 per cent over that of 1928 which was the previous best year's record. It was the first full year in which Ford had been back in capacity production and Ford alone showed an increase over the previous year of 138 per cent or 1,132,358 units. The rest of the industry showed an actual decrease of 3.6 per cent although Ford's nearest competitor, the Chevrolet, bettered its 1928 record by 8.4 per cent and several other individual manufacturers also made gains.

While so many more new cars were made and sold, it was largely at the expense of the used-car market, for many of those who normally would purchase such cars, instead bought the lower-priced new cars, leaving dealers with an unwelcome accumulation of used-car stocks. Taking cars as a whole—that is used and new—there was undoubtedly "overproduction," even though the new cars were practically all disposed of, and the factories, appreciating this, at the end of the year in general were planning reduced schedules for 1930. It was probably a safe prediction that not over 5,000,000 would be turned out in 1930.

Up to and including 1917, production steadily increased, the first recession coming in 1918. Whether coincidence or not, it is interesting to

observe that since that time production has slumped every third year—in 1921, 1924, and 1927—according to which a falling off was due for 1930.

Truck production in 1929 made the remarkable gain of 40 per cent over 1928, increasing from 578,551 to 805,000. Vehicles of one ton and under represented 75 per cent of the total production. Much of the increased production was exported, for there was a 65 per cent gain in American foreign business in commercial vehicles, reaching 345,000 units, as against 209,560 in 1928.

Several new cars made their début in 1929. The Roosevelt, a low-priced straight eight, was introduced by Marmon in March. The Viking, a V-eight, was brought out by the Olds Motor Works in April. The Marquette, a six, was added to the Buick line in June. Two radically new designs with front-wheel drive appeared about the same time—the Ruxton presented by a new company, New Era Motors, Inc., afterward taken over by the Moon Motor Car Company, and the Cord, built by the Auburn Automobile Company. A third front-drive car, but of considerably lower price, was announced by Gaidner. In June, the Hudson added a commercial car to its line—the Dover.

A few of the old-line cars brought out new models during the year, beginning with the Buick toward the end of July, but it was becoming more and more the practice to withhold the disclosing of new models until the National Automobile Show in New York early in January.

Principal among the innovations developed during the year and to be displayed at that event, in addition to the front-wheel drive cars, was the sixteen-cylinder Cadillac, built as an addition to the V-eight Cadillac and LaSalle models, to cater to the market that desires the maximum in convenience, performance, and luxury. Also the hering-bone transmission of the Geo giving silent intermediate speeds, the clashless gear-shift of the Pierce-Arrow, also using constant-mesh hering-bone gears in its transmission, radio receiving sets as optional equipment on Chrysler and De Soto, and the newcomers in the eight-cylinder field—Hudson, Nash, Dodge, DeSoto, and Oakland—all of straight-eight type except the Oakland, which adheres to the General Motors' policy of building V-eights only.

With these new additions to that field, for the first time the eight-cylinder models offered outnumbered the sixes, which for sixteen years had predominated in popularity. At the end of 1929, for the following year, there were three makes of four-cylinder cars, twenty-three of six, twenty-eight of eight, and one of sixteen cylinders. Only one manufacturer produced fours exclusively, two made both fours and sixes, five made sixes exclusively, fourteen made sixes and eights, nine made eights exclusively, and one made eights and sixteens. Of the total of 268 cars to be displayed at the New York show, 147 were eight-cylinder models. Registration figures from 43 States for the first ten months of 1929 showed that in cars costing more than \$1000 there was a 62 per cent increase in eights and an 18 per cent decrease in sixes.

Practically all of the new cars incorporated changes and improvements that, while not generally new to the industry, were to their lines. For example, several that had not had them previously adopted four-speed transmissions, cen-

tralized chassis lubrication systems, rubber or fabric spring mountings doing away with need of lubricated shackles, shatterless glass in windshields, and closed bodies, stainless steel for bright metal parts, dual ignition, rubber engine mountings, downdraft carburetors, etc. In general, there was a decided trend toward greater engine power, wider seats, roomier interiors and longer, lower lines.

STATISTICS The National Automobile Chamber of Commerce in its preliminary statement of facts and figures of the automobile industry for 1929, showed that of the total production already mentioned, 4,846,000 were passenger cars and 805,000, trucks, and 87 per cent, or 4,218,000 of the passenger cars, were closed models. By contrast, ten years previously, 83 per cent of the passenger cars produced were open models. The wholesale value of the entire production in 1929 was \$3,483,900,000, made up of \$2,952,900,000 for passenger cars and \$531,000,000 for trucks. The average retail price for passenger cars was \$812 and for trucks \$877. The wholesale value of parts and accessories for replacements, and of service equipment was \$920,000,000. The total tire production in the United States was 75,000,000 and the wholesale value of rubber tires for replacement \$600,000,000.

With an 8 per cent gain in registration over 1928, motor vehicles registered in the United States during 1929 (from State reports) totaled 26,400,000; passenger cars being 23,030,000 and motor trucks 3,370,000. The world registration of motor vehicles was estimated at 34,700,000, so that 76 per cent was in the United States. Farmers use 5,800,000 of the motor vehicles registered in the United States. The total miles of highways in the United States are 3,016,281, of which 600,000 miles are surfaced highway. During 1929, \$2,000,000,000 was expended on highways and streets in the United States. The State and Federal governments in 1929 collected a total of \$925,000,000 taxes on motor vehicles. Gasoline taxes alone were \$415,000,000. See ROADS AND PAVEMENTS.

As showing to what extent the automobile industry affects other lines of business, the following are interesting figures. Railroads in the United States in 1929 handled a total of 3,600,000 carloads of automotive freight. Of all the rubber used in the country during the year, 85 per cent was taken by the automobile industry, 67 per cent of all plate glass, 19 per cent of iron and steel, 15 per cent of copper, 18 per cent of lumber and hardwood, and 27 per cent of the lead production were used by the automobile industry. Of all the gasoline produced, 80 per cent was consumed by the motor industry. The quantity used in 1929, measured in barrels of 42 gallons each, was 297,000,000. Crude rubber used for tires and otherwise in the motor industry was 913,920,000 pounds for 1929. Likewise used in tires was 287,000,000 pounds of cotton fabric.

The extent to which motor trucks and motor buses figure in the handling of merchandise and passengers shows the important place that they have now taken with other transportation systems. It has already been mentioned that there were 3,370,000 motor trucks in use. The number of owners of motor trucks was 2,460,000, and the motor buses in use numbered 95,000. Not least among the benefits of motor transportation was the better education that was being afforded the youth in rural territory, for there were now

16,500 consolidated schools using motor transportation. 43,000 busses were so used.

Three hundred street railways were using 11,500 busses and 70 steam railroads used 1900 busses, 75 of the railroads were using 7000 motor trucks as a part of their shipping service.

The retail motor-vehicle business in the United States represented in the sale of the vehicles themselves, from service, storage, and supplies was continually increasing. At the end of 1929, there were 56,300 car and truck dealers, 51,200 public garages, 95,800 service stations and repair shops, 76,600 supply stores, and 320,000 gasoline filling stations using a total of 610,000 gasoline pumps.

No part of the industry's expansion was so striking as its increasing foreign market. In 1929 the number of American motor vehicles sold outside of the United States, that is including exports from the United States and the output of Canadian plants owned in the United States, was 1,015,000. The value of these vehicles and the parts and tires sold outside of the United States in 1929 was \$757,400,000. This was a 23 per cent increase in foreign sales over 1928. Of the total automotive output, 18 per cent was sold outside the United States. Insignificant by comparison was the number of motor vehicles imported in 1929—710.

**LEGISLATION** The year 1929 saw considerable activity in legislation relating to the use and regulation of motor vehicles, for 43 State legislatures were in session. Not all enactments were pleasing to motorists because some increased taxes. The increasing use of motor cars has made them an ever-increasing attraction as a source of tax revenue. The two States not having gasoline taxes adopted them, so that all States now have such taxes, ranging from two to six cents per gallon. Thirty-nine States had a tax of three cents or more. In general, the industry's attitude toward the gasoline tax has been one of approval so long as the income so collected by the State was applied to the roads, and only a nominal registration fee is exacted in addition. Most States made no reduction in the registration fee when adding the gasoline tax and so did not limit the expenditure of the revenue from motor-vehicle taxation to highway maintenance. Even when the income from the gasoline tax is partly expended on improvement of roads, motorists have been patient, though their contention is that new construction should be financed by bond issues and only repair and upkeep should be supported by taxing the users of the highways, because all citizens benefit from road improvements. Objection was made, however, to the diverting of any part of this revenue to any other purpose as was allowed by the laws of Florida, Georgia, and Texas. It was rightfully held to be class legislation when motorists were taxed additionally for purposes that should be covered by general taxes.

The Uniform Vehicle Code proposed by the National Conference on Street and Highway Safety in 1920 and the Model Municipal Traffic Ordinance proposed by the same body in 1928, came before many of the State legislatures last year. To the end of 1929, approximately one-half of the States had adopted the code essentially, or had amended their laws to conform substantially therewith. Several cities had adopted the Model Municipal Traffic Ordinance. In an endeavor to bring about maximum uniformity in traffic rules and regulations, the States of New Jersey and

Wisconsin enacted substantially the entire Municipal Ordinance as a State code, governing all cities within those States. This was gratifying to the industry because it contributed to the convenience and safety of touring motorists and truck and bus operations that are interstate.

The trend was toward higher speed limits or the abolition of any limits, particularly in the open country, for safety no longer demands such restricted speeds as were necessary before four-wheel brakes were common and when roads were not designed for high-speed traffic. Express highways were being built that were wider, better surfaced, had banked long radius curves and few or no grade crossings, for the very purpose of accelerating the movement of traffic between cities, and so naturally, to make them effective, it was necessary to increase maximum speeds and in some places it was becoming the disposition to prescribe minimum speeds to increase the road capacity. Other trends were toward increasing allowable gross weight if carried on six-wheeled vehicles and discouragement of the use of solid tires, either by increased taxation, restriction of allowable weight, or outright prohibition. Oregon was to prohibit all solid tires after July 1, 1931.

The compulsory liability-insurance law made little headway, for conviction grows that it is not the safety measure it was hoped it would be and because it is found that it does not provide assumed compensation to the person who is injured, but merely assures collection of a judgment, if and when one can be secured. Accidents have not decreased where it has been put in effect and the newer laws of this sort do not compel the taking out of liability insurance until the driver has had an accident giving evidence of carelessness or incompetence. Then his license is revoked until he has established responsibility.

Bus regulation continued to present one of the knottiest problems for the law makers. The regulation of those doing an interstate business particularly calls for Federal legislation to avoid the hardships imposed on those that have to pass through States which may and have adopted unfriendly measures directed against vehicles registered outside of their confines. Several bills were before Congress but none had yet been accorded sufficient support to be enacted into law. While 37 States were regulating the truck used as a common carrier to a greater or less degree, it was almost the unanimous opinion of those closely in touch with such matters that the time had not arrived for the Federal regulation of such trucks.

**AZERBAIJAN**, a'zer-hi-jan' A new state constituted in 1918, consisting chiefly of the two former Russian provinces of Baku and Yelisavetpol, bounded on the east by the Caspian Sea, on the west by Georgia and Armenia, on the south by Persia, and on the north by Georgia, Northern Caucasians, and Daghestan. The official name of the state is the Azerbaijan Socialist Soviet Republic. Area, about 32,086 square miles and the population, according to the Soviet Union Year Book for 1929, 2,302,040, of whom 75 per cent were Moslem. Baku, the centre of the petroleum industry, is the capital and has a population of approximately 447,000. In 1925-26, 134,855 pupils attended primary and secondary schools. There were also trade-technical schools, teachers' training centres, higher educa-

tional institutions, and workers' faculties. The most important industry is the oil industry, which in 1927-28 produced 7,560,000 tons, as compared with 6,893,000 in 1926-27. The country is mainly devoted to agriculture, the chief products being grain, cotton, grapes, kitchen and garden produce, and some tobacco and silk.

In 1927-28 the number of members of industrial productive cooperatives in Azerbaijan was 12,400 as compared with 6200 in 1926-27. The production of the cooperatives in 1927-28 was valued at 31,400,000 rubles, and in 1926-27 at 18,100,000 rubles. After the outbreak of the Russian Revolution in 1917, Azerbaijan, Armenia, and Georgia formed a federation, but this broke up after a few weeks, when the three constituent elements each declared its independence. Two months after the *de facto* independence of Azerbaijan was recognized by Great Britain in 1920, the Bolsheviks overthrew it and established the Azerbaijan Republic (Apr. 28, 1920). During the first Transcaucasian Soviet Congress of Dec. 13, 1922, Azerbaijan united with the Armenian and Georgian Soviet Republics to form the Transcaucasian Socialist Federated Soviet Republic. A federal constitution accepted at the congress was published on Jan. 16, 1923.

**BADEN**, Baden. A constituent state of the German Republic, with a republican form of government since Nov. 22, 1918, formerly a grand duchy in the German Empire, bounded by Bavaria on the east and Alsace-Lorraine and the Palatinate on the west. Area, 5819 square miles; population in 1925, 2,312,462, as compared with 2,195,580 in 1919. Capital, Karlsruhe, with 145,694 inhabitants in 1925. The largest city is Mannheim with 247,480 inhabitants in 1925. Of the total population of the state in 1925, 1,115,477 were males and 1,196,985 females. The majority of the population is Roman Catholic. Education is free, general, and compulsory, the schools being under the jurisdiction of the state. For higher education, there are universities at Heidelberg and Freiburg. In 1927 the total area under cultivation was 2,061,747 acres. Among the agricultural products, oats, rye, barley, wheat, potatoes, and vegetables are the most important. In 1927, 30,315 acres were planted to the vine and the yield of wine was 3,959,098 gallons. In 1927, 12,522 acres were under tobacco and the corn crop was 373,850 metric tons. In 1928 there were 649,100 cattle, 467,700 swine, 46,400 sheep, 126,100 goats, and 69,600 horses. The budget for 1928 and 1929 fixed the ordinary revenue at 277,800,000 gold marks and the ordinary expenditure at 283,400,000.

The present constitution dates from Mar. 21, 1919, and vests the executive power in a cabinet comprising the state President, five ministers, and three state councilors without portfolios, all of whom are elected by the Legislature. Legislative power resides in a single chamber body known as the *Landtag*. The constitution abolishes all privileges of birth and religion and under it women are endowed with the same rights as the men, being eligible to all public offices. There is universal suffrage for all persons of either sex over 20 years of age. The initiative, referendum, and proportional representation have been introduced. The *Landtag* elected on Oct. 25, 1929, for the term ending Oct. 25, 1933, had 72 members, which included 34 Centrists, 18 Socialists, 6 Fascists, and 5 Communists. The

remaining seats were divided among the German Democratic party, the German People's party, the Right, and the Economic Union. The new cabinet consisted of Dr. F. J. Schmitt (Centrist), President and Minister of Finance, Dr. A. Remmele (Socialist), Minister of Justice and Education; Dr. Wittemann (Centrist), Minister of Interior.

**BADEN**, Prince of. See MAX, Prince of Baden.

**BAHAMAS**. A group of islands, north of the British West Indies, off the southeast coast of Florida, 29 in number, of which 20 are inhabited. They also include 601 keys and over 3000 reefs. The islands, which are of coral formation, have an area of 4404 square miles and a population, according to the census of 1921, of 53,031. The estimated population on Jan. 1, 1928, was 59,294. The important islands with their populations in 1921, are as follows: New Providence, containing the capital, Nassau, 12,975; Andros, 6976; Eleuthera, 6048; Long Island, 4659; Abaco, 3993; Exuma, 3730; San Salvador, 4273. Elementary instruction is compulsory between the ages of 6 to 14. For the calendar year 1927, the exports totaled £483,773 and the imports, £1,844,932. The principal exports were sisal, sponge, lumber, tomatoes, shells, and preserved pineapples; principal imports, foodstuffs, spirits, raw materials, building materials, and manufactured articles. For the fiscal year ending Mar. 31, 1928, revenues amounted to £485,319 (\$2,367,386) and expenditures to £673,986 (\$3,287,704). For 1926-27 revenues and expenditures were £531,235 and £474,653. The public debt on Mar. 31, 1927, was £154,105, the assets exceeding liabilities by £1,052,312. Ship entries in 1928, 1268 vessels of 678,482 tons, clearances, 1144 vessels of 675,942 tons. An annual line from the United States to the Bahamas was opened on Jan. 9, 1929. The islands are administered by a governor who is assisted by an executive council and a legislative council, each of nine members and a legislative assembly of 29 members, the franchise being based on a small property qualification. Governor and Commander-in-Chief in 1929 Maj. Charles William Orr.

A hurricane which swept the island on Sept. 20, 1929, caused the death of over ten persons at Nassau and damaged or destroyed virtually all of the houses in that city. Among the structures damaged were the Government House, the Bahamas General Hospital, several churches, and the new customhouse shed on the government pier. On September 25, a steamer was wrecked on Abaco Island with the loss of 31 lives. The sponge industry and the vegetable, fruit, and held crops of the islands also suffered severe damage.

**BAILEY**, JOSEPH WELDON. American lawyer and former United States Senator, died suddenly while pleading a case in court at Sherman, Tex., Apr. 13, 1929. Born in Copiah County, Miss., Oct. 6, 1863, he was admitted to the bar in 1883. A Democrat and strong adherent to the principle of State's rights, he was made presidential elector from Mississippi in 1884. The following year, he moved to Gainesville, Tex., and in three years Texas voted him presidential elector-at-large. He represented that State in the Federal House from 1891 to 1901. He was then sent to the Senate, where he became conspicuous for his independent, dominating personality, and where his persuasive eloquence, and his

thorough knowledge of constitutional law, made him, as an opponent of a free interpretation of the constitution, a leader of the conservative wing of the Democratic party. He resigned from the Senate in 1912, and resumed his law practice in Texas, also remaining active in politics, particularly in his opposition to the Wilson administration, and to Prohibition. Mr. Bailey ran unsuccessfully in 1920 as the anti-Wilson candidate for the governorship of Texas.

**BALTIMORE, Md., ANNIVERSARY.** See CELEBRATIONS

**BANKERS' ASSOCIATION, AMERICAN**  
The dominant national organization of banks in the United States, having a membership of more than 20,000 banks out of a total of 25,000, with assets estimated in excess of 90 per cent of the nation's aggregate banking capital funds of \$9,400,000,000 and total resources of \$72,000,000,000. The association has four major divisions, each devoted to the special interests, technical advancement, and general welfare of the following classes of banks: National, savings, State, and trust company. Within the organization, there are also two sections devoted to general banking interests: the American Institute of Banking section and the State secretaries section. The American Institute of Banking section, which is the educational arm of the organization, has an enrollment of 43,000 students from banks in all parts of the country and a general membership of 63,000, the State secretaries section forms a link between the national organization and the State Bankers' Association. The association has a protective department which prosecutes continually a nation-wide campaign of prevention, protection, and investigation for all member banks in respect to criminal operations. It also conducts a legal department which keeps bankers informed on developments in the field of banking law and, in connection with the association's State and Federal legislative committees and councils, watches the interests of banking institutions and the public in both State and Federal legislation.

During 1929 the organization gave special attention to maintaining equitable bank taxation and to the modernization of such taxation. Through its economic policy commission, it made an extensive research into the chain banking movement, disclosing the existence of 273 chain-bank groups comprising 1858 banks with \$13,275,000,000 in combined resources, together with much theretofore unknown information in this field. The educational foundation of the association completed raising a fund of \$500,000 to be employed in the furtherance of scholarships and research in banking and finance in educational institutions and allocated 200 loan scholarships in annual units of \$250 to students in colleges throughout the country. In addition, its public education commission conducted lectures on banking and business schools and civic clubs throughout the United States, and the commission on banking practices and clearing-house functions developed active studies and methods for more scientific bank management.

The association holds its annual convention in

the autumn of each year, while the executive council meets in the spring. The latter group is a representative body, proportioned to the membership in all States, and is qualified to take action upon certain association matters. The administrative committee, composed of 15 members, including the national officers, heads of the various divisions and sections, and certain others, acts as the *ad interim* governing authority between meetings of the convention and of the executive council. The 1929 convention was held in San Francisco, and the chief topics of discussion were the chain-bank movement and methods for improving bank management. The general national officers elected for 1929-30 were: President, John G. Lonsdale, president of the Mercantile-Commerce Bank and Trust Company, St. Louis, first vice president, Rome C. Stephenson, vice president of the St. Joseph County Savings Bank, South Bend, Ind., second vice president, Harry J. Haas, vice president of the First National Bank, Philadelphia, treasurer, Grant McPherrin, president of the Central State Bank, Des Moines, Iowa, secretary, William G. Fitzwilson. The continuing activities of the association are carried on by a permanent staff, functioning in the national headquarters at 110 East Forty-second Street, New York City, under the direction of the executive manager, Fred N. Shepherd.

**BANKS AND BANKING** The year 1929 was a period of exceptional importance and significance in connection with all banking, and particularly that of the United States, but the outstanding features of the period do not show on the surface, except under very close analysis, because of the fact that the turning point of the year came during the later months of the autumn, so that time was not given for the effect of important changes in conditions to show itself. On the surface, the characteristics of the twelve months were chiefly a continuation of the expansion movement, which had carried matters so far ahead during the preceding two years. After the close of October, very great changes in assets and liabilities occurred, as a result of the panic that broke out on the 23d of that month. These changes were chiefly seen in an immense exaggeration of loans, particularly loans on securities, but the immediate effects of this great change were short-lived, and within three weeks, figures had sunk back to about the level of the pre-panic period. They continued in the remainder of the year in a nearly "normal" condition, but factors tending to force a greater development of liquidity had now come into operation, and toward the close of the twelve-month, symptoms of change had begun to make themselves apparent, whose full meaning, however, was not yet positively determined at the close of December.

**NATIONAL BANKS.** The National Banking System did not reveal very great changes from the situation at the close of 1928, although it had become apparent early in the year that the same influences which were leading to the shrinkage, relatively speaking, of the national banks, and which had produced the McFadden Act of Feb. 25, 1927, were still at work and undergoing no material alteration. According to the report of the Comptroller of the Currency, published immediately upon the assembling of Congress in December, the total number of associations existing at the close of the report year (Oct. 31, 1929)

was about 201 less than a year earlier. As against the year 1928, when there had been a growth of \$1,200,000,000 in resources, a reverse movement occurred in the year 1929, the aggregate of re-

year, the total number being granted such powers during the twelvemonth being 69, while trust assets had increased \$940,000,000, or 28.52 per cent.

\* Includes rediscounts and customers liability under letters of credit

sources showing a loss of \$1,001,170,000 or a recession of about 3.58 per cent. Consolidations and combinations were as before, the chief factors in reducing the numerical growth of the system, while an unusual number of retirements also took place, and failures continued on about the same level as previously, the total number being seventy-nine, as compared with sixty-one in 1928.

According to the American Bankers' Association, which appointed a commission to study the subject especially, the year was a record breaking period in the development of chain and group banking, it being estimated by the Bankers' Association, that nearly 1800 institutions were controlled by groups and chains (at midyear) with about \$13,000,000,000 of assets, or nearly one-quarter of the active commercial banking resources of the System. The Bankers' Association did not state to what extent national banks figured in this group or chain of banking, but the indications were that they shared in it to the full proportion of their numerical strength, while in the cities they were engaged to an unusual degree in bringing about combinations and mergers which in a good many cases resulted in the acceptance of State charters, rather than national. The increasing tendency of national banks to take on trust functions continued during the

Brief analysis of the condition of national banks is furnished in the table in which the chief assets and the system are contrasted for a series of dates. From this showing, the continuous growth of operations characteristic during recent years is seen to have been brought to a halt and the decline both of deposits and of lending operations, already indicated in speaking of recession of gross resources, stands out conspicuously. For the report year 1929, the average earning of national banks (measured by capital and surplus) was approximately 8 per cent, and the total net addition to profit was \$437,000,000 or about \$51,000,000 more than the net increase for the preceding year.

**FEDERAL RESERVE MEMBERS.** The position of Federal Reserve member banks, included, as is well known, the facts as to a body of banks and trust companies, which comprise not only the national banks themselves but also about 1136 institutions organized under state charters. Inasmuch as this group of banks includes a large fraction of the entire body of assets of commercial banks, it affords a rather better reflection of actual changes in bank credit, than can be obtained from the national figures alone. The weekly report now covers about 600 representative members, situated in 100 cities.

SUMMARY OF MEMBER BANK POSITION

	Dec 31, 1929	Dec 24, 1929	Jan 2, 1929
Loans and investments—total	\$23,163,000,000	+ \$273,000,000 *	+ \$428,000,000
Loans—total	17,649,000,000	+ 344,000,000 *	+ 846,000,000
On securities	8,304,000,000	+ 373,000,000 *	+ 486,000,000
All other	9,344,000,000	- 30,000,000 *	+ 359,000,000

+ Increase - Decrease. \* Dec 24 figures revised.

Continuation of the great increase in operations of banks in general and particularly in loans and discounts, which had previously been so notable, is here reflected, notwithstanding, as already remarked, the powerful factors making toward liquidation, which had gone into force during the latter part of the autumn. It will be noted that the aggregate increase in loans for the year was \$846,000,000, notwithstanding that the loan account was already tremendously enlarged at the beginning of the year. Expansion of demand deposits had put this item ahead by \$135,000,000, even after the heavy drafts to which the banks had been subjected in November and December. The reduction in the borrowings from Federal Reserve banks reflects the status of the liquidation process that had begun to take effect late in the year.

**STATE BANKS AND TRUST COMPANIES** As in former years, the development of the state banks and trust companies, ran closely parallel to that of national banks. The table herewith given, however, relates to an earlier period (June 30, 1929), and is therefore not exactly compatible with the figures for Federal Reserve members (which include both national and State banks and trust companies). The great expansion of loans is noteworthy, while the growth of deposits on a lower ratio follows the same lines of development as in the case of the national banks. Decline of investment holdings in both classes of banks, reflects the fact that effort was being made by the leading institutions in both groups to rid themselves of some part at least of the tremendous burden of bonds and other securities which they had taken on during the boom period of the preceding two years. Analysis of both statements, strongly indicates that a definite turning point in the development of the assets and liabilities both of state and national institutions had been reached in 1929, inflation having been carried fully as far as it was at all safe to go

9 when the rate of discount was raised to 6 per cent, an action followed not long afterward by a similar measure on the part of the Bank of England. This advance, combined with the acceptance restriction, to which reference has already been made, was decidedly helpful in reducing the aggregate commitments of the banks, so that they reached the panic period, in October, with a substantial amount of free resources. These had been materially augmented by the fact that during the first ten months of the year, the Reserve institutions gained gold quite steadily, there being a net importation to the United States of about \$175,000,000.

During November and December, the tide turned, and a loss of \$112,000,000 occurred. Reserve banks, however, closed the year materially stronger in gold than they had been at the outset, notwithstanding that very substantial transfers of gold had been made from New York to the interior banks during and after the panic. The panic gave the signal for the abandonment of restrictive policies, and the discount rate was twice cut, bringing it finally to  $4\frac{1}{2}$  per cent. Meantime, very liberal purchases of Treasury bills and certificates, and of acceptances had been ordered, and the total volume of these classes of paper held by Reserve banks mounted rapidly. At the close of the year, the Reserve banks were holding fully \$400,000,000 of acceptances for their own account. The situation is reflected in the accompanying tabular statement showing the general position of the Reserve banks at the beginning and end of 1929.

One feature of the year in Reserve banking, which deserves to be very carefully noted, is the fact that during the year large withdrawals of funds were made by foreign bank and individuals who had previously sent them to the United States, with a view to shoring in the high rates of interest which were prevalent here. The panic which broke out in October, caused a great shock

\* Including overdrafts

**FEDERAL RESERVE BANKS.** Federal Reserve banks had entered the year 1929 in a much over-expanded condition. They had taken on a heavy burden of acceptances, and they were also largely involved in rediscounts, made during the period when they were furthering the inflation that had expanded all banks in the United States so very greatly during the two years preceding. The Reserve banks, soon after the opening of the year, began to send out warning letters to their members, in which they sharply cautioned the latter against new speculative engagements, or engagements to assist in maintaining a speculative position already assumed by clients. This period of warnings was accompanied by raising the rate for buying acceptances, and as a result, a large amount of this paper was gradually eliminated from the portfolios of the banks. The climax of the restriction period came on August

to confidence abroad, and many institutions hastily sent for their balances. Reserve banks had been in the habit of indorsing acceptances for foreign banks at a moderate commission whenever requested. They now broadened this policy, and indorsed a much larger number of acceptances than at any time in the past. At the close of the year, they had about \$500,000,000 of such indorsed acceptances, which they were carrying in their vaults in trust for the account of foreign, central, and private banks and bankers. Reduction of the discount rate toward the close of the year had some effect in preventing this outflow of funds, by convincing foreign bankers that conditions here were more conservatively managed than they had supposed. On the other hand, however, it tended to stimulate withdrawals in certain quarters because of the fact that after the panic, lending rates were no longer profitable in

## RESOURCES

	Twelve Federal Reserve Banks		
	Dec 31, 1929	Dec 31, 1928	Jan 2, 1929
Gold with Federal Reserve agents . . .	\$1,676,918,000	\$1,732,150,000	\$1,233,332,000
Gold redemption fund with U S Treasury . . .	73,287,000	73,787,000	73,693,000
Gold held exclusively against Federal Reserve notes	1,750,205,000	1,805,947,000	1,307,025,000
Gold settlement fund with Federal Reserve Board	511,243,000	489,879,000	685,346,000
Gold and gold certificates held by banks . . .	595,604,000	525,814,000	595,256,000
Total gold reserves . . . . .	2,857,051,000	2,821,640,000	2,587,627,000
Reserves other than gold . . . . .	158,877,000	129,106,000	180,898,000
Total reserves . . . . .	3,015,928,000	2,950,746,000	2,718,525,000

\* Revised figures

the New York market, so that better returns could be earned in almost any European market.

BANK CREDIT Reference has already been made to the panic of 1929, but a somewhat further explanation is necessary, with a view to making clear the inter-relation of bank credit with the investment situation. So-called brokers' loans, or loans on securities, made by banks to brokers had been increasing very rapidly, throughout the year 1928, but assurance had been given by the Federal Reserve authorities that they were not dangerously high. From the beginning of 1929 onward, these loans continued to expand, the total as reported by the New York Stock Exchange, eventually reaching a figure near \$8,550,000,000 in September. Immediately upon the outbreak of the panic, heavy withdrawals of call funds were made by non-banking lenders, while the banks themselves found it necessary to absorb a large part of these loans. The result was a tremendous process of shifting, while at the same time the rapid decline of stock prices reduced brokers' loans very greatly and continued to cut them back throughout the remainder of the year, the final total being nearly \$4,000,000,000 less than at the beginning of the twelvemonth. It should be noted that the growth in brokers' loans

was paralleled by a similar growth of loans based on securities throughout the whole body of banks of the country. These loans undoubtedly constituted a great menace to liquidity and were perhaps the outstanding feature of financial discussion during the year. The following figures reported by the New York Stock Exchange trace the development of the loan account.

## BROKERS' LOANS, 1929

BANK FAILURES There had been a decided recession in bank failures during the year 1928, and it had been expected that returns for 1929 would show a still further movement toward

normal. Instead of that, the tendency of bank failures was to increase quite materially, and the failures appeared to be growing more numerous among the larger banks, rather than, as in former years, primarily among the smaller. Experience showed that the so-called remedies proposed by the American Bankers' Association a year earlier were of no avail and toward the close of the year it began to be freely said by bankers that there would be no definite improvement in the failure situation except for the weeding out of weak banks through amalgamation with stronger institutions, either under group banking, chain banking, or under some modified system of chain banking. The accompanying figures summarize the development of the failure situation during the year 1929.

**BRANCH BANKING** A very decided change of opinion with reference to branch banking was to be noted during the year 1929. The two years prior to the opening of 1929 had been a transition period, in which there was an inclination to temporize with the whole subject. With the opening of the year, however, a fairly definite shift of view began to make itself felt. No definite advance in the branch situation was observable, and little progress under the MacFadden Law, which had allowed the establishment of city branches, was observable. For the entire year 1929, a total of new branches amounting to 173 was authorized, but at the close of the year, the Comptroller of the Currency in surveying the situation had to note that some eighty-six branches, established under the MacFadden Law had been closed, and that the total remaining in existence was only 1061. Although his predecessors in office had been vigorously opposed to branch banking, the comptroller now took a different attitude and in his report to Congress he made his appearance as a frank advocate of

branch banking, definitely requesting that Congress should authorize banks to establish branches practically anywhere within their own Federal Reserve district. Such action he asserted, would undoubtedly result in affording the community a better and safer banking system, and would probably tend to hold in the national system a good many banks which would otherwise leave it. The change of front thus indicated was too extreme to permit any immediate action to take place in Congress, and at the close of the year, legislators were still discussing the best course to be adopted.

**INTERNATIONAL RELATIONS** One striking development in international relations made its appearance in 1929. As the result of the Paris conference on reparations during the months of February and later, there had been developed a plan for an international bank, whose purpose it would be to take over the task of supervising reparations payments, but which would also serve as a joint agency for the central banks of the world, and for the clearance of accounts among them, as well as the establishment of a centralized management of their gold. It was proposed that this bank should be capitalized from contributions made from the central banks of several countries, of which the United States was to be one, but the plan met with the prompt opposition of President Hoover, and announcement was made that the Federal Reserve System would not be permitted to participate. Later conferences resulted in the acceptance of the international bank plan by practically all countries except the United States, so that at the close of the year matters were in a position to proceed. American bankers having been freely drawn into the conferences, it was assumed that in some way they would see to it that the resources of Federal Reserve banks were connected with, or made available to, the new bank. Other than this, and the continued withdrawal of foreign funds previously deposited in the United States, after the panic, the international banking relations of the United States were little altered.

**CONDITIONS AT CLOSE OF YEAR** The main problems at the close of the year in the American banking community were largely concerned with the final results of the panic, and the fact that country banks had been so little able to liquidate their loans on securities. The existence of a heavy draft on the gold of the nation, and the prospect of still larger shipments, naturally tended to cause doubt as to the extent to which this movement would go, and it was realized that, should it continue, as expected, the effect might easily be to bring about a rather embarrassing narrowing of the banking reserve of the country, already so small, relative to the total structure of bank credit as a result of the tremendous expansion of the deposits and loans of local banks. On the other hand, the brokers' loan situation had been largely corrected, and the worst of the fears entertained at the close of the year 1928 realized. The chief unfavorable expectation for the future, with the opening of the year 1930, was thus naturally seen in the possible growth of bank failures on a serious scale, due to prospective inability to liquidate.

**BANNARD, OTTO TREMONT** American lawyer and banker, died at sea, Jan. 16, 1929. Born in Brooklyn, N. Y., Apr. 28, 1854, he was graduated from Yale in 1876, and from the law school

of Columbia University in 1878. Being admitted to the bar, he practiced in New York until 1889, when he was appointed vice president of the Dolphin Jute Mills, becoming president the following year. He entered banking in 1893, as president of the Continental Trust Company, and when that concern merged with the New York Security and Trust Company, Mr. Bannard was made president, remaining with the firm as chairman of the advisory committee until his death. He also served as director of the Dolphin Jute Mills, the Herring-Hall-Marvin Safe Company, the Niagara Fire Insurance Company, and the Metropolitan Life Insurance Company, and he was a trustee of the Commonwealth Fund, and a member of the Board of Education of New York for two years. He was president of the National Employment Exchange, organized in 1900, and in July, 1918, was appointed chairman of the advisory committee to the alien property custodian. Mr. Bannard was defeated as the Republican candidate for mayor in 1909. Interested in charity work, he served as vice president of the Charity Organization Society of New York, and as trustee of the Provident Loan Society, and in 1916 he represented the American Red Cross and the war relief committee of the Rockefeller Foundation in the Balkan States. He was a fellow of the Corporation of Yale University until 1928. The honorary M. A. degree was conferred on him by that institution in 1908, and the LL.D. degree in 1924.

**BAPTISTS** In 1929 there were in the United States 14 groups comprised in the denomination known as Baptist, which maintains that baptism should be administered to believers only and generally by immersion. The first Baptist Church in America probably was established by Roger Williams in Providence, R. I., in 1639, although this honor is claimed by the First Baptist Church of Newport, R. I., organized the same year or shortly after. As a result of political differences, and particularly on account of the question of slavery prior to the Civil War, the Southern Baptists withdrew from the national organization in 1845, forming the Southern Baptist Convention, which, since that time, has functioned not as a new denomination but as an organization for the purpose of directing missionary and general evangelistic work in the White Baptist churches of the Southern States. The National Baptist Convention, representing the Negro churches, was formed in 1880. Other divisions were known as Primitive, General, Regular, and United Baptists.

According to the *American Baptist Year Book*, 1929-30, there were in the United States in 1929 a total of 55,603 churches of the Northern, Southern, and National (Negro) Baptist conventions, with 50,477 ordained ministers and 2068 local associations. Baptisms during the year numbered 319,911, making the total membership 8,729,025. Sunday schools numbered 47,233, with an enrollment of 5,152,016 pupils. Church property was valued at \$471,479,200, and contributions amounted to \$76,138,208, of which \$62,445,744 was for current expenses and \$13,692,554 for benevolence. The churches are congregational in polity, each church being sovereign as to its own discipline and worship. Applicants for the ministry are licensed to preach by the churches in which they hold membership.

**NORTHERN BAPTIST CONVENTION** In 1929 the Northern Baptist Convention, composed of 37

conventions in 35 States, reported 429 local associations, 8213 churches, 8805 ordained ministers, 61,147 baptisms during the year, 1,404,685 members, 7343 Sunday schools, 1,159,447 Sunday-school pupils, and contributions amounting to \$33,087,577. The twenty-second annual meeting of the Northern Baptist Convention was held in Denver, Colo., June 14-18, 1929, the general theme being "A Christ-like World." This convention marked the tenth anniversary of the New World Movement which was started in 1919. The keynote address was given by Dr. Avery A. Shaw, president of Denison University. Other important speakers were Bishop F. J. McConnell of the Methodist Episcopal Church, president of the Federal Council of Churches of Christ in America, Mrs. Honoré Willie Morrow, author of *Splendor of God*, a new biography of Adoniram and Ann Hasseltine Judson, and Dr. J. C. Massee on "Evangelism for a Christ-like World." The officers elected for 1929 were: President, Dr. Alton L. Miller of Boston, Mass.; first vice president, Prof. David J. Evans of Colgate-Rochester Divinity School, Rochester, N. Y.; second vice president, Mattison B. Jones of Glendale, Calif.; secretary, the Rev. Maurice A. Leitch of Mass.; recording secretary, the Rev. Clarence M. Gallup of Providence, R. I.; statistical secretary, the Rev. Charles A. Walker of Dover, Del.; and treasurer, Orin R. Judd of New York City. The next annual meeting was to be held in Cleveland, Ohio, May 28-June 2, 1930.

In 1929 the Northern Baptist Convention maintained 59 educational institutions, including 11 theological seminaries, 7 training schools, 22 colleges, 3 junior colleges, and 16 academies. These institutions in 1928 had 36,266 students, 2264 instructors, 542 buildings, property aggregating \$78,759,292 in value, endowments valued at \$107,002,902, and an annual income for the year of \$14,588,873. The foreign-mission field of the Northern Baptist Convention included Burma, Assam, South India, Bengal-Orissa, South China, East China, West China, Japan, Belgian Congo, and the Philippine Islands, 723 missionaries working at 126 stations. In 1927 churches numbered 2368 with 282,737 members, native workers, 9800, schools, 3903 with an enrollment of 149,377 pupils, and hospitals and dispensaries, 113 with a total of 24,404 in-patients and 285,227 out-patients.

In December, 1928, John D. Rockefeller, Jr., gave \$1,000,000 each to the Woman's American Baptist Home Mission Society and to the Woman's American Baptist Foreign Mission Society to further Baptist missions. The field of the home mission societies included, in addition to the United States and its dependencies, Mexico, the West Indies, Central America, and South America. Their greatest activity was among the Negroes, Indians, and new Americans. The denomination also maintained six hospitals, the largest being the New England Baptist Hospital in Boston and the Northwestern Baptist Hospital in St. Paul, 20 homes for the aged, and 15 children's homes. The official periodical of the Northern Baptist Convention is *The Baptist* (Chicago), other denominational papers are the *Watchman-Examiner* (New York City), *Baptist Observer* (Indianapolis), *Baptist Banner* (Parkersburg, W. Va.), and *Baptist Record* (Pella, Iowa). Headquarters of the American Baptist Publication Society are in Philadelphia.

**SOUTHERN BAPTIST CONVENTION** In the *Southern Baptist Handbook, 1929*, there were reported 17 State conventions, 24,274 churches, 22,700 ordained ministers, 183,020 baptisms during the year, 3,705,876 members, 21,399 Sunday schools, 2,797,129 Sunday-school pupils, 22,850 Baptist Young People's Unions with a membership of 500,564, contributions totaling \$59,927,910, and church property valued at \$205,705,949. The receipts of the boards of the convention in 1929 were as follows: Southern Baptist Foreign Missions Board (Richmond, Va.), \$1,428,666; Southern Baptist Home Missions Board (Atlanta, Ga.), \$854,184; Sunday-school board of the Southern Baptist Convention (Nashville, Tenn.), \$1,950,202; and ministers' relief and annuity board (Dallas, Texas), \$400,268. The denomination maintained 99 schools and colleges, including 5 theological schools, 31 senior colleges, 28 junior colleges, and 35 academies, with a total enrollment of 39,948 students, 1841 instructors, endowment valued at \$19,977,762, and property valued at \$40,136,689. It also reported 26 hospitals (two fostered by the Southern Baptist Convention and 24 by the State conventions) valued at \$15,122,740 and a . . . \$1,921 patients during the year, . . . homes with a property value of \$5,740,971 and accommodating 4588 children, and 3 homes for the aged.

Some far-reaching changes, both in the organization and in the leadership of the Southern Baptists, took place in 1929. Owing to the defalcation in 1928 of the treasurer of the home missions board, there was brought about a complete change of the personnel of the directors, as well as of their methods of operating the board. Another change ordered by the convention was the setting up of a minimum-operating budget to be based upon definite and specified amounts of money to be given to certain objects, rather than relying upon certain fixed percentages of the total receipts, to take care of the causes and institutions of the convention. A third radical change was the convention's decision to ask that the State convention and the churches, beginning Jan. 1, 1929, should forward all funds for South-wide or world-wide causes directly to the executive committee in Nashville, Tenn. The following officers were elected at the 1929 session of the Southern Baptist Convention, held in Memphis, Tenn., May 9-12: President, Dr. George W. Truett, Dallas, Tex.; vice presidents, Dr. W. A. Hewett, Jackson, Miss.; Dr. J. C. Hardy, Belton, Tex.; M. P. Love, Hattiesburg, Miss.; and the Rev. W. C. Reeves, Hot Springs, Ark.; secretaries, Dr. Light C. Moore, Nashville, Tenn., and J. Henry Burnett, Macon, Ga.

**NATIONAL BAPTIST CONVENTION (NEGRO).** In 1924 there was reported for the National Baptist Convention 728 local associations in 30 States, 21,712 churches, 17,743 ordained ministers, a constituency of 3,515,542 members, of whom probably 75,000 were baptized during the year, 17,592 Sunday schools with an enrollment of 1,448,250 pupils, and contributions amounting to \$3,537,000. Could statistics have been correctly reported, they would have revealed a Negro Baptist constituency approximating 5,000,000.

**OTHER GROUPS** In addition to several unorganized groups of foreign-speaking Baptists in the United States, there were the following organized bodies which held their own conferences:

German, Swedish, French-speaking Baptists of New England, Finnish Baptist Mission Union, American Magyar (Hungarian), Italian, Danish, Norwegian, Czechoslovak, Polish, Rumanian, Portuguese, and Russian-Ukrainian conferences. Spanish-speaking (Mexican) Baptists were well organized in some sections, North and South; and there were unorganized bodies of Chinese and Japanese Baptists. Statistics for these bodies in 1929 were as follows: Churches, 979; ministers, 848; baptisms, 4436; membership, 92,264; Bible schools, 941; Bible-school enrollment, 90,758; property valuation, \$12,366,700; and contributions, \$2,429,505.

Smaller branches of the denomination, differing in various respects from the main branches of the church, included the following Baptists. General Six-principle, Seventh-day, Free Will, United American Free Will (Colored), Free Will (Bullockites), General, Separate, Regular, United, Duck River, Primitive, Colored Primitive, Two-Seed-in-the-Spirit, Predestinarian, Independent Baptist Church of America, and American Baptist Association. The total number of members, according to the Federal Census of Religious Bodies of 1926, was 429,955. See also **BAPTISTS, FREE**.

In the Dominion of Canada there were three conventions, that of Ontario and Quebec; that of the Maritime Provinces, including New Brunswick, Nova Scotia, and Prince Edward's Island; and the Western Baptist Union, embracing Manitoba, Saskatchewan, Alberta, and British Columbia. In these conventions in 1929, there were 1260 churches, with 883 ordained ministers, 141,384 members, 4805 having been baptized during the year, and 1163 Sunday schools with an enrollment of 108,542 pupils. Property valuation, exclusive of Ontario and Quebec, aggregated \$5,822,200, and contributions for the year amounted to \$2,567,237, of which \$2,000,386 was devoted to current expenses and \$566,851 to missionary beneficence. In Mexico, there were 92 churches, 75 ordained ministers, and 6107 members, of whom 562 were baptized during the year.

The Baptist World Alliance, which was organized in 1905, meets every five years. A meeting was held in Toronto, Canada, in July, 1928. The relationship of the World Alliance to the Baptist churches is purely advisory, its purpose is the discussion of interests common to the denomination. The *British Hand Book* for 1929 prepared the following statistics of the denomination in 1928:

	Churches	Ministers	Members
America	58,080	50,978	8,931,956
Europe	8,157	4,700	1,690,366
Asia	8,231	1,645	859,160
Africa	1,247	390	78,751
Australasia	474	392	34,088
	71,139	58,195	11,040,321

**BAPTISTS, FREE** A branch of the Baptist denomination, which by 1929 had practically completed its policy of merging with the Northern Baptist Convention. There was but little independent activity of the Free Baptists, yet the General Conference of the Free Baptists, the national incorporated organization, still preserved its legal existence and powers. Estates in which life interests terminated or other entailments were removed were still coming to its treasury. The majority of Free Baptist ministers, churches,

and members were included in the enumeration of the Northern Baptist Convention. Alfred Williams Anthony was serving as corresponding secretary and treasurer. See BAPTISTS

**BAR ASSOCIATION, AMERICAN** A national association organized in 1878 to advance the science of jurisprudence, the administration of justice, harmony in legislation, and the observance of legal precedents throughout the United States, as well as to uphold the legal profession and promote good understanding among its members. The fifty-second annual meeting was held Oct 23 to 25, 1929, in Memphis, Tenn., and was attended by more than 2200 delegates. The retiring president, Gurney F. Newlin of Los Angeles, in his opening address, "Conservation of the Traditions of the Legal Profession," struck the keynote of the convention. To raise the ethical standards of the bar and qualifications for admission, and to simplify and lessen the lawyer's task by more uniform laws and lawful methods of law enforcement and more effective trial-by-jury procedure. The address of the Hon. Newton D. Baker, former Secretary of War, "The World Court," provided a valuable summary of the historical setting of the idea and a clear statement regarding the American reservation as to advisory opinions. Hon. Walter Simons, former President of the Supreme Court of the German Republic, gave renewed evidence of his understanding and appreciation of American constitutional arrangements in his address, "The Relation of the German Judiciary to the Executive and Legislative Branches." The recognized importance of proper educational requirements for admission to the study of law and the bar was attested by the symposium conducted by Judge William C. Coleman of the Federal District Court, Baltimore, Md., Emory R. Buckner of the New York bar, and Dean H. W. Arant of the Ohio University School of Law.

Among the decisions reached by the association on the various proposals submitted to it by the executive committee and the sections were the following: The adoption of a resolution condemning the conduct of law schools for commercial purposes, favoring making psychiatric facilities available for criminal and correctional courts, reaffirming its stand in favor of a legal and fair method of settling the disputes arising in industrial controversies connected with interstate commerce, expressing its approval of the creation of the President's Commission on Law Observance and Law Enforcement, approving the view of the committee on international law that the protocol of jurists seemed to offer full protection to American interests in the matter of advisory opinions, and approving a uniform securities act and amendments to the uniform vehicle act. Reports submitted and adopted at the convention included those of the commissioners of commissioners on uniform State laws and of bar association delegates, those of the sections on criminal law and criminology, legal education and admissions to the bar, mineral law, patent, trade-mark and copyright law, public-utility law, those of the standing committees on admiralty and maritime law, aeronautical law, American citizenship, commerce, commercial law and bankruptcy, insurance law, international law, jurisprudence and law reform, legal aid, noteworthy changes in statute law, professional ethics and grievances, radio law, and those of special committees on division of the eighth cir-

cuit, Federal taxation, judicial salaries, removal of government liens on real estate, and uniform judicial procedure.

The total membership of the association in 1929 was 27,620. The officers elected for 1929-30 were Henry Upson Sims of Birmingham, Ala., president, John H. Voorhees of Sioux Falls, S. D., reelected treasurer, and William P. MacCracken, Jr., of Chicago, reelected secretary. The headquarters of the organization are at 209 South LaSalle Street, Chicago. See CRIME.

**BARBADOS** An island colony of Great Britain, lying to the east of the Windward Islands, the most easterly of the Caribbean Islands. The area is 166 square miles and the population, according to the census of 1921, 150,312; estimated, Jan. 1, 1928, 168,299. The capital and chief city is Bridgetown, with a population of 13,486. In 1927 the average attendance in the elementary schools was 14,649 out of an enrollment of 22,732. Births (1927), 5317, deaths, 3401.

In 1927-28 the imports totaled £2,300,108, exports, £1,003,531, revenue, £414,884, expenditure, £481,252, and the public debt, £585,000. The principal imports in 1927 were cotton manufactures, fertilizer, flour, rice, dried fish, lumber and shingles; the principal exports were sugar, molasses, rum, raw cotton. The trade of the island was principally with the United Kingdom, the United States, and Canada. A governor administers the affairs of the island with the assistance of an executive council, an executive committee, a legislative council of nine members appointed by the governor, and an assembly of 24 members elected annually by the people. Governor in 1929, Sir W. C. F. Robertson.

**BARCELONA INTERNATIONAL EXPOSITION.** See EXPOSITIONS

**BARING, JOHN** See REYNOLDS, SECOND BARON OF

**BARLEY.** The barley production in 1929 of 30 countries reporting to the International Institute of Agriculture, Rome, not including the Soviet Republics and South American countries, was estimated at 1,335,109,000 bushels, a decrease of 17 per cent below the yield of 1928 and an increase of 26.8 per cent above the average production for the five years 1924-1928. The area in these countries was 57,068,000 acres, which was 5.8 per cent above the area of 1928 and 20.7 per cent above the five-year average. The yields of the leading barley-producing countries, exclusive of the United States, were as follows: Germany, 137,583,000 bushels; Rumania, 125,717,000; Canada, 100,467,000; Spain, 97,109,000; and Japan, 80,257,000. The Soviet Republics usually rank next to the United States in production. Argentina, by far the most important barley-growing country of South America, produced in 1928-29 nearly 17,000,000 bushels on an area of 1,462,000 acres.

The estimates by the Department of Agriculture of barley production in the United States were 307,105,000 bushels for 1929 and 357,487,000 bushels for 1928, as compared with a five-year average of 208,783,000 bushels. The increase in acreage from 1928 to 1929 was considerably below the large increases in several earlier years. In 1927 the area harvested was 9,476,000 acres, as against 12,598,000 acres in 1928 and 13,212,000 acres in 1929. The average yield was only 23.2 bushels per acre, or 5.2 bushels below that of 1928. The average farm price on Dec. 1, 1929, was 55 cents per bushel, or practically the same

as in the preceding year. On this basis, the total value of the crop was \$168,807,000, which was \$28,652,000 below that of the crop of 1928.

The production for the year of the leading barley-growing States, among the 35 reporting yields, was as follows: Minnesota, 59,400,000 bushels, South Dakota, 37,206,000, North Dakota, 36,210,000, California, 29,363,000, Wisconsin, 22,848,000, Iowa, 19,581,000; Nebraska, 18,892,000, Colorado, 13,671,000, Kansas, 12,464,000, and Illinois, 12,084,000. The production of all other States was placed at less than 10,000,000 bushels. The average yield per acre in the reporting States ranged from 14.2 bushels in North Dakota to 40 bushels in Utah. During the fiscal year ended June 30, 1929 the United States exported 56,996,000 bushels valued at \$48,069,000. The scab disease of barley caused losses in 1928 in sections of the Corn Belt States and the feeding of the scabbed grain to hogs was found to produce digestive troubles.

**BARNARD COLLEGE.** See COLUMBIA UNIVERSITY.

**BARRY, COMMODORE JOHN, ANNIVERSARY.** See CELEBRATIONS.

**BASEBALL.** The major league baseball contests in 1929 were without interest, as the Philadelphia club of the American League, the Athletics, won its race by a margin of eighteen games over the New York Yankees, erstwhile champions, and the Chicago Cubs of the National League won that pennant by a 10½ game margin over the Pittsburgh Pirates. The Athletics went on to win the World's Series from the Cubs, four games to one. The winners took the first two games, lost the third and then won the fourth and fifth contests when they seemed hopelessly lost. The features of the World's Series were that Connie Mack, leader of the Athletics, came back to win his first pennant in fifteen years, and that Howard Ehmke, a veteran, struck out thirteen Cubs in the first game of the series.

After the two championships had been practically settled by Labor Day, the interest centered on the battle for home-run honors in the National League which were finally won by Chuck Klein of the Philadelphia team, with forty-three. Melvin Ott of the New York Giants was next, with forty-two. Babe Ruth of the Yankees successfully defended his laurels by hitting forty-six home runs in the course of the season. Frank O'Doul of the Philadelphia team led the National League in batting with a mark of 0.389, while the American League was topped by Lou Fonseca, Cleveland first baseman, who hit for an average of 0.369. Other hitters who pressed these players for the honors were Herman of Brooklyn, Hornsby of Chicago, and Terry of New York in the National, and Simmons of Philadelphia, Manush of St. Louis, Fox of Philadelphia and Lazzeri of New York in the American League.

Bob Grove of the Athletics was considered the leading pitcher in the American League, with 21 victories and 6 defeats. In the National League the leader in the older league with 19 triumphs and 6 losses. Tom Zachary of the New York Yankees and Carl Hubbell of the New York Giants were other hurlers who turned in remarkable performances. The former went through the season without losing a game, winning twelve, while Hubbell had the distinction of winning twelve, but, no-run game.

The Athletics won the International League race, but lost the little World's Series to Kansas

City, champions of the American Association. The Albany Club won the Eastern League title.

College baseball again showed a great waning of interest, but the Holy Cross team stood out with a splendid record. Bots Nekola was the Worcester team's main pitcher. He signed a contract with the New York Yankees at the end of the season. In September the whole baseball world mourned the death of Miller J. Huggins, manager of the New York Yankees.

**BASKETBALL.** This winter sport showed a marked increase in ability to draw huge crowds and became more popular than ever in 1929. Thousands of industrial, Y M C A, school, and college fives played through long schedules. The championship of the Eastern Intercollegiate League was captured for the second successive year by the University of Pennsylvania, which gained permanent possession of the Arthur D. Alexander cup. Although Pennsylvania won the League race, the best team in the East was Fordham which went through a hard schedule with but one defeat. In three years, this team had lost but four games. In the Western Conference, the race was close with Michigan and Wisconsin tying for the leadership. Purdue was next. In the Far West Conference, the University of California team had the best record.

The National Amateur Athletic Union championship was again won by the Cook County Paint Company team over Kansas City, Mo. The Y M C A international championship was won by Buffalo Oak Park, Ill., was second. In the national High School Tournament held under the auspices of the University of Chicago, Athens High School, Texas, won the title. Classen High School of Oklahoma City was second.

**BATES, KATHARINE LEE.** An American author and educator, died in Wellesley, Mass., May 28, 1929. Born in Palmyra, Mass., Aug. 12, 1859, she was graduated from Wellesley in 1880. She then went to the Natick High School until 1881, then to Dana Hall in that year. Appointed an instructor in English literature at Wellesley in 1885, she became associate professor in 1888, and professor in 1891, holding that position until made professor emerita in 1925. Miss Bates received the A.M. degree from Wellesley in 1891, and the LL.D. degree in 1925, and the honorary Litt.D. degree was conferred on her by Middlebury College in 1914, and by Oberlin in 1916. She wrote the words for the national hymn, "America the Beautiful," and numerous volumes of poetry and prose, including the juvenile stories, *College Beautiful* and *Other Poems* (1897); *Rose and Thorn* (1889), *Hermit Island* (1891), *The English Religious Drama* (1893, 1902), *American Literature* (1898), *Spanish Highways and Byways* (1900, 1912); *From Gretchen Green to Land's End* (1907); *The Story of Chaucer's Canterbury Pilgrims Retold for Children* (1909); *In Sunny Spain* (1913); *Fairy Gold* (1916); *The Retinue, and Other Poems* (1918), *Sigurd, Our Golden Collie and Other Comrades of the Road* (1919); *Yellow Clover* (1922); *Little Robin Stay-Behind, and Other Plays in Verse for Children* (1923); and *The Pilgrim Ship* (1926). Miss Bates also edited, among many others, editions of the *Early Poems of Alice and Phoebe Cary* (1903), *Hollywood's A Woman Killed With Kindness, and The Fair Maid of the West* (1917). She translated, with Cornelia Bates, *Beccaria's Romantic Legends of Spain* (1909).

**BATES COLLEGE.** A nonsectarian college for men and women in Lewiston, Me., founded in 1864. The enrollment for the autumn term of 1929 was 632, of whom 378 were men and 254, women. In the 1929 summer session, there was a total of 275 students, of whom 121 were men and 154, women. The faculty and administrative officers numbered 50. The permanent funds amounted to \$1,800,000, total expenditures for the year were \$281,607; and the budget involved an appropriation of \$292,991. The library contained 57,375 volumes. President, Clifton Daggett Gray, Ph.D., LL.D.

**BATTLE CRUISER.** See NAVAL PROGRESS

**BATTLESHIPS.** See VESSELS, NAVAL

**BAUER,** COL. MAX German soldier and military adviser to the Chinese Government and military leader in the World War, died in Shanghai, China, May 6, 1929. Joining the German Army, 1890, he became an officer in the field artillery, and from 1908 to 1912, he was a member of the general staff working on the development of heavy artillery. From 1914 to the close of the World War, Colonel Bauer was in the operations section of the general staff. In 1920 he was forced to leave Germany because of being involved in plots against the Republican government, but was allowed to return in 1925. He was offered the post of military adviser to China in 1928, and he was active in overcoming the opposition to the Nanking government. See CHINA

**BAUMES LAWS** See CRIME

**BAVARIA.** A constituent state of the German Republic, formerly a kingdom within the German Empire, ruled for more than a century by the Wittelsbach dynasty, which was deposed after the revolution following the World War. The new state adopted a republican form of government on Nov. 22, 1918. Area 29,334 square miles, population according to the census of 1919 7,140,340, according to the census of 1925, 7,379,594. Chief cities: Munich, with a population of 680,704 in 1925; Nuremberg, 392,494; Augsburg, 165,522; Ludwigshafen, 101,869. In 1927 there were 58,449 marriages, 150,782 births, and 96,989 deaths. The religious division of the population of Dec. 1, 1925, was: Roman Catholic, 5,164,786; Protestants, 2,110,327; Jews, 49,163. Education is compulsory between the ages of 6 and 16. In 1927 the chief crops were: wheat, 680,242 acres, 449,804 metric tons; rye, 997,105 acres, 544,875 tons; oats, 1,077,505 acres, 644,318 tons; potatoes, 947,580 acres, 5,165,410 tons; vines, 49,687 acres, 9,058,610 gallons; hops, 32,220 acres, 6841 tons. The census of livestock, on Dec. 1, 1928, showed 402,200 horses, 3,812,800 cattle, 393,200 sheep, 2,081,800 swine, and 354,300 goats. Production of coal during 1927 was 2,144,540 metric tons; pig iron, 302,539 tons; cast iron, 202,475 tons; sulphuric acid, 327,251 tons.

The ordinary budget for the year 1928 provided for a revenue of 748,965,640 marks and an expenditure of 774,565,640 marks. The extraordinary budget balanced at 30,062,000 marks. The public debt at the end of the financial year 1927 was 1,997,500,847 paper marks or 297,568,069 Reichsmarks (par value of Reichsmark is \$0.2382).

The constitution dates from Aug. 14, 1919. Under it, the supreme power is vested in the people, who are represented by the Diet of one Chamber elected for four years on a basis of universal, equal, direct, secret, and proportional suffrage, all citizens over 21 years of age having

the right to vote. There is one representative for every 62,000 inhabitants, making a Legislature of 129 members. The membership of the Bavarian Landtag, as constituted following the election of May 20, 1928, follows: Bavarian People's party, 46; Social Democrats, 34; National Socialists, 9; German Nationalists, 13; Bavarian Peasants' and Middle-Class Union, 17; German People's party, four; Communists, 5. The cabinet as constituted in 1929 was as follows: Premier and Minister of Foreign Affairs, Dr. Held; Education, Herr Goldenberger; Agriculture and Labor, Professor Fehr; Interior, Herr Stuetzel; Finance, Dr. Schmelzle; Justice, Herr Gurtner.

**BEAL,** ALVIN CASEY American floriculturist and educator, died in Ithaca, N. Y., May 7, 1929. He was born Nov. 30, 1872, in Mt. Vernon, Ill., and was a member of the horticultural division of the Illinois Experimental Station until 1900, when he became an instructor of floriculture at the University of Illinois. After 1913 he was a professor at Cornell University. He specialized in the culture of gladioli and wrote *The Gladiolus* (1927).

**BEAUX-ARTS INSTITUTE OF DESIGN.**

A school of fine arts in New York City, planned after the *École des Beaux-Arts* in Paris. It was organized in 1916 by the Society of Beaux-Arts Architects for the purpose of furnishing "instruction in the arts, under the Regents of the State of New York, at a minimum cost to students, to bring art students under the criticism of artists who are engaged in active practice, to carry students beyond the academic study of the arts into the province of their application and practice, and to bring about cooperation among the various art schools of the country." Working under the auspices of the institute during the year 1928-29 were 2146 architectural students, 200 students of sculpture, and 75 students of mural painting. Except in the case of the Paris Prize competitions, there are no restrictions as to the nationality or age of entrants.

The institute maintains a department of sculpture, the courses offered including life modeling and architectural sculpture, architectural ornament, antique modeling, composition, and sketching. The instructors are sculptors of high standing, who volunteer their services: those in the life classes each serving a term of three months and those in the architectural-ornament classes, a term of one month or more depending on the duration of the treatment of the style which is the subject of the study scheduled. A department of architecture also is maintained for the purpose of furnishing systematic training in architectural design for draughtsmen in offices and for students of architecture in general.

Prizes in architecture, sculpture, and mural painting are offered to students throughout the United States. During the year 1928-29, the committee on education in the department of architecture conducted 29 competitions for the study of architecture and six for the study of archaeology, in addition to the three competitions for the Paris Prize. The most important of the various prizes and scholarships offered to students through the institute is the prize amounting to \$3600, given by the Society of Beaux-Arts Architects, which affords two and one-half years' study in architecture at the *École des Beaux-Arts* in Paris. (All the competitors, including the winner, in the final competition re-

ceive \$150 each provided their work is considered satisfactory) There is also the Paris Prize in Sculpture, representing a scholarship of \$1200 for one year's study in Paris

The institute issues a monthly *Bulletin* in which are published the results of all contests, with reproductions of the best designs submitted Officers elected at the annual meeting in November, 1929, were Director, Whitney Warren; secretary, Henry R Sedgwick, director of architectural department, Philip A. Cusachs, director of department of sculpture, Edward McCartan, director of department of mural painting, J Monroie Hewlett, chairman of the board of trustees, Benjamin W. Morris, vice chairman, William Adams Delano Headquarters are at 304 East Forty-fourth Street, New York City.

#### BEEF. See LIVESOCK

**BEER-WALBRUNN, ANTON.** A German composer, died in Munich, Mar 23, 1929 He was born at Kohlberg, Bavaria, June 29, 1864, and received his musical training at the Akademie fur Tonkunst in Munich In 1901 he joined the faculty of this institution as professor of composition His works consist of four operas *Die Sühne* (Lubeck, 1894); *Don Quichote* (Munich, 1908), *Das Ungeheuer* (Karlsruhe, 1914), and *Der Sturm* (not produced); *Symphonie in E, Symphonische Fantasia, Lustspielouverture, Wolkenkuckuckheim*, three burlesques for orchestra, a violin concerto, a choral work with orchestra, *Mahomets Gesang, Der Polenfluchtling*, for haritone and orchestra, incidental music to *Hamlet* and *The Tempest*, numerous male and mixed choruses, and some chamber music

#### BEEFLES. See ENTOMOLOGICAL, ECONOMIC

**BEGBIE, HAROLD** English author and journalist, died in London, Oct 8, 1929 Born in Farnham St Martin, Suffolk, in 1871, he was privately educated and at the age of 20 went to live in Devon, from there sending contributions to papers in London In 1914 he visited America, where he won attention by his vigorous defense of the English cause in the World War and by articles sent to London, warned the British of German propaganda in America All his writing was of a didactic, social, or political nature The authorship of his *The Mirrors of Downing Street* (1920) written under the nom de plume "The Gentleman with the Duster," studies of well-known figures of English public life, was kept a secret from a curious public He was a prolific writer, being connected first with *The Globe* and later with *The Daily Mail* in London, and writing novels, biographies, literary criticisms, and political papers. A well-known biography, *The Life of William Booth, Founder of the Salvation Army* (1920), was written from personal knowledge of Booth and his work

**BELGIUM.** A kingdom of western Europe, situated between France and the Netherlands Capital, Brussels, reigning monarch in 1929, Albert I.

**AREA, POPULATION, ETC** The total area, including the districts of Eupen and Malmédy, which were ceded to Belgium after the Treaty of Versailles, is 11,755 square miles The population --- to the official census of 1920, was 7, --- estimated, Jan 1, 1929, at 7,995,558, which represented a density of 680 per square mile The chief cities with their populations as of Jan 1, 1928, are: Brussels (with suburbs), 815,198; Antwerp, 300,001; Liège, 168,823; Ghent, 163,207. The movement of population

in 1927 was Births, 145,275, deaths, 106,751; marriages, 71,921 The emigrants in 1927 numbered 29,941 and the immigrants, 41,169

**EDUCATION** For primary instruction, there were in 1928, 8350 primary schools, with 803,620 pupils, 3666 infant schools with 245,650 pupils; and 1941 adult schools with 56,510 pupils For higher education, there were 24 atheneums and colleges, with 8020 pupils, five special atheneums, with 374 students, four communal and provincial colleges, with 2017 students, and ten private colleges, with 1609 students The next grades of schools are the higher grade schools, of which there were 134 State schools, with 27,000 pupils, 15 communal and provincial schools with, 5182 pupils, and eight private higher grade schools, with 1022 pupils There are six normal schools for training secondary school-teachers (448 students) and 80 for training elementary school-teachers (8617 students) There are many private and free schools, mostly under ecclesiastical care For collegiate education, there are universities at Brussels (1945 students in 1927-28); Ghent, 1551, Liège, 2278, and Louvain, 3551, and the Colonial University at Antwerp

**PRODUCTION, MINERAL RESOURCES, ETC** Of the total area of 2,945,104 hectares, there were in 1926, 1,786,750 hectares under cultivation, of which 38.98 per cent were under cereals, 1.18 per cent under vegetables, 5.58 per cent under industrial plants, 13.80 per cent under root crops, and 40.46 per cent under forage The acreage and yield of the principal crops in 1927 were as follows: Wheat, 389,000 acres, 14,449,000 bushels; barley, 78,000 and 3,637,000, rye, 573,000 and 20,078,000, oats, 657,000 and 43,991,000, potatoes, 416,000 and 11,359,000, sugar beets, 175,000 acres, 1,083,000 metric tons, fodder beets, 191,000 and 4,732,000, tobacco, 8000 acres, 13,492,000 pounds On Jan 1, 1928, there were 256,465 horses, 1,738,714 horned cattle, and 1,124,243 swine The most important industries in Belgium are artificial silk, automobiles, glass, iron and steel, lace, linen, and gloves In 1927 there were 54 sugar factories with an output of 259,490 tons of raw sugar, 19 sugar refineries, output, 160,124 tons, 37 distilleries, output 43,300 kiloliters of alcohol, 1844 breweries, output 1,325,685 kiloliters of beer, 15 margarine factories, output, 34,814 tons, 56 vinegar factories, output, 12,668 kiloliters, 19 meat factories, output, 69,733,000,000 matches In 1926, 13,082 industrial concerns employed 1,080,331 workers, of whom 874,309 were men and 206,022, women There were, in addition, 96,567 salaried officials

Mineral production has always been an important industry in Belgium The country has natural resources of coal and zinc and after the economic union with Luxembourg in 1922 gained ready access to iron ore On the whole, 1928 was a favorable year for the Belgian coal industry The critical situation confronting the industry in 1927 improved steadily, prices recovering to a moderate degree, and the individual output of the miners increasing considerably A policy of amalgamation pursued by coal and coke companies culminated in January, 1929, in the formation of organizations controlling much of the output of coke and industrial coal, which planned to unite their forces for the improvement of the industry With more favorable prices during 1928, stocks decreased from 1,847,000 to 1,088,000 tons, leaving the coal mines of the Kingdom in a better position to resist price cuts.

The principal coal deposits in Belgium are in the vicinity of Charleroi. Next in order come the mining centres of Mons, Liège, Centre, Limburg, and Namur. Coal production during 1928 totaled 27,642,780 metric tons, or 30,770 tons less than in 1927. The coke output was 5,924,000 metric tons, an increase of 530,080 tons over 1927, setting a record for the country. Briquet production increased to 1,901,000 tons. See COAL.

The output of other minerals in 1928 was pig iron, 3,905,320 metric tons, steel, 3,820,910 tons, wrought steel, 3,378,490 tons, and crude zinc, 209,280 tons.

The cement industry experienced a generally satisfactory year, both the domestic and export demand remaining good throughout 1928.

A labor shortage developed during 1928 which became more acute in 1929, a rapid rise in wages resulting. The shortage was attributed to the continuance of the low war-time birth rate and the immigration of laborers to France. In June, 1929, there was a shortage of 10,000 workmen in the Charleroi district alone, and mining companies were obliged to establish recruiting agencies abroad.

COMMERCE In commerce, as well as in industry, 1928 was a year of marked prosperity in Belgium, the country showing an almost complete readjustment to currency stabilization and to general postwar conditions. Practically all major lines of manufacture were stronger at the close than at the beginning of the year. The internal markets were satisfactory with improved purchasing power, and the foreign markets expanded considerably. As a result, the adverse trade balance for 1928 was the smallest recorded for many years. Exports amounted to 39,145,421,000 paper francs and imports to 31,664,240,000 paper francs, as compared with exports of 26,196,614,000 francs and imports of 29,188,507,000 francs in the preceding year. It was anticipated, however, that the rising wage scale due to the labor shortage experienced in 1928 and 1929 would lessen the advantage which Belgian manufacturers have hitherto held over competitors in foreign markets. This was confirmed by the returns for 1929, showing an adverse balance of 3,276,000,000 francs, with imports totaling 35,510,000,000 francs and exports, 32,234,000,000 francs.

Imports from the United States fell off during 1928, amounting to 2,913,236,000 francs, as compared with 3,200,393,000 francs the previous year. This was due largely to lower cereal purchases. Imports of some other lines showed substantial increases. Exports to the United States rose to 2,427,960,000 francs in 1928 from 2,420,864,000 francs in 1927. Trade with other leading countries in 1928 was as follows: France, imports from, 6,625,048,000 francs, exports to, 3,907,730,000 francs, United Kingdom, imports from, 3,766,666,000, exports to, 5,184,812,000, Netherlands, imports from, 3,333,664,000, exports to, 3,479,281,000, Germany, imports from, 3,925,586,000, exports to, 4,236,197,000, Argentine Republic, imports from, 2,318,270,000, exports to, 1,114,513,000.

The bulk of Belgian imports in 1928 were raw materials, provisional figures placing the value of these imports at 16,592,427,000 francs, foodstuffs and beverages at 6,794,598,000 francs, manufactures at 7,996,794,000 francs, live animals at 61,342,000 francs, and gold and silver bullion and coin at 119,079,000 francs. The exports were mainly manufactures, the respective

values in 1928 being: manufactures, 17,508,044,000 francs, raw materials, 9,876,857,000 francs, foodstuffs and beverages, 2,528,710,000 francs, live animals, 157,612,000 francs, and gold and silver bullion and coin, 74,299,000 francs.

FINANCE The budget estimates for 1929 (ordinary and extraordinary) called for revenues of 11,485,080,000 francs and expenditures of 10,253,206,000 francs, as compared with revenues of 10,563,562,000 francs and expenditures of 9,282,731,000 francs in 1928. In the 1929 budget, the total of all ordinary receipts was placed at 9,543,161,000 francs, including direct taxes, 2,821,250,000 francs, customs and excise, 1,874,300,000 francs, stamp duties, 2,307,500,000 francs, succession duties, 1,025,000,000 francs, and tolls, 23,750,000 francs. Included in the total for ordinary expenditures of 8,233,328,000 francs were public debt, 2,923,260,000 francs, foreign affairs, 76,235,000 francs, justice, 299,468,000 francs, science and arts, 866,111,000 francs, public works, 195,936,000 francs, social insurance, 696,661,000 francs, national defense, 846,631,000 francs.

The budget adopted for 1930 provided for ordinary and extraordinary expenditures of 11,513,669,000 Belgian francs (exchanging at \$0.0278) and for total revenues of 11,561,008,000 Belgian francs, leaving an estimated surplus of 47,849,000 francs. The budget incorporated tax reductions of approximately 1,600,000,000 francs, including 645,000,000 francs applied to direct taxes, 25,000,000 francs to customs and excises, 160,000,000 francs to inheritance taxes, and 770,000,000 francs to registration, stamp, and transmission taxes. In spite of these reductions the tax revenue for 1930 was estimated at 8,309,770,000 francs, as against the 1929 estimate of 8,028,350,000 francs. The budget was relieved of more than 1,000,000,000 francs through the completion in the 1929 fiscal year of the establishment of a debt-amortization fund. Under the Young plan reparations from Germany were estimated at 901,130,000 francs in 1930, as compared with estimates of 1,180,930,000 in 1929, but annual receipts from Germany were expected to increase through the payment of war-time German marks left in Belgium. The estimates omitted accounts for the administration of the telegraph and telephone services which were to be turned over to private operation.

The Belgian public debt on Sept. 30, 1928, amounted to 35,366,287,198 Belgian francs, divided as follows: internal long-term debt, 22,188,885,327 francs, internal short-term debt, 4,855,734,805 francs, total internal debt, 27,044,620,132 francs, external long-term debt, 28,321,667,066 francs. Between Sept. 30, 1928, and the same date in 1929, the debt was reduced by 1,349,896,000 francs, despite the issue of new internal bonds to the amount of 247,000,000 francs.

COMMUNICATIONS The Belgian government-owned railways began operation as a private company on Sept. 1, 1926, under the company name of Societe Nationale Chemins de Fer Belges. The length of the lines owned by this company, as of Jan. 1, 1928, totaled 6460 miles, of which 2988 miles were main line and 3483 miles branch line. There were 280 miles of private line. In 1927 the gross receipts of the government railways were 2,885,800,000 francs (\$80,288,000). Operating costs were equivalent to 82 per cent of the receipts. While the volume of traffic was considerably less than in 1926, the total re-

ceipts represented a 30 per cent increase over receipts for 1920

The Belgian inland waterways are navigable over 1040 miles and their traffic exceeds 28,000,000 metric tons annually. The Belgian Parliament by the law of Aug 13, 1928, provided for the central administration of the affairs of these waterways which, with the introduction of motor power since the World War, have new importance in Belgian trade and transportation. The programme of motorization calls for 300 hauling tractors in service in 1931. The number of vessels entering Belgian ports in 1927 was 18,684 of 27,825,095 tons, cleared, 18,713, of 27,828,989 tons. In 1928, 11,333 vessels of 23,004,634 tons entered the port of Antwerp. Excellent facilities for the handling and storage of goods and its communications with the interior and with other European ports have made Antwerp one of the leading entrepôts of trade for central Europe. The harbor recently was enlarged by the opening of a new canal dock 3 miles long and 985 feet wide, which, at high tide, would receive ocean liners drawing over 40 feet. The traffic of the port increased from a total of 14,146,819 net tons in 1913 to 24,326,939 in 1929.

GOVERNMENT Belgium is a constitutional, representative, and hereditary monarchy. Executive power is in the King, acting through a responsible ministry, legislative power is in the King and two chambers, namely the Senate and House of Representatives. The former is elected partly by the direct and partly by the indirect vote of the people, the number being equal to half the number of members of the Lower House and proportioned to the population of each province. Those elected indirectly are chosen by the provincial councils. The parties in the senate elected in May, 1929, were Catholics, 41, Liberals, 13, Socialists, 36. The 180 members of the Lower House are elected by universal suffrage directly for four years. The party alignment in the House was Catholics, 76, Socialists, 70, Liberals, 28, miscellaneous, 13. The reigning monarch in 1929 was Albert I, who succeeded his uncle, Leopold II, Dec 17, 1909. The cabinet as appointed Nov 22, 1927, was composed as follows: Prime Minister and Minister of the Colonies, Henri Jaspar (Catholic), Foreign Affairs, Paul Hymans (Liberal), Justice, M Janson (Liberal), Education, Maurice Vauthier (Liberal), Finance, Baron Houtart (Catholic), Agriculture and Public Works, Henri Baels (Catholic), Industry, Labor, and Social Insurance, M Heyman, (Christian Democrat), Railways, Marine, Posts and Telegraphs and Aeronautics, M Lippens (Liberal), National Defense, Comte de Broqueville (Catholic), Interior, M Canoy (Christian Democrat).

HISTORY Two outstanding problems engaged the attention of Belgium during 1929—efforts to reach an agreement with the Netherlands giving Antwerp improved access to the sea and the movement of the River Scheldt, and the Flemish movement.

The Flemish movement produced repercussions (throughout the social and political life of the nation, among them being the resignation of the Jaspar cabinet on November 25 over the failure to obtain Liberal support for the government bill on the language question in Ghent University. Other issues were the Flemish language question in the army, and the political problems arising from the exclusion of Dr August Borms from

the Belgian Parliament in December, 1928, because of his pro-German activities during the World War. Dr. Borms, a leader of the Flemish separatist movement, was elected to Parliament from Antwerp Dec. 9, 1928. He was in prison at the time and had been sentenced to the loss of his civil rights for serving as a member of the Council of Flanders during the German occupation, but nevertheless defeated his Liberal opponent by nearly two to one. An amnesty law was passed by Parliament January 16 under which Borms was released from prison the following day. These events were climaxed by two great demonstrations by Flemist Nationalists in Antwerp.

The Flemish Nationalist party, which was organized in 1919, made considerable gains in the elections of May 26, 1929, winning its first seats in the Senate. A section of Flemish public opinion would apparently be satisfied with reforms, but there was a strong demand in some quarters for complete separation from Belgium. The Roman Catholic bishops were reported to have attempted to deter Catholic voters from supporting Nationalist candidates. The Flemish autonomist members of the new Chamber announced that they had abandoned complete independence as their goal and would henceforth seek the establishment of a federated state in which the Flemish provinces would enjoy administrative autonomy under King Albert. The nationalistic agitation centres to a considerable extent in the demand that Flemish be made the recognized language where Flemings predominate.

French is spoken in the Walloon provinces, containing about half of the population of Belgium, and the inhabitants are reluctant to learn Flemish. The seaboard provinces are inhabited mainly by Flemish fishermen and peasants who refuse to learn French. In other Flemish provinces, the people speak both Flemish and French. The government bill which resulted in the resignation of Premier Jaspar and his Catholic-Liberal coalition cabinet provided that the regular classes in Ghent University should be conducted in Flemish, but offered to those desiring French optional courses in that language. The Liberal members of the cabinet, representing the French cultural elements, refused to support the bill without first submitting it to their party, whereupon the Premier resigned. M Jaspar was asked by the King to form a new Ministry, which he consented to do on December 3.

Little apparent progress was made toward the settlement of the dispute with Holland, which indirectly involves the commercial rivalry between Antwerp and Rotterdam. Antwerp is on the Scheldt, which leaves Belgian territory below the city and flows through Holland to the sea. By the treaty of 1839, Holland assumed responsibility for the improvement of the river to meet the demands of traffic, but since the beginning of the present century, the Belgians have complained that not enough was being done in this connection. In the meantime, Rotterdam had grown much faster than Antwerp, which was not readily accessible to the larger ships. Besides the commercial rivalry involved, the Dutch were said to be reluctant to see the Scheldt made accessible to large warships in view of the fact that Belgium was no longer a neutralized country. The Dutch agreed to further dredging of existing channels, but the Belgians wanted modification of the Treaty of 1839 to permit the dredging of a canal between Antwerp and Moerdijk. The

Dutch Cabinet consented to this in 1925, but the Senate rejected the draft treaty. Negotiations were reopened in September, 1928, and were continued intermittently during 1929 without an agreement being reached.

Early in 1929, Belgium ratified the Kellogg-Briand Pact by the unanimous action of both the Senate and Chamber of Deputies. A treaty of arbitration and conciliation was also concluded with the United States.

Laws regulating the sale of liquor, enacted during the previous Socialist administration, were attacked in the Chamber of Deputies on the ground that they had resulted in fraud and the multiplication of night clubs where illicit sales of alcohol were made. A committee of inquiry reported on July 10 in favor of maintaining the so-called "blue laws" and extending them in some respects. The cabinet was enlarged by the addition of three members on October 18. Besides the gains made by the Flemish Nationalist party, the election of May 26 was marked by an increase in the Liberal and a decrease in the Catholic representation in the Senate and Chamber. The Liberals opposed the "blue laws." For the composition of the new Parliament, see under *Government* above. On October 18, three new members were added to the cabinet.

The engagement of Princess Marie José, daughter of King Albert, and Crown Prince Humbert of Italy, was announced in November. The date of the wedding was set for Jan. 8, 1930.

A severe crisis on the Belgian bourse followed the break in the New York Stock Exchange in November. An 80,000,000-franc consortium to support the market over the monthly settlement date was formed by a group of important banks. A general economic crisis due to the excess of imports from the United States over exports to that country were voiced in the Belgian press. The American tariff was held largely responsible. Unsettled political conditions and the cabinet crisis late in the month added to the general uncertainty and lack of optimism, although production was maintained at a high level.

Belgian troops evacuated Aix-la-Chapelle and other towns in the second zone of the occupied area of the Rhineland on December 1, in accordance with the agreement reached with Germany at The Hague Reparations Conference during the summer. For Belgium's part in the reparations settlement, see *REPARATIONS*.

**BELGIAN INTERNATIONAL EXPOSITION.** See *EXPOSITIONS*.

**BELL LABORATORIES.** See *PHYSICS, TELEPHONY*.

**BENZ, KARL.** German mechanical engineer and pioneer in the motor-car industry, died Apr. 3, 1929, in Ladenburg, Germany. He was born in Karlsruhe, Germany, on Nov. 25, 1844, and studied at the technical college there. On finishing his course, he worked in an engine factory. In 1878 he developed a two-stroke internal-combustion engine, and founded a factory to manufacture engines of this type. Later, he established the firm Benz & Co., and in 1885 he built and demonstrated a three-wheeled motor vehicle with an internal-combustion engine, filing a patent for it the following year. There were many scientists at work simultaneously on the development of the motor car, but Karl Benz shared with Gottlieb Daimler, also a German, the credit of building the first complete vehicles propelled by internal-

combustion engines. Daimler's car, which was four-wheeled, was patented in 1885-86. Benz also developed a high-speed, four-stroke engine. His inventions had an important place in the growth of the motor-car industry.

**BEREA COLLEGE.** A nonsectarian, coeducational institution in Berea, Ky., founded in 1855 and designed to serve the educational needs of the mountain people of the Southern Appalachian region. The enrollment for the autumn of 1929 was 1956, distributed as follows: College, 448, normal, 367, academy, 414, Foundation junior high school, 611, training school, 116. The enrollment in the summer session of 1929 was 495, of whom 223 were in the college, 146, in the normal school, and 126, in the academy. The faculty numbered 106, distributed as follows: College, 31, normal, 12, academy, 22, Foundation junior high school, 28, training school, 5, music, 8. The endowment amounted to \$8,894,739, and the income for the year ending June, 1929, was \$357,223. The library contained 57,994 volumes. President, William J. Hutchins, D.D., LL.D.

**BERGER, VICTOR L.** American editor and first Socialist elected to the United States Congress, died in Milwaukee, Wis., Aug. 7, 1929. Born in Nieder Reibach, Austria-Hungary, Feb. 28, 1860, he attended the universities of Budapest and Vienna, and in 1876 moved to the United States with his parents. After working at various odd jobs in New York and Wisconsin, he became a public school teacher in Milwaukee. Berger was converted to Socialism, and was a pioneer in organizing the Socialist party in the United States, serving on the National Executive Board of the Socialist party from its organization in 1898 until 1923. In 1892 he resigned from school work and undertook the editorship of the Milwaukee *Daily Worker*, an outgrowth of the old German Socialist paper, *Die Volkszeitung*. He later filled a similar position on the *Wahrheit*, and in 1900 transferred to the *Social Democratic Herald*. He became the editor of the Milwaukee *Leader* in 1911, and made it a factor in the development of the Socialist party, remaining with that paper until his death. Berger had been a delegate to the People's Party Convention in St. Louis in 1890, where he attempted to unite the followers of Eugene Debs. After being defeated as the Social Democratic candidate for Mayor of Milwaukee for Congress in 1904, he was elected alderman-at-large in 1910. The following year, he took his place as the first Socialist in the United States House of Representatives, sitting for the fifth Wisconsin district until 1913. Because of Socialist principles, Berger was outspoken in his opposition to the entry of the United States in the World War. In December 1918, he was brought to trial for violation of the Espionage Act and on Jan. 8, 1919, was sentenced to 20 years imprisonment. In November, 1918, he had been reelected to Congress, but was excluded from membership, Nov. 10, 1919, by a vote of 309 to 1, on the ground of disloyalty to the United States; he was again returned, with an increased majority, in 1919, and again excluded. In the meantime, he had carried the espionage conviction to the Supreme Court, and in 1921 that body reversed the decision of the lower court, and the Federal Government withdrew all other indictments against him. He was elected to Congress once more, with an even greater majority, in 1922, and seated, the only Socialist in the

House, without a dissenting vote. He again served in Congress, 1925-29, and was chairman of the national executive committee of the American Socialist party, from October, 1927, until his death.

**BERIBERI.** The disease which has long been known as the first of a number dependent on vitamin deficiency seemed in danger of being thrown from its pedestal. For although it was still quite true that a diet of polished rice was a most prominent causal factor, the actual cause of beriberi has been held to be a microorganism as a result of a research by a board of 13 Japanese scientists, whose report appears in the *Journal of the American Medical Association* for April 20. Until recently, no one doubted that beriberi was due solely to lack in the diet of vitamin B, but after reading the report in question, it is evident not only that the problem is by no means so simple, but that some doubt has been thrown on the entire problem of deficiency diseases. Various data which have slowly accumulated during a term of years have been assembled by the investigators, and the polished-rice theory is seen to be quite unequal to meeting all conditions involved. Thus, it has been shown that a single case of the disease, originating say on board a ship, the diffusion to others cannot be explained by any suppositions in regard to diet. There is a distinct evidence of spread from man to man, as if by contagion. Again in fowl beriberi, only about half those fed on polished rice actually contract the disease. The germ does enter the body with the food and a polished rice diet must lower resistance to it. The beriberi bacillus has been isolated and beriberi patients give a positive agglutination test.

**BERKELEY,** BISHOP GEORGE, ANNIVERSARY. See CELEBRATIONS.

**BERLINER,** EMILE German-American inventor, died in Washington D. C. on Aug 3, 1929. He was born in Hildesheim, Germany, May 20, 1851, educated at Wolfenbuttel, and emigrated to America in 1870. Though without scientific training, he became keenly interested in electricity and acoustics. He invented the gramophone in 1877 and also invented and perfected the method of duplicating disc records. In 1908 in aeronautical experiments, he first used the light-weight revolving-cylinder combustion motor, employed on airplanes. Under his direction, his son Henry designed and used the first successful helicopter in 1919. Mr. Berliner also was actively interested in the prevention of sickness, and in 1901 conducted a campaign against the dangers of raw milk and other dairy products, and planned the Washington Milk Conference of 1907.

**BERMUDA.** A British colony in the West Indies consisting of a group of small islands lying about 580 miles from Cape Hatteras, N. C. About 20 of the islands are inhabited. Because of its picturesqueness and proximity to New York (677 miles), it is a favorite winter resort for American tourists, who number some 30,000 annually. Area, 19.3 square miles, population, according to the census of 1921, 20,127 (7000 white). The chief town, Hamilton (population 3000) is an important naval base. The estimated civil population in 1927 was 30,814 (15,833 white). Statistics for commerce and finance are given in the next column.

In 1927 the total tonnage of vessels entered and cleared was 3,041,350 tons of which 2,466,895 were British. The public debt in 1927 was

## BERMUDA—COMMERCE AND FINANCE

	1926 £	1927 £
Imports	1,404,824	1,532,794
Exports	236,563	249,058
Revenue	814,298	290,236
Expenditure	291,209	249,420

£70,000. The chief products are potatoes, onions, lily bulbs, and various vegetables. The chief imports in 1927 were provisions, beef, bran, clothing, cotton goods, electrical goods, flour, hardware, fuel oil, and woolen goods. The chief exports are potatoes, onions, other vegetables, bulbs, and whisky. A new tariff, effective from Jan. 1 to Dec. 31, 1929, increased the customs surtax levied on goods not produced in the British Empire from 10 to 25 per cent of the import duty. Other changes raised the import duties on fuel oil, fresh vegetables, cream, and pork. The administration is under a governor assisted by an executive council of seven members and a legislative council of nine members appointed by the King and an elected Assembly of 36 members. Governor in 1929, Lieut-Gen Sir Louis Jean Bols.

**BERRIES.** See HORTICULTURE.

**BERRY,** REAR ADMIRAL ROBERT MALLORY American naval officer and explorer, died in Tynon, N. C., May 19, 1929. Born in Henry County, Ky., Jan. 28, 1846, he was graduated from the U. S. Naval Academy in 1866. After serving with the Union Navy through the Civil War, 1864-68, he was stationed on various ships, going to the Arctic as watch officer of the *Tyress*, 1873. In 1881 Berry was commissioned commander of the U. S. S. *Rodgers*, to search for the *Jeannette*, which had been wrecked in the Arctic during the De Long expedition. On his return, he again received various commissions, commanding the *Castine*, 1896-99, throughout the Spanish-American War. He retired with the rank of rear admiral on Jan. 28, 1908, but returned to service during the World War, as commander of the U. S. Naval Unit at the University of Michigan, from Sept. 23, 1918, to Jan. 3, 1919.

**BERYLLIUM.** See METALLURGY.

**BES'SARABIA.** Formerly a government of the Russian Empire, joined to Rumania in March, 1918. See RUMANIA.

**BIBLE SOCIETY, AMERICAN.** This society, founded in 1816, has the definite and sole purpose of "circulating the Holy Scriptures without note or comment," without denominational or racial discrimination, and both throughout the United States and in foreign lands its Bibles, Testaments, and Portions are priced without purpose of profit. They are distributed through 10 home agencies, covering the United States, and 12 foreign agencies, covering all Latin America and countries in the Near East and the Far East.

In 1928 the society issued 11,032,494 volumes of Scripture, of which 4,547,868 were distributed in the United States and 6,484,626, in foreign lands. The Scriptures were issued in 182 languages, including editions in Roman and Gothic characters in some languages and embossed systems for the blind. During its 113 years of service, the society has issued 205,096,251 volumes. There were 1076 workers participating in this service in the United States, of whom 628 were volunteers, and 3087 workers in foreign lands, of whom 1175 were volunteers.

During the year 1929, the society published new translations in several languages. The *Four*

*Gospels* were published for the first time in the languages of the Hopi Indians and of the Eskimos of the district of the Kuskokwim River and Bristol Bay in Alaska. Publication of *Acts* in Cheyenne was in process. In Central America, a translation of the *New Testament* into Cakchiquel was completed, and work was progressing on translations into Quiche and Mam in South America, the *Psalms* were translated into the language of the Bolivian Quechuas and the *Gospel According to Mark* was published in Aymara. The modern version of the Spanish Bible was reissued with corrections. The increasing Japanese population of Brazil made it advisable to issue a Japanese-Portuguese edition of the Scriptures. For distribution in Africa, the society issued revised editions of the *Four Gospels* and *Acts* in Beiga and the *New Testament* in Tswa, while new translations were published of the *New Testament* in Luragoli, of the *Gospel According to Matthew* in Shilluk, and of *1 Corinthians* through Jude (with the exception of *Hebrews*) in Olunvoro. Advantage was taken of the recent Turkish law, substituting Roman for Arabic characters, to correct the Turkish version of the Bible at the same time as the transliteration was made. In the Far East, work progressed on improved translation of the Scriptures in Siamese and in the Ilocano Tagalog, and Samaritan languages of the Philippines.

The total receipts of the society for the year from invested funds, gifts, sale of books, etc., amounted to \$1,077,097, while its expenses totaled \$1,075,849. The society continued to have the cooperation of about 100 auxiliary Bible societies throughout the United States, which assisted in the circulation of the Scriptures in their own localities and contributed to its work elsewhere. The officers in 1929 were E. Francis Hyde, president, the Rev. Eric M. North and the Rev. George William Brown, general secretaries, the Rev. Lewis B. Chamberlain, recording secretary, and Gilbert Darlington, treasurer. The official organ of the society is the *Bible Society Record*. Headquarters are at the Bible House, Astor Place, New York City.

**BIBLIOGRAPHY.** See PHITTOLOGY. MODERN **BICKERTON, ALEXANDER WILLIAM** English astronomer, died Jan. 23, 1920, in London. He was born Jan. 7, 1842, in Alton, Hampshire, and was educated in the grammar schools there and at the Royal School of Mines and the Royal College of Chemistry in London. In 1874 he became professor at the New Zealand University, where he taught chemistry and was also analyst for the New Zealand government. While teaching in New Zealand, he became interested in astronomy and in 1878 formulated his astronomical theory of partial impact. This theory explained the appearance of new and temporary stars as being caused by the collision of comical masses, during which new bodies were formed of the detached material. His advocacy of this theory, for which he could offer no substantial proof, brought him into disfavor with the board of governors of New Zealand University. In 1902 he resigned and gave all his time to scientific research. In 1910, with the assistance of a fund started by Lord Dudley, Governor-General of Australia, he went to live in London, hoping to obtain wider acceptance of his astronomy of cosmic impact. Though he was never able to prove his astronomical theory, his work excited a great deal of scientific interest in London and he organized the London Astronomi-

cal Society. He was the originator of London Popular Technical Classes, an organizer of science in Hartley Institution, and a lecturer at Winchester College, the Royal Colonial Institute, and the Royal Institution. He was a fellow in a number of scientific societies, among them the Chemical Society and the Institute of Chemistry, and he received two international gold medals for new scientific apparatus. His published works include *New Story of the Stars*, *Romance of the Earth*, *Romance of the Heavens*; *Atoms, Suns, and Systems*, *Birth of Worlds and Systems*, *Perils of a Pioneer*.

**BICYCLING.** See CYCLING. **BIGHAM, JOHN CHARLES**, FIRST VISCOUNT OF MERSEY. English lawyer and judge, died Sept. 3, 1920, in Sussex, England. He was born Aug. 3, 1840, and was educated at the Liverpool Institute and in Berlin and Paris. He was called to the bar (1870), was Queen's Counsel (1883), and became Benchler of the Middle Temple (1886). He was a Unionist member of Parliament for the Exchange Division of Liverpool (1895-97), and a member of the South Africa committee of the House of Commons in 1896-97. From 1897 to 1909, he was judge of the King's Bench Division of the High Court of Justice, and in 1909-10, as president of the Probate, Divorce, and Admiralty Division, won commendation for bringing stability to English divorce laws. Upon retirement from the bench in 1910, he was made a peer. Lord Mersey was a member of the Royal Commission for the Revision of Martial Sentences in South Africa in 1902, president of the Railway and Canal Commission (1904-09), and a commissioner inquiring into the wreck of the *Titanic* (1912) and of the *Lusitania* (1915). In 1913-14 he was president of the International Conference on Safety of Life at Sea.

**BILLIARDS.** Ralph Greenleaf's world's-record run of 126 which was a part of his campaign which regained the world's title at pocket billiards was the high spot in the 1929 billiard performances. Greenleaf scratched in the first inning and then ran 126 to defeat Frank Taberski, 1928 titleholder, in the final match of the tourney held in December at Detroit. Young Jake Schaefer was another former champion to regain his laurels, winning the 182 balkline title at the Level Club in New York and supplanting Edouard Horemans, of Belgium, as champion Johnny Layton of Sedalia, Mo. was a holdover champion at three-cushion billiards, not being called upon to defend his title in 1929.

Percy Collins of Chicago won the national amateur 182 title in tournament play only to lose it in a challenge match with Ray Fessenden of Madison, Wis. Fessenden in turn lost a challenge match to M. C. Wallgren of Edmonds, Wash., who retained the title. The world 181 amateur Class A title was taken by Edouard Soussa of Egypt in an international tournament which was held at the Crescent Athletic Club in Brooklyn, N. Y.

Charles E. Jordan of Los Angeles forfeited his national amateur three-cushion crown when he turned professional. His title was captured by Max Shimon of Milwaukee. Other amateur titleholders in the balkline class were Seymour Kling in Class B, Claude Lewis in Class C, and Harry Tatar in 142 balkline. Cy Yellon of Jersey City won the national amateur pocket-billiard championship, while Frank Gray won the national straight-rail title.

**BIRMINGHAM-SOUTHERN COLLEGE.** A coneducational institution for higher learning in Birmingham, Ala., founded in 1859. The enrollment for the autumn of 1929 was 879, of whom 470 were men and 409, women. The enrollment for the 1929 summer session was 802—309 men and 493 women. There were 63 faculty members. The endowment amounted to \$750,000, and the income for the year was \$312,500. There were 25,000 volumes in the library. President, Guy Everett Snavey, Ph.D., LL.D.

**BIRTH RATE.** See CHILD WELFARE, VITAL STATISTICS.

**BLAKESLEY, THOMAS NORMAN.** An English physicist and archaeologist, died Feb. 15, 1929, in London. He was born in 1847, and was educated at King's College, Cambridge University. Although he was a civil engineer, he was much better known for important contributions to various fields of theoretical science. In 1875 he gave to the Royal Asiatic Society an account of the ruins by Sigiiri in Ceylon. He discovered a mass of meteoric iron by the local effect on the magnetic declination; he experimented and developed optical instruments, constructing new forms of lenses and spectroscopes; he invented a portable mercurial barometer and mechanical methods of solving cubic equations and related problems, and he showed the connection of logarithmic curves with the curves of Spanish-Arabian architecture. In the field of electricity, he experimented with alternating currents and problems in telegraph cables and electrical power transmission. He wrote widely on scientific subjects, his work being published chiefly in the *Proceedings of the Physical Society of London* and in the *Philosophical Magazine*. He wrote *Alternating Currents of Electricity* (1899), *Geometrical Optics* (1903).

**BODE, WILHELM VON.** German art critic, died in Berlin, Mar. 1, 1929. Born in Galvorde, Brunswick, Dec. 10, 1845, he studied law, but gave up that profession to study art and archaeology at Berlin and Vienna. Having become associated with the Berlin Museum in 1872, he was made director of the Department of Christian Sculpture in 1883, and of the Gallery of Paintings in 1890. Under Dr. von Bode's management, the museum developed into one of the foremost collections in the world. He was given the general direction of all the Royal Museums in Prussia in 1905, and four years later made privy councillor. Dr. von Bode was familiar with every branch of art since the Middle Ages, but his most profound study was in Dutch and Flemish paintings, and Italian and German sculptures. He belonged to the academies of Berlin, Munich, and Amsterdam and, among other decorations, he received the Prussian Order of the Red Eagle; hereditary nobility was conferred upon him in 1914. Dr. von Bode retired in 1920, only retaining his directorship of the Kaiser-Friedrich Museum. His many books include *Geschichte der deutschen Plastik* (1887); *Rembrandt, with Hofstede de Groot* (1897-1905); *Florentiner Bildhauer der Renaissance* (1902); *Die Meister der holland und vldmen Malerschulen* (1917); *Boticelli* (1922);

*Fünfzig Jahre Museumsarbeit* (1922); and *Adriaen Brouwer* (1924).

**BODENBINDERITE.** See CHEMISTRY, under *Mineralogical Chemistry*.

**BOHEMIA.** A constituent member of the State of Czechoslovakia since the defeat of the Central Powers in 1918; formerly a crownland of Austria, situated in the northwestern part of the former Austro-Hungarian Empire, with Saxony and Silesia to the north, Moravia on the east, and Lower and Upper Austria on the south. Area, including the small Austrian and German territories which were added by the peace treaty to Czechoslovakia, 20,102 square miles; population, Feb. 15, 1921, 6,670,582, estimated population, Jan. 1, 1927, 6,922,600, or 344.3 persons to the square mile. Bohemia is represented in the Czechoslovak Legislature by nine Deputies and five Senators. See CZECHOSLOVAKIA.

**BOILERS, STEAM.** Few radical changes in boiler design, were witnessed during the year 1929, although there were many improvements in detail, and the trend toward still larger units and wider application of high steam pressures continued. The number of 1200-1400-pound central stations practically doubled, the Ford Motor Company announced a 1400-pound addition to its plant in Detroit in which each of the boilers were to be designed to produce 700,000 pounds of steam per hour—the largest boilers yet attempted for this pressure. The 1800 pound Philip Carey installation at Lockland, Ohio, previously announced, was nearing completion, and tentative plans were being considered for the first boiler plant in the United States to operate at or near the critical pressure of 3200 pounds. Two boilers already had been placed in service at this pressure in Germany and another was under construction in Belgium.

A record in boiler output was attained toward the close of the year when one of the new boiler units at the East River Station of the New York Edison Company turned out 1,250,000 pounds of steam per hour at 400 pounds pressure. This was five times the maximum capacity of any boiler operating ten years ago. The ever-increasing size of both boilers and turbines was pointing toward the supply of a single large turbine with steam from a single boiler. This point was reached in one plant, the Gould Street Station in Baltimore.

In the United States, the general design of high-pressure boilers has followed that of medium pressure, with the exception of forged drums and heavier parts. This is in contrast to European practice where high pressures have involved special designs, however, European high-pressure boilers are of much less capacity than those found in the United States.

There were no recent changes in practice as relates to steam temperatures, although higher temperatures were viewed favorably as a means of increasing the efficiency of the steam cycle. With one or two exceptions in American stations, power-plant practice has held to a maximum of about 750 degrees. This has been due to uncertainty as to the behavior of materials in service under a combination of high pressure and high temperature. The 1000-degree boiler and turbine unit that was ordered in 1929, as an experimental installation at the Delray Station in Detroit was not yet in operation.

The practice of forcing boilers to high rates of steaming in vogue has brought water-cooled furnace walls into general use. Also the resulting

high temperatures of the products of combustion have made it necessary to provide more heat-absorbing surface, in the form of economizers or air preheaters, in order that the gases entering the stack will not carry away too much heat. As economizer and air preheater surfaces are less expensive, with high-pressure boilers, than boiler heating surface, later boiler units embody a larger proportion of the former. While the efficiency of the boiler proper had not increased materially over that of ten or fifteen years previously, that of the combined unit, including water-walls, boiler, economizer, air preheater, and superheater, was appreciably higher. Efficiencies exceeding 90 per cent have been obtained with such units on test, and 85 per cent under normal operations was not uncommon.

A recent development was the application of forced circulation to small-tube water walls in which exceedingly high rates of heat transfer were obtained.

In the firing of boilers, pulverized coal and mechanical stokers were strong competitors, with pulverized coal somewhat in the lead for large units and stokers holding their own with smaller units. Oil and gas firing were extensively employed in certain localities where such fuel was abundant and relatively cheap. For heating boilers, the oil burner and small mechanical stoker were close competitors.

Renewed interest in smoke prevention was being taken by many cities and resulted in closer attention being given to boiler settings and to firing. With pulverized coal, about two-thirds of the ash in the coal is carried up the stack in very finely divided particles. This does not appear to create a nuisance in the immediate vicinity of the plant because of the fineness of the ash which is diffused by the wind and spread over a wide area. Nevertheless the ash is in the air and must come down. Stoker cinders, being larger in size, are more likely to be deposited in the vicinity of the plant. Many devices were on the market for arresting this ash dust and cinders before reaching the stack. Some were fairly satisfactory but the whole subject was still in a development stage.

The slagging type of furnace for collecting and disposing of the powdered coal ash that falls to the bottom of the furnace was gaining in favor among larger plants that employ coal having ash of relatively low-fusing temperature.

**BOKHARA**, Bokhara State in central Asia, formerly a dependency of the Russian Empire, later known as the Bokharan People's Republic, and since May, 1925, a part of the Soviet Socialist Republic of Uzbek. It is bounded on the north by the Kazan Soviet Socialist Republic and the autonomous regions of Kara Kalpak and Kirghizia, on the south by Afghanistan and the Tadzhik Soviet Republic, on the east by the Tadzhik Republic and Ferghana, and on the west by Turkmenistan, Samarkand and Syrdaria. The Uzbeks, who form the majority of the population, ruled Central Asia until the arrival of the Russians. Estimated area, 79,000 square miles, estimated population, 3,000,000. The chief towns with their estimated populations are Bokhara 75,000, and Kashg, 25,000. The religion is chiefly Mohammedan. The chief products of Bokhara are corn, fruit, silk, tobacco, cotton, hemp, and fur animals, and the chief minerals are gold, salt alum, and sulphur. The trade is mainly with India, to which raw silk is exported and

from which tea, indigo, Dacca muslin, etc., are imported. By the revolution of Aug. 30, 1920, the Amir was dethroned and the Soviet government was set up, which formed a military and political agreement with Russia. In the autumn of 1924, congresses of the three Soviet republics of Turkestan, Khiva, and Bokhara decided to redistribute their territories on a national basis. Parts of Russian Turkestan, the states of Khiva and Bokhara, and the Trans-Caspian Province were united to form the two Socialist Soviet Republics of Uzbekistan and Turkmenistan, Bokhara being incorporated in Uzbekistan. Both republics were admitted to membership in the Union of Socialist Soviet Republics in May, 1925.

**BOLIVIA**, A South American republic situated in the interior and bounded by Brazil and Paraguay on the east, by Argentina on the south, by Chile and Peru on the west, and by Brazil on the north. Sucre is the seat of the supreme court and is historically regarded as the capital, but the actual seat of the Government and the largest city is La Paz.

**AREA AND POPULATION** Estimated figures for 1927 place the area at 514,155 square miles and the population at 2,974,804, including 1,624,111 Indians, 496,642 whites, and 858,152 of mixed race. The census of 1910 showed a population of 1,766,451. In 1927 the estimated population of La Paz was 142,043 (54,713 by census of 1910). Other large towns with their estimated populations were Cochabamba 43,643, Potosi, 33,723, Sucre, 30,200, Oruro, 39,618, and Santa Cruz, 23,515.

**EDUCATION** Elementary education is free and compulsory and is under the care of the municipalities and the state. In 1927 there were 70,228 pupils in public elementary schools, 15,619 pupils in private schools of various grades, and 5082 students in secondary and superior schools. The eight institutions offering university instruction have 107 teachers and 802 students. At Sucre and La Paz are the only two universities which possess more than one faculty. There are also a number of training colleges for teachers.

**PRODUCTION AND COMMERCE** The enormous preponderance of the mining industry is the chief feature of economic life, while the inadequacy of the transportation system, owing to the great geographical and topographical difficulties which beset road building in the Republic is a serious handicap to development. Mineral exports, consisting chiefly of tin, have constituted over 90 per cent of Bolivia's total exports since 1920. The tin industry is comparatively recent, and was established during the last century. The price of tin is the barometer of Bolivian prosperity, notwithstanding the fact that other minerals, notably silver, gold, lead, bismuth, zinc, antimony, tungsten, and nickel are also produced. Bolivia is the chief source of antimony outside of China. The production of lead has shown a considerable increase owing to the greater demands for this metal in the automobile, radio, and cable industries.

Agriculture is relatively unimportant and although about 4,940,000 acres are under cultivation, the cultivation methods have improved but little since primitive times. Irrigation by means of ancient wells is attempted in some places. Potatoes, cacao, coffee, barley, highland rice, and rubber are the principal products, Colombia ranking next to Brazil as the chief rubber-exporting country of South America. The demand, how-

ever, has fallen with increasing development of the East Indian product. The livestock of the country in 1927 was estimated at 1,404,315 cattle, 4,150,560 sheep, 415,781 goats, 700,000 llamas and alpacas, 1,168,330 donkeys, 267,680 swine, and 320,000 horses. Oil is found in various parts of the republic but is undeveloped. Forest resources are abundant but the lack of transportation facilities and the fact that the natural river systems flow away from the Pacific coast prevent any marked exploitation. Coal is too costly for general use, native fuels are poor and the vast potential hydroelectric resources lie undeveloped. This lack of fuel has been a sharp deterrent to the establishment of various industries, notably smelters and refineries.

In general, Bolivia experienced a continuous business depression since the middle of 1927, with the exception of a brief period early in 1929. The downward trend of the prices of tin, which since 1920 had constituted 90 per cent of the total exports, was immediately reflected in the commercial and economic condition of the country. Toward the end of 1929, the continued low price of the metal led to a critical situation, with business of all kinds seriously curtailed. On November 13, the mine owners petitioned the Government to allow a 30 per cent reduction in wages and a 50 per cent reduction in freight rates while the price of tin remained below \$220 per ton. In recent years, the government has been endeavoring to foster manufacturing industries by heavy protective duties. A cotton mill opened in La Paz early in 1929 was expected to stimulate the growing of cotton, an American-owned cement plant began production at Viacha in February, 1928, and in March, 1929, the government awarded a highly favorable concession to a company formed to establish a sugar industry.

The purchasing power of the country is extremely limited, the population, predominantly Indian and Mestizo, has a small earning capacity. The Indians buy few imported goods. It is estimated that not over 10,000 families have incomes exceeding \$1800 a year and that fewer than 100 families have incomes exceeding \$15,000.

In 1928 Bolivia had a total foreign trade of 178,605,908 bolivianos, as compared with a total of 193,188,600 bolivianos in 1927, a decrease of 7.55 per cent (1 boliviano has a par value of \$0.39).

Imports for 1928 totaled 62,699,055 bolivianos, as compared with 66,104,673 in 1927, a decrease of 5.15 per cent, while exports amounted to 115,906,853 bolivianos, as compared with 127,083,927 in 1927, a decrease of 8.8 per cent. A large favorable balance of trade had characterized Bolivian foreign commerce for many years. The bulk of the imports in 1928 were manufactures, valued at 44,324,384 bolivianos. Other imports were food products and beverages, 8,890,770 bolivianos, raw and slightly wrought materials, 7,249,733 bolivianos, live animals, 2,234,168 bolivianos. Imports of the principal classes of textiles were valued at \$7,004,000 in 1927 and \$5,580,000 in 1928.

Of the total exports in 1928, minerals represented 108,029,873 bolivianos, or 93.2 per cent. The leading mineral exports for the year were tin, 89,710,122 bolivianos; copper, 5,205,696 bolivianos, lead, 2,820,483 bolivianos, silver, 6,875,720 bolivianos, and zinc, antimony, bismuth, wolframite, and gold in lesser amounts. Leading non-mineral exports in 1928 and their

respective values, were rubber, 3,451,365 bolivianos; live animals, 3,070,777 bolivianos; hides, 1,548,259 bolivianos, cacao, 1,002,640 bolivianos. Other exports were alpaca, sheep, and llama wool, dried fruit, leather goods, and quinine. Exports to the United States declined considerably in 1927 and 1928, due chiefly to a depression in the mining industry. Of the total mineral exports in 1928, 79.6 per cent went to Great Britain and only 8.4 per cent to the United States. In 1929 both imports from the United States and exports to that country showed a slight increase over 1928.

**FINANCE.** The budget for 1929, issued by President Siles after Congress had failed to act within the required time, balanced at 94,950,619 bolivianos. Ordinary receipts (in bolivianos) included those from national services, 2,514,403; direct and indirect taxes, 41,055,938; other sources, 3,007,997. Special receipts of departmental and municipal obligations were estimated at 3,763,945 bolivianos and receipts of the departments at 41,511,102 bolivianos. Ordinary expenditures (in bolivianos) included judiciary, 2,000,000; interior, 2,512,356; communications, 2,270,388; education, 4,380,276; war, 9,620,000; national collections, 2,220,000; service of the direct public debt, 18,258,637. There was also included as special expenditures for the service of the indirect public debt, 3,763,945 bolivianos, and as departmental expenditures, 44,511,102.

A new Central Bank, the Bolivian National Bank, was created July 1 in accordance with the recommendations of Professor E. W. Kemmerer, former financial adviser to Bolivia, with Alberto Palacios, former Secretary of the Treasury, as manager. It was hoped that the new bank would stabilize the national currency.

The Fiscal Permanent Commission reported in October, 1929, that the public debt totaled \$63,885,128, of which \$61,904,000 represented the external debt, \$52,544 the internal debt, and \$1,828,584 the floating debt. The per-capita debt was \$24.64.

Under a contract signed between the Minister of the Treasury and E. O. Detlefsen, a banking expert of New York, in December, 1928, Mr. Detlefsen agreed to act as superintendent general of the banks of Bolivia for a period of at least three years.

**COMMUNICATIONS.** Bolivia in 1929 was making determined efforts to remedy the lack of transportation facilities which had hindered the economic development of the country. The total length of railway in operation in 1927 was 1302 miles. An extension of the Oruro-Cochabamba line to Santa Cruz, a distance of 225 miles, was nearing completion in 1929. In the same year, Congress approved a new internal loan of 2,000,000 bolivianos for the construction of a railroad from Cliza to Aquila and 1,300,000 bolivianos for the completion of the Potosi-Sucre railroad. A decree of the Republic was issued in April 3, 1929, and a local firm was granted a concession to establish and operate aerial railways between Hichuloma and the Provinces of North and South Yungas for 25 years.

The main highways, totaling 1125 miles in 1927, were being considerably extended in 1929. In addition, there were 6843 miles of cart roads connecting the important towns. There were about 4608 miles of telegraph, and 3589 miles of

the continuity of her territory" as established in the treaty with Peru.

President Siles and other government officials publicly declared that the Tacna-Arica settlement, as it stood, was not acceptable to Bolivia. For terms of the settlement, see under CHILE and PERU.

The first Congress of Bolivian Women, which adjourned May 4, reflected the national sentiment in adopting a resolution supporting the Government's demand for an outlet to the Pacific. The congress also asked equal civil rights for men and women. The second lynching in the history of the country occurred during the year, when Saturnino Balderrama, who assassinated Dr Luis Faraoz during the heat of an electoral campaign, was hanged by a mob.

The T. J. J. Dramatic Company was organized during the year in connection with the movement for a national theatre. It proposed to present the Creole and indigenous drama and folklore of Bolivia throughout the principal capitals of the continent and to stimulate the development of a native drama. See ARBITRATION, INTERNATIONAL, also PARAGUAY, under History.

**BOLL WEEVIL**, BOLLWORM. See COTTON, ENTOMOLOGY, ECONOMIC.

**BOLTON**, BENJAMIN MFADE. American bacteriologist, died in New York, Aug. 12, 1929. He was born in Richmond, Va., and received the M.D. degree from the University of Virginia in 1879. He also studied at South Carolina College, 1882-83, and at the universities of Heidelberg, Göttingen, and Berlin. He taught bacteriology and pathology at The Johns Hopkins University, South Carolina College, University of Missouri, and University of St. Louis. Dr. Bolton was an expert on the diseases of animals being connected with the Cuban Agricultural Experiment Station, 1914-15, and with the Bureau of Animal Industry at Washington, D. C. After 1921 he was pathologist at St. Joseph's Hospital, Paterson, N. J.

**BOND**, EDWARD AUSTIN. An American engineer, died Dec. 10, 1929, in New York City. He was born in 1849 in Dexter, Mich. He began his work as an engineer in 1868 in New York State with the Utica, Chenango & Susquehanna Railroad. In 1898 he became State engineer and surveyor, holding the position until 1904. During his term of office, he had charge of the surveys and plans for the construction of the New York Barge Canal. He also undertook with the aid of the Federal government, a system of stream measurement with the object of flood prevention in view. After 1904 Mr. Bond was a consulting engineer in general practice. In 1914 he visited Uruguay in the interest of a harbor improvement. He was also president of the water-works companies at Barrie, Chatham, and Napenée, Ont., and consultant to important banking organizations on various engineering problems.

**BOOK CLUBS**. See LITERATURE, ENGLISH AND AMERICAN.

**BOOTH, GENERAL (WILLIAM) BRAMWELL**. British Salvation Army leader, died in Hadlev, near London, on June 16, 1929. He was born at Halifax, Nova Scotia, Mar. 8, 1856, the eldest son of General William Booth, founder of the Salvation Army. The elder Booth was a crusader and evangelist, while Bramwell Booth, in his position as chief of staff from 1880 to 1912, was an executive. In 1912 he succeeded his father as

head of the Salvation Army. As leader, Gen. Bramwell Booth changed his policies to conform with the times, with the result that the influence of the organization steadily increased. Especially during the years of the World War, the position of the Salvation Army grew in importance. On his seventieth birthday, Booth received gifts from 24 nations for furthering his work, and in 1928 he was appointed by the King a member of the Order of Companions of Honor. Autocratic methods, however, brought General Booth into conflict with his associates. In 1922 he ordered the removal of his sister, Miss Evangeline Booth, commander of the Salvation Army in the United States, in order to appoint American commissioners who would be under direct jurisdiction of the English headquarters. Though the order was never carried out because of protests raised, friendly relations were not reestablished between brother and sister until 1926. Because of his increasing feebleness and on account of dissatisfaction with his autocratic methods, there arose within the organization a movement to depose General Booth. In January, 1929, the High Council of the Salvation Army, by a vote of 55 to 8, ordered his removal because of physical disability. General Booth, refusing to resign, appealed to the courts and won the nullification of the vote on the grounds of his having lacked a representative at the meeting of the council, but the movement to depose him went on. After a full hearing had been given his representative, another vote was taken, Feb. 13, 1929, which was 52 to 5 in favor of removing General Booth and appointing Edward J. Higgins, chief of staff, in his place, a choice meeting with wide approval. General Booth died four months later, and all over the world was mourned and honored as a great leader. He was the author of *Books that Bless, Our Master, Servants of All, Social Repatriation, On the Banks of the River, Bible Battle Axes, Life and Religion, Echoes and Memories, General Booth's Journal*. See SALVATION ARMY.

**BOOTH-TUCKER**, FREDERICK ST. GEORGE DE LAUTOUR. English commissioner in the Salvation Army, died in Stoke Newington near London, July 17, 1929. He was born at Monghyr, Bengal, India, on Mar. 21, 1853, was graduated from Cheltenham College in England and in 1876 became a member of the Indian Civil Service at Punjab. He resigned in 1871 to join the Salvation Army, and soon entered upon organization work in India. With three helpers, he adopted the costume of religious mendicants, begging and preaching in the public streets. These spectacular methods brought upon them the disfavor of Indian officials, and they were even imprisoned for a month. This method of reaching the poor, however, was so successful that in 1913 he was awarded the Indian Gold Medal, Kaiser-i-Hind, given for meritorious public service. In 1888 he married Emma Ross Booth, daughter of William Booth, founder of the Salvation Army, and changed his name from Tucker to the hyphenated form, Booth-Tucker. He was appointed foreign secretary at Salvation Army headquarters in London in 1891, where he remained until 1896, when he was sent to America as commander of the Salvation Army there. He served again in England from 1904 to 1907, and then returned to India, where he remained until 1919. During those years, he was engaged in the social uplift side of the organization, inaugurat-

ing silk and weaving schools, agricultural settlements, and reformatory work among the Indian criminal tribes. He returned to England in 1919, where he remained until his retirement in 1927. He often came into conflict with his brother-in-law, and was active in calling the meeting of the council which deposed General Booth in 1920. Commissioner Booth-Tucker was the author of several works important in Salvation Army history. He wrote *The Life of Catherine Booth* (1892), *Mukhtaufai, or Forty Years with the Salvation Army in India* (1923); *Jesus at His Home in Nazareth* (1900).

#### BOOTLEGGING. See PROHIBITION

**BOOTS AND SHOES.** During the year, this industry was vitally interested in new tariff legislation discussed in Congress. The Hawley Tariff Bill as passed by the House of Representatives on May 28, placed a tariff of 20 per cent on boots and shoes imported, while the tariff put on hides was 10 per cent. This rate of duty, however, did not meet with the approval of the Senate, and by it boots and shoes, as well as hides and leather, were restored to the free list. The duty was demanded because imports of leather footwear, which were free of duty, had increased rapidly, especially from Czechoslovakia, a country that in 1928 supplied over two-fifths of the total imports in terms of value. The United Kingdom, France, Switzerland, Austria, Canada, and Germany, named in the order of rank in value of imports, were the other sources of supply. The major portion of the imports were women's shoes, which in 1928 represented 77 per cent of the total number and 71 per cent of the total value. Imports for 1929 are given below.

The total production of boots and shoes, other than rubber, as reported by the U. S. Department of Commerce for the year 1929, was 361,402,183 pairs. This represented an increase of 5 per cent over the production for 1928, namely, 344,350,724 pairs, and was to be compared with 343,605,905 pairs for 1927. The output of men's leather boots and shoes increased 42 per cent, of women's, 61 per cent, of misses' and children's, 75 per cent, of athletic and sporting shoes (principally men's) 42 per cent, and of slippers for house wear, 137 per cent. There was a decrease of 0.2 per cent in boys' and youths' shoes, of 0.4 per cent in infants' footwear, of 17 per cent in satin, canvas and other fabric uppers (principally women's) of 18.9 per cent in moccasins (partly due to changes in classification) and of 6.2 per cent in barefoot sandals, play shoes, and other footwear. Massachusetts led the other States, as usual, in the production of boots and shoes, its total output during the year being 83,539,555 pairs. Next in rank were New York with 76,007,919 pairs, Missouri, with 50,745,213 pairs, Illinois, with 27,870,945 pairs, New Hampshire, with 22,975,832 pairs, Wisconsin, with 19,483,253 pairs, Pennsylvania, with 17,233,118 pairs, Maine, with 16,400,103 pairs, and Ohio, with 15,427,350 pairs. The total output for all other States was 31,719,865 pairs.

In the accompanying table is summarized the production of boots and shoes in the United States, as compared with 1928. The establishments reporting manufactured approximately 95 per cent of the total output of footwear, other than rubber.

In 1929 there was a considerable increase over 1928 of the number of shoes imported into the United States. The imports were as follows: All-leather boots and shoes (free), 6,182,041 pairs

#### BOOT AND SHOE PRODUCTION

Kind	United States Number of pairs	
	1929	1928
Boots and shoes, total	361,402,183	344,350,724
High and low cut (leather), total	312,742,744	298,724,547
Men's	94,770,112	90,969,621
Boys' and youths'	22,992,557	23,071,757
Women's	131,303,209	127,752,953
Misses' and children's	39,926,826	37,135,374
Infants'	23,750,040	21,875,142
Athletic, sporting (leather) *	1,611,920	1,547,064
Satin, canvas, other fabric *	3,121,492	3,760,069
Slippers for house wear, total	35,798,289	31,483,157
All leather	7,875,041	6,825,897
Part leather, felt, etc	27,923,248	24,657,260
Moccasins	1,016,835	1,253,198
Barefoot sandals, play shoes, and all other footwear	7,110,903	7,582,689

\* Excludes footwear with rubber soles

valued at \$17,025,931 in 1929, as compared with 2,616,884 pairs valued at \$8,254,224 in 1928, all-leather slippers (free), 975,522 pairs valued at \$1,432,705 in 1929, as compared with 633,908 pairs valued at \$1,019,435 in 1928, and other footwear (durable), 1,109,990 pairs valued at \$314,280 in 1929, as compared with 1,171,923 pairs valued at \$316,633 in 1928. The total value of 8,358,153 pairs of shoes imported in 1929 was \$18,772,925, as compared with 4,422,805 pairs valued at \$9,590,292 in 1928.

Exports of leather footwear in 1929, although increasing in value, had not materially increased in quantity. This was largely owing to the fact that the trade had not fully recovered from the adverse conditions prevailing in 1927, which were a result of the unsatisfactory financial situation in certain countries, tariff changes, increased local production, and increased foreign competition. The total exports to foreign countries in 1929 amounted to 4,807,212 pairs valued at \$11,047,583 as compared with 4,744,325 pairs valued at \$11,342,656 in 1928.

The exports of men's and boys' shoes in 1929 showed a decrease in value, 1,863,263 pairs valued at \$5,581,107 being exported as compared with 1,870,493 pairs valued at \$5,790,517 in 1928. There was, however, an increase in the value of women's and children's shoes and of athletic shoes, sandals, leggings, and other leather footwear. In 1929, 1,731,805 pairs of women's shoes valued at \$4,703,584 were exported as compared with 1,783,342 pairs valued at \$4,309,877 in 1928, 470,731 pairs of women's slippers valued at \$499,032, as compared with 361,500 pairs valued at \$392,099 in 1928, 686,251 pairs of children's shoes valued at \$763,726, as compared with 606,435 pairs valued at \$750,109 in 1928 and 55,102 pairs of athletic shoes, sandals, leggings, and other leather footwear valued at \$100,134, as compared with 62,555 pairs valued at \$93,964 in 1928. The largest exports of men's and boys' shoes, 431,191 pairs, and of children's shoes, 255,560 pairs, were to Cuba, the largest exports of women's shoes, 399,372 pairs, were to Canada.

**BORNEO.** An island in the Malay Archipelago. See BRITISH NORTH BORNEO, BRUNEI, SARAWAK, and DUTCH EAST INDIES.

**BOSNIA AND HERZEGOVINA**, *bô'stâ-gô-vê-na*. Formerly provinces in the Turkish Empire, now provinces of the newly established State of Yugoslavia. In 1908 control over them was acquired by the Austro-Hungarian Empire. In 1918 after the collapse of this empire, they were turned over to Yugoslavia. Area, 10,708

square miles; population, according to the census of Jan 31, 1921, 1,889,929 See JUGOSLAVIA.

**BOSTON MUSEUM OF FINE ARTS.** See ART MUSEUMS

**BOSTON UNIVERSITY.** A nonsectarian institution of higher education in Boston, Mass., founded in 1869 The enrollment for the autumn term of 1929 was 13,986, distributed as follows College of liberal arts, 797, college of business administration, 4032, college and extension courses, 745; college of practical arts and letters, 812, college of music, 213, school of theology, 274, school of law, 534; school of medicine, 216, school of education, 3277, school of religious education, 293, graduate school, 585. Of the total registration, 11,777 were full-time students working for degrees and 2209 were part-time, special students The 1929 summer-session enrollment was 1750 The faculty numbered 492 in the autumn of 1929, other personnel, 107; and trustees and council members, 64 The productive funds of the university exceeded \$3,886,000 Important gifts for the year approximated \$300,000 These included a duplex club house, valued at \$53,000, at Nickerson Field for the housing of visiting as well as home football teams and to serve as a student social centre, and the Sargent School of Physical Education in Cambridge, Mass., assessed at \$82,900 In the eight libraries of the university there were 150,000 volumes, the liberal arts library alone containing 45,088 volumes In 1929 the school of religious education became a senior college and graduate school, requiring two years of liberal arts training before a student may specialize in the religious education field President, Daniel L Marsh, A M, S T B, Litt D, L H D, LL D

**BOTANY.** It was significant of the modern trend in botanical research that students in all branches of the science were realizing the close interrelation between lines of investigation once regarded as wholly distinct Systematists are beginning to recognize the value of genetics, ecology, and physiology, as well as morphology, in determining relationships. Pathologists find that the study of plant diseases from the economic standpoint is closely associated not only with physiology but with many other sciences. As all botanical investigations contribute ultimately to the promotion of agriculture and horticulture, they may be considered to have a direct bearing upon the welfare of the human race, and it is therefore an encouraging sign that interest in the science, judging from the number of active students in different fields, appears to be increasing from year to year

The eighty-sixth annual meeting of the American Association for the Advancement of Science was held in Des Moines, Iowa, Dec 27-31, 1929 Numerous papers relating to botany were presented at the meetings of Section G, the Botanical Society of America, the American Phytopathological Society, and many other affiliated organizations

An accidental discovery by Prof George W Hendry of the University of California that the sun-dried adobe bricks in many ancient buildings in that State contain chopped-up plants has proved of great interest It has been possible to determine the approximate dates of introduction and sources of many plants from a study of the ages of the buildings in which they occur. There is now definite proof, for example, that wheat was introduced into California dur-

ing the Spanish period, and that barley was cultivated throughout the ascendancy of the Spanish missions. Remains of garden crops, fruits, and fibre plants also have been identified

That plant study aids medical research has been demonstrated by Dr David I Macht of Baltimore, who has found that certain substances having a toxic effect on living animal tissues do not injure living plant tissues, while other substances may have the opposite effect Thus, human blood serum in the skin disease known as pemphigus is toxic to certain plant seedlings

Professor N C Fassett of the University of Wisconsin explained how botanical studies had aided the geologists in fixing the limits of the vast inland fresh-water sea which once occupied the area of the Great Lakes On the margins of many existing small lakes in Wisconsin, he has found numerous species characteristic of the Atlantic seaboard that are plainly relics of the ancient vegetative zones around the margin of the great body of water, as they are now foreign to the Wisconsin flora

Professor E J Lund of the University of Texas described experiments on the electrical energy of plant cells, establishing the doctrine that all living cells generate minute but measurable currents of electricity, which regulate their growth and determine their form These currents have been checked or made to disappear by applying certain toxic substances to the cells or by depriving them of oxygen, and the subjection of growing plants to the flow of an outside current on the other hand, has caused marked modifications in their final form In the Douglas fir and white fir, the current has been shown to flow continuously upward in the outer layers of the wood and downward through the inner layers of the bark Professor Lund observed that the results of these experiments seem to open a new avenue of approach to many obscure and difficult problems in embryology, growth, and regeneration

Professor J B Overton of the University of Wisconsin has conducted investigations on the structure and chemistry of the long-lived cells of certain cacti In the giant cactus and barrel cactus, some of these cells attain an age of from 150 to 200 years They are thick-walled, with a large central cavity, and contain more dry matter, less nitrogen, and less phosphorus than young cells

From experiments made by Dr Charles Sheard and Dr A Frances Johnson of the Mayo Clinic, it would appear that plants are susceptible to the influence both of infra-red and ultra-violet rays, which are imperceptible to human beings Sunflowers and poinsettias were tested, and it was found that infra-red radiation causes a change in potential of as much as three-tenths of a volt, which is one-fifth the voltage of a new dry cell Ultra-violet rays produce a lesser change of from five-thousandths to fifteen-hundredths of a volt It has been found by these and other investigators at the Mayo Clinic that plants will sprout and grow faster beneath a glass which allows the passage of ultra-violet light These plants have the largest leaves and the greatest development of chlorophyll, although ordinary window glass produces the longest stalks

At a symposium of the Ecological Society of America, the degree to which soil acidity governs the lives of wild and cultivated plants was discussed. It was formerly assumed that acid soils were bad for all crops, but it is now known that

some will tolerate a considerable concentration, while others, as blueberries, cranberries, and the heath family in general require a highly acid soil. It is therefore possible for a skilled botanist to determine the character of a soil by inspection of its flora, even in the absence of chemical tests.

The Dutch elm disease, which has already devastated the elms of western Europe, and which may prove a menace to the American elm, was described by Dr. Christine Buismann, of the University of Utrecht. No method of control has yet been discovered, and efforts are being directed toward the propagation of resistant varieties. The disease first appeared in Holland in 1920. It is marked by curling up of the twigs and withering of the leaves. The wood of a diseased tree also shows conspicuous reddish-brown streaks. The spores are disseminated by the wind and probably enter the wood through wounds or abrasions.

**PATHOLOGY.** The somewhat unusual climatic conditions which prevailed throughout the United States during the spring and summer of 1920 resulted, as might be expected, in variable prevalence of plant diseases. The rainy weather of early spring caused an extensive infestation of apple scab in most of the apple-producing States of the eastern half of the country, while the prolonged summer droughts, although favorable to crops in diminishing rot infection, were generally conducive to the spread of rust and smut fungi. Thus, in California, alfalfa rust (*Uromyces medicaginis*) was very prominent, and this crop also suffered materially from bacterial wilt (*Aplano-bacter mactiosum*) and a disease of unknown origin. The winter wheat crop for the most part matured before the rust attacked it severely, though localities differed in this respect, Pennsylvania reporting an especially bad infestation. Corn smut (*Ustilago zea*) was prevalent in many sections, particularly in Iowa. The cotton crop suffered in Arkansas and adjacent territory from wilt (*Fusarium vasinectum*). Anthracnose of strawberries in Florida was common, and was found to be spreading. Studies were being made by the Bureau of Plant Industry in connection with the Louisiana Experiment Station on various strawberry diseases of the virus type, reported under such names as yellows, xanthosis, mosaic, yellowing, etc.

According to W. D. Valleau (*Plant Disease Reporter*, 13: 52), who had made extensive observations in Kentucky, the appearance of peach yellows in that State in small orchards and gardens is directly connected with potatoes, from which it appears to be transmitted. Peach yellows in commercial plantings had not yet been reported from Kentucky. In Georgia, it had been found necessary by the Department of Agriculture to extend the quarantine against the so-called "phony" peach disease, of which the infective principle appears to be confined to the root.

Willow scab (*Fusoidium saliciperdum*) occurs locally in practically all the New England States, New York, and the eastern Canadian provinces. Clinton and McCormick (*Conn. Agric. Exp. Station Bull.* 302: 443-469) emphasize the fact that this disease may become of increasing importance in the United States, for while the willow is of less value than some others as an ornamental tree, it has various economic uses.

Careful studies extending over a period of three years have been carried on by McMurtrey at the

Maryland Agricultural Experiment Station on the mosaic disease of tobacco. In view of the rapidity with which this disease spreads, infection should be avoided by sterilizing the seed beds, by protecting them against insects and other carriers, and by prompt burning of diseased plants. In this connection, Valleau and Johnson have found that mosaic disease may be readily communicated to tomatoes.

Lee's work on the eye-spot disease (*Helminthosporium sacchari*) of the Philippines indicated that the toxic substance which this fungus develops cannot be held in check by application of organic nitrogen fertilizers, and that the latter should be employed only when climatic conditions enable the plant to react properly to the nitrogenous stimulant.

Many important studies were conducted at the various agricultural experiment stations relating to the effects of certain chemicals on the fungi attacking cultivated crops. Thus, experiments made at the Ohio station showed the increasing effectiveness of oxidizing sulphur and dry lime-sulphur mixtures in the control of apple scab. For potato and celery blights, freshly mixed copper-lime dust, applied when the plants are moist, has been found useful. Further tests by Sayre have confirmed the efficacy of formaldehyde dusts for the control of oat smut. Investigations on the treatment of corn smut have been directed chiefly toward the production of resistant strains. Trelease (*Bull. Torr. Bot. Club*, 50: 65-92) has conducted a number of tests on wheat mildew. A relatively large surplus of carbohydrates is necessary for the abundant development of this fungus. Since carbohydrates are significant not only as materials for leaf assimilation but as sources of energy in protein synthesis, Trelease draws the conclusion that conditions tending to lower the vigor of the host decrease its susceptibility to mildew, and conversely that a more vigorous growth promotes the development of the latter. This is in accord with the results of most experiments conducted by plant pathologists, and apparently contradicts the sweeping statements made by animal pathologists as to the direct relation of lowered vitality to susceptibility.

Of the dust seed disinfectants for treating cereals now found effective in the United States, some, as copper carbonate, have come into general use, but others were just being introduced or were still in the experimental stage. Ethyl mercury chloride, sold in the United States under the trade name of *Ceresan*, gave good results in the treatment of stinking smut of wheat, and of various smuts attacking barley and oats.

#### See HORTICULTURE

**PHYSIOLOGY.** Gunnar Nilsson Leisner (*Quart. Rev. Biol.*, 4: 113-117) reviews the present status of our knowledge of plant resistance to cold. The subject is of economic importance on account of its bearing upon the question of the winter hardiness of various cereal grasses, especially wheat. In this plant, the degree of osmotic pressure of the cells in a state of incipient plasmolysis is closely associated with the reducing power of the leaves, their nitrogenous constituents and the quantity of dry matter contained. Reference is made to the long and intensive experimental study of this topic conducted by Åkerman (*Studien über den Kältetod und die Kulturresistenz der Pflanzen nebst Untersuchungen über die Winterfestigkeit des Weizens*). It is, of course, a well-known fact that some plants exhibit a

high degree of cold resistance, while others are quickly affected by any fall in temperature below a certain point. In their studies of methods of influencing the effects of chilling, Sellschop and Salmon found that potassium nitrate in solution afforded considerable protection, while potassium chloride also was efficacious, but to a less degree.

Schertz studied the effects of nitrogen, potash, and phosphorus upon the production of chloroplast pigments and the resulting crop production. He found that nitrogen greatly increases pigmentation in cotton and potato, while phosphorus has a similar, though less marked effect. Potash, on the other hand, suppresses the formation of chloroplast pigments in potatoes and to some extent also in cotton.

There have been extensive investigations by various plant physiologists on the importance of boron in fruiting or hindering growth. Johnson and Davis (*Proc. Physiology* 4: 31) state that this element must be regarded as essential to the growth of many of the higher plants. Thus, the melon and certain legumes require it although various cereals apparently reach full development in its absence. On the other hand A. R. C. Haas (*Bot. Gaz.*, 88: 113) finds that boron, even when present in a relatively small degree of concentration, is toxic to fruit trees, causing mottled and chlorotic foliage. This effect may be remedied if the boron is leached out of the soil by copious applications of water. In connection with the same phase of the subject, Kelley and Brown noted that certain irrigation waters in California containing concentrated borates are distinctly toxic to walnut and citrus trees. Further experimentation with various cultivated crops would apparently yield information of economic value.

In their studies on the effects of light, temperature, and amount of carbon dioxide on flower and fruit production, Arthur and Guthrie found that a number of plants, including the sweet pea, petunia, and snapdragon, flowered profusely under a 24-hour illumination. Additional amounts of carbon dioxide in the air increased both the height of the plant and the number of flowers. It was found also that various grains developed well, even at high temperatures, if given increased light and carbon dioxide (*Mem. Hort. Soc.*, N. Y. 3: 73-74).

H. C. Joseph demonstrated that the seeds of various plants germinate more freely after a period of dry storage. Thus, the seeds of black birch (*Betula lenta*), when freshly harvested, did not exceed a germination of 17, and sometimes not over 2 per cent sprouted. After one month, the germination percentage was 11-41 at 32° C., and 39-48 at temperatures between 15 and 32° C. Ernst C. Smith (*Mycologia*, 21: 321), in the course of experiments on the longevity of spores of the slime fungi (*Myxomycetes*) found that they exhibited extraordinary vitality, extending in some cases to nearly thirty-two years. The percentage of viable spores was often as great as in cultures a year or less old.

The interesting investigations conducted by Otto Stocker on the salt plants of Egypt show that in this particular group, at least, the structural type of the plant is of more importance in water regulation than is generally supposed. The fluctuation in surface transpiration of a single type of plant is less than that between different plant types within a single habitat.

The Entomophthoraceae, a family of phycocetous fungi, is of interest to plant physiologists in that it affords, among its five genera, a complete series from the specialized parasite like *Completoaria*, restricted to fern prothalli, to the true saprophytes such as *Conidiobolus*, which grows on decaying wood. Sawyer cultivated *Entomophthora sphaerosperma*, hitherto regarded as an obligate parasite, on artificial media prepared from potatoes, fish, etc., the presence of proteins in the media being apparently essential. The dividing line between parasite and saprophyte is therefore much less definite than was formerly believed.

GENERAL STUDIES. Woodhead (*Journal of Ecology*, February, 1929) gave a valuable account of the evolution of plant societies in the southern Pennines. Until late glacial times, the vegetation was typical tundra, which probably persisted until about 8000 B.C., when trees and shrubs began to appear. Forest development attained its climax about 6000 B.C. in the early boreal period. With the advent of a warmer and moister climate (4000-3000 B.C.), the forest degenerated and was replaced by moors in which cotton grass (*Eriophorum vaginatum*) was the dominant plant. After a partial return to dry conditions in the sub-boreal period (2000-1000 B.C.) the moors were invaded by heaths, while the moist, cool climate of the sub-Atlantic period, extending to recent times, has permitted the differentiation of plant types characteristic of the present flora of the region.

W. D. Francis found that there is not the same regularity in the growth of Australian conifers as in those of Europe and America. Sections of *Araucaria cunninghamii*, for example, show that the rings occur in various numbers, each group of which was apparently produced in a single year. This is of interest in view of the general popular impression that the age of any tree may be determined by counting the annual rings. H. Uittien, in studying the relation between leaf venation and branching, establishes the general principle that palmate leaves are found in connection with cymose inflorescence, while pinnate leaves occur with racemose inflorescence. The leaf shape of lances is not the result of adaptation but is likewise connected with the type of branching characteristic of the main stem.

F. O. Bower completed his work on the phylogeny of the ferns (*The Ferns, Filicales*, vol. II, Camb. Univ. Press). He considers that comparative morphology and paleontology must still remain the foundation for taxonomic conclusions. Fluctuating variations, he believes, may become permanent and give rise to new forms. Professor G. F. Ferris of Stanford University, in a recent review of the general subject of systematic botany as affected by modern studies in genetics, the mutation theory, etc., noted that it might easily be possible for two organisms to have a close somatic resemblance and yet to be quite widely separated genetically, while the reverse, of course, would be equally possible. Groups may exist side by side, as Morgan had remarked, so closely similar that only an expert can separate them, and yet may be infertile when crossed or may produce only sterile progeny. It is true, as Ferris pointed out, that our whole body of systematic theory is built up on the idea of continuity, and the theory fails if discontinuous variation is accepted as the chief factor in evolution. There is no definite evidence, however, that abrupt

mutations have played such a rôle, and if minute mutational changes are accepted, there is no especial conflict between the mutation theory and the idea of continuity. It may be noted as pertinent to this discussion that Boyer stressed the value of studying wood anatomy in conjunction with morphological differences in botanical classification. He cites examples among the Flacourtiaceae in which the wood structure corroborates the taxonomic arrangement (*Bull. Jard. Bot. Botenborg*, 9 223-248).

F. J. Seaver published a monograph on the hitherto neglected operculate fungi of the order, Pezizales, which he treats under two families, the Pezizaceae and Elvelaceae (the North American Cup Fungi [Operculates]). A J. Grout had in preparation a comprehensive moss flora of North America, of which the first volume had already appeared. It contains full descriptions of the families and genera, with keys to both genera and species. Many botanists were collaborating on the monumental Flora of North America, which was being issued by the New York Botanical Garden, and several new parts were published during the year.

Much experimental work in genetics was carried on. It was probable, as Dilliers has pointed out, that future investigations would concentrate more and more upon the relationship of genetics to developmental physiology and morphology. See **EXPLORATION**.

**BOTULISM** Various health departments and medical journals continued to warn the public of the dangers of home canning. An outbreak occurred in an Italian settlement in Westfield, N. Y., at Christmas time, from home-canned string beans. But eight cases were reported, yet since four patients succumbed, the episode was serious. Canned string beans have now been responsible for 39 outbreaks of the disease. It is evident that a propaganda of some sort should be directed against the menace and the public instructed as to what must be done and what avoided to secure safety. The information just given is found in an editorial in the *Journal of the American Medical Association* for February 2, and in the February 16 number there is an editorial which points out that the poison of the disease may exceptionally be inoculated from without. Thus far, no case has ever been reported, but the *bacillus botulinus* is regarded as a constituent of the soil and any suspected food should not be thrown out as garbage but destroyed. Even if rendered edible by prolonged and intense heat, it would seem wiser to refrain from eating such food articles. Another hypothesis is that some who partake of the latter are infected because of some weakness of the digestive system. This view is so far without a

**BOUCICAULT**, Dion, English actor and producer, died in Hitley, Buckinghamshire, June 25, 1929. He was born in New York City, May 23, 1830, of a family of actors. His father, Dion Boucicault, the famous Irish dramatist and actor, was an important figure in the Victorian theatre. Dion, the son, educated in England and Paris, at the age of 20 made his first stage appearance in the Booth Theatre in New York in 1879. The following year, he appeared in London. As a director, he won a name for himself in Melbourne, where he produced the current successes by Jones, Wilde, and Pinero. His chief contribution to the theatre, however, was his pro-

duction of the plays of Barrie and Milne. As an actor, he was at his best in rôles such as Sir William Gower in *Trelawny of the Wells* and Carriaway Pim in *Mr. Pim Passes By*. He married the actress, Irene Vanbrugh.

**BOULDER CANYON DAM**. See **DAMS**.  
**BOUNDARY DISPUTES**. See **ARBITRATION**, **INTERNATIONAL**.

**BOURDELE**, Émile Antoine, French sculptor, died in Paris, Oct. 1, 1929. He was born Oct. 30, 1861, in Montauban, of humble parents. His father was a wood carver, who specialized in restoring antique furniture. M. Bourdelle received no formal education, but studied art in Paris under Rodin, whose most highly esteemed follower he became. Archaic Greek and Gothic sculptures were the chief influences on his art, which was architectural in nature. Among his works are monuments to the defenders of Montauban (1902), to the Polish poet Mickiewicz (1917), to General Alvear in Buenos Aires (1915-17), and to the miners of Monceaux who fell in the War, "The Archaic Heroes" (1909), replica in the Metropolitan Museum of New York City), reliefs on the Théâtre des Champs Élysées in Paris, a colossal equestrian statue and four "Force" figures, of which "Force" and "Victory" have been called the finest pieces of sculpture the World War produced, busts of Beethoven (Luxembourg Museum), Rodin, Ingles, Anatole France (1919), and M. Simu (Bibliothèque), and Sir James George Frazer (1922).

**BOUVET (Bouvet) ISLAND**, A small island in the South Atlantic (Lat. 54° 20' S., Long. 3° 24' E.) belonging to Norway. It was first sighted by Louis-Bouvet in 1739 but remained unoccupied until a Norwegian expedition in the whaler, *Norvegia*, landed and took possession in December, 1927. British claims to the island, based upon an unauthenticated report of a landing made by Captain Norris in 1825, were waived in favor of Norway in 1928.

**BOWDOIN COLLEGE**. An institution of higher education for men in Brunswick, Me., founded in 1794. The autumn session of 1929 had an enrollment of 519, distributed as follows: Seniors, 115, juniors, 138, sophomores, 138, freshmen, 154, and specials, 4. There were 55 faculty members. The productive funds of the college amounted to \$5,053,000, and the income for 1928-29 was \$417,710. There were more than 150,000 volumes in the library. President, Kenneth Charles Morton Sills, LL.D.

**BOWLING**. The twenty-ninth annual tournament of the American Bowling Congress attracted a record entry of over 12,000 bowlers from over 200 cities in the tournament held at Chicago. Adolph Ulke of Milwaukee captured the singles title, while the doubles championship went to Butler and Klecz of Chicago. Otto Stein, Jr., of St. Louis won the all-around title, while the five-man team championship was garnered by the Hub Recreation quintet of Joliet, Ill.

**BOXING**. The continued dullness in heavyweight boxing in 1929 was coincident with the death early in the year of the game's greatest promoter, George Lewis "Tex" Rickard, who had built up the game and had produced the spectacular and lucrative "Battles of the Century" and had developed such national figures as Jack Dempsey, Louis Fippo, and Gene Tunney. William F. Carey, millionaire business man, carried on Rickard's Madison Square Garden enterprises and, aided by Dempsey, staged a bout between

Jack Sharkey and Young Stirling at Miami. This fight in the picturesque setting was another dull affair and did nothing toward settling the possession of the title. The race for the Muldoon-Tunney Trophy, emblematic of the heavyweight championship of the world made little progress and the only contenders of worth at the end of 1929 were Jack Sharkey and Max Schmeling, of Germany. The latter knocked out Johnny Risko at Madison Square Garden in New York in February and battered Paulino Uzeudun, the Basque, in the Milk Fund Show in June. It was generally considered at the end of the year that the winner of a fight between these two would settle the ownership of the trophy and title.

Three world's championships in the lighter division changed hands during the year. Jackie Fields won the welterweight title from Joe Dundee on a foul in the second round at Detroit in July, while Battling Battalino captured the featherweight title by outpointing Andie Routs of France in a 15-round bout at Hartford, Conn., in September. Tod Morgan of Ast Sequim, Wash., lost the junior lightweight title which he had held for four years to Benny Bass, a Philadelphian. Bass stopped Morgan in the second round of a scheduled 15-round fight at Madison Square Garden on December 20.

Sammy Mandell, lightweight king, turned back Tony Canzone in a titular fight at Chicago August 2, while Mickey Walker, ruler of the middleweights, beat Ace Hudkins, the Nebraskan, in a hard fight for the 160-pound supremacy on October 29, at Los Angeles. Tommy Loughran, light heavyweight champion, abdicated his throne but was soundly beaten by Jack Sharkey at the Yankee Stadium in his first important venture into the heavyweight ranks. Al Brown, Panamanian Negro, won recognition from the National and New York Commissions as bantamweight champion.

Penn State won the Eastern Intercollegiate team championships. In the amateur classes, the winners of the national crowns were flyweight, James Herr, Grand Rapids, bantamweight, Albin Holden, Providence R. I., featherweight, Martin Zungu, Los Angeles, lightweight, Steve Halaiko, Buffalo, N. Y., welterweight, Leslie Baker, Watertown, Mass., middleweight, Ray Lopez, Boston, 175 pounds, Martin Levandowski, Grand Rapids, Mich., heavyweight, Ralph Ficucello, New York.

#### BOYNE, BATTLE OF SEE CELEBRATIONS

**BOY SCOUTS OF AMERICA.** An organization incorporated in 1910 and chartered by Congress in 1916 to develop the character of boys and train them for the duties of adult life by influence brought to bear in their work and play. Its national constitution declares the intention to "promote the ability of boys to do things for themselves and others, to train them in scoutcraft, and to teach them patriotism, courage, self-reliance, and kindred virtues." Each boy, on joining the organization takes the scout oath, admonishing him to keep himself "physically strong, mentally awake, and morally straight." The scout law requires him to exert such qualities as trustworthiness, loyalty, helpfulness, friendliness, courtesy, kindness, obedience, cheerfulness, thrift, bravery, cleanliness, and reverence. The movement is nonsectarian and without military or political connection.

The membership in 1929 included 819,339

boys and 219,146 scout leaders. There were 12 regional scout districts under the direct supervision of the national scout executives and subdivided into 643 local councils. The boys are organized into troops consisting of 32 members, each troop being made up of patrols of eight or less members under a boy leader. A scoutmaster, commissioned by the national council, is provided for each troop; he must be an adult citizen of proved fitness for boy leadership. Troops are commonly formed in connection with schools, churches, or other existing bodies, and each must be sponsored by a troop committee of three or more adults, who select the scoutmaster and supervise the execution of the programme. In small areas, a farm or home scout patrol may be formed with as few as two boys, and a boy who lives in an area so isolated that he cannot join a troop or patrol may become a lone scout.

Among the foremost scout activities are camping and hiking, nature study, sea scouting, and many kinds of athletics and crafts, such as swimming, first aid, signaling, knot-tying, and bridge building. Successive ranks in membership—tenderfoot, scout, and first class—are achieved by passing tests graded in difficulty. Merit badges, 90 in number, may be attained by the scout of first-class rank by meeting requirements for each; they cover proficiency in pursuits both of the useful and the hobby type. By winning a certain number of merit badges, a boy may rise to the higher ranks of star, life, and eagle scout. In 1929 the organization provided opportunity for 300,000 boys to spend a week or more in summer camp. There were 652 camps conducted by local councils and more than 2400 troop camps. In its community service, the boy scout movement cooperates with the U. S. Forestry Department in fighting and preventing forest fires and in conserving wild life and planting trees. It also renders services in local campaigns of various sorts, such as clean-up and safety-first campaigns, and cooperates with many national societies and movements.

The official magazine for boys is *Boys' Life* and for scout leaders, *Scouting*. The organization also publishes merit-badge pamphlets, handbooks, and other material pertaining to the movement. The national officers in 1929 were President, Walter W. Head, treasurer, George D. Pratt, national commissioner, Daniel Carter Beard, international commissioner, Mortimer L. Schiff, chief scout executive, James E. West, deputy chief scout executive, George J. Fisher. Headquarters of the national council, the governing body, are at 2 Park Avenue, New York City.

**BRAZIL.** The largest of the South American republics, situated in the northern and eastern part of the continent of South America, a federal republic. Capital and largest city, Rio de Janeiro. The site for a new Federal capital was selected in the state of Goyaz.

**AREA AND POPULATION.** The area of Brazil is given at 3,285,318 square miles, which gives it an area more than 250,000 square miles greater than that of the continental United States. The country is divided into 20 states, one territory and one federal district. According to the census of 1920, the population of the Republic was 30,635,005, which represents a density of 93 inhabitants to the square mile. The principal cities with their populations, according to the same census are Rio de Janeiro, 1,157,873, São Paulo,

579,033 (estimated at 1,000,249 in December, 1928); Bahia, 283,422, Recife, 238,843, Belem, 236,402; Porto Alegre, 179,263. According to statistics furnished by the Statistical Bureau, the population of Brazil on Jan. 1, 1929, totaled 39,103,856, an increase of 27.6 per cent. over that of the 1920 census and of 21,785,300, or 126 per cent., over the 1900 census. In 1926 the population was divided among the states, territory, and federal district as follows:

Afagôas, 1,117,045, Amazonas, 409,699, Bahia, 3,859,241, Ceará, 1,520,335, Federal District, 1,300,586, Espírito Santo, 587,451, Goyaz, 640,491, Maranhão, 1,047,206, Matto-Grosso, 312,661, Minas Geraes, 6,902,511, Pará, 1,269,344, Parahyba do Norte, 1,193,260, Paraíba, 870,255, Pernambuco, 2,617,310, Piahy, 738,740; Rio de Janeiro, 1,844,304, Rio Grande do Norte, 666,903; Rio Grande do Sul, 2,683,683, Santa Catharina, 847,656, São Paulo, 5,751,822, Sergipe, 524,095, Acre Territory, 106,374.

Immigration to Brazil declined from 121,569 in 1926 to 101,568 in 1927 and to 82,061 in 1928. The Portuguese, who form the bulk of the immigrants, numbered 42,882 in 1928, 31,236 in 1927, and 38,791 in 1926. Japanese immigrants in 1928 totaled 11,169 and Italians, 5493. National and state authorities encourage immigration in every way. The State of Pará granted 2,500,000 acres of land in Acuria to the South American Development Company, a Japanese concern, which plans to settle 40,000 Japanese on this area within ten years. A German syndicate received a concession for the development of the cocoa fibre industry on 21,000 acres of land in the state of Maranhão. Another concession made to Henry Ford for a rubber plantation by the State of Pará included about 2500 square miles.

**EDUCATION.** Education is free but not compulsory, except in seven states where it is both free and compulsory. In 1926 there were in the various states 30,650 primary schools with 1,470,000 pupils, 212 secondary schools, and 367 professional schools with more than 37,000 pupils. There are also 76 schools which train teachers, 97 industrial schools, 41 agricultural, and 48 commercial schools, besides one official university, the University of Rio de Janeiro, and two private universities.

**PRODUCTION, ETC.** Brazil is primarily an agricultural country with coffee the dominant factor upon which the whole economic well-being of the nation depends. The total cultivated area covers 14,880,000 acres, of which 5,145,554 are in São Paulo, 2,805,139 in Rio Grande do Sul, 2,641,156 in Minas, and 4,288,800 in other states. Every year, coffee accounts for between 60 and 75 per cent. of Brazil's total exports, the remaining 25 to 40 per cent. being divided among a number of minor products. Of these, rubber is notable because although it is indigenous to the Amazon Valley, competition from eastern plantation rubber which is produced more efficiently and economically in the East Indies has deprived Brazil of first place in world production since 1912, and only recently have serious attempts been made to systematize and increase production. Cacao is also of superior importance because Brazil produces about 13 per cent. of the world supply of this product, being surpassed only by British West Africa. Brazil has great potentialities as a producer of vegetable oil, but this industry is not yet well developed. Brazil nuts constitute more than half of the values of exports of

oilseeds and kernels, the remainder being made up largely of palm nuts, cottonseed, and castor seed.

Owing to the vast extent of its agricultural area, the average holding is of large size. Only a small portion is cultivated, but statistics indicate a rapid increase in recent years. Public lands in Brazil are the property of the several states of the republic, except in such cases where titles have been transferred to the Federal government for special purposes.

Farm land in Brazil in 1929 was valued at a total of \$1,351,945,311 (10,556,031,291 milreis) and was divided among different nationalities as follows: Brazilians, 8,263,478,386 milreis, Italians, 466,083,388 milreis, Portuguese, 259,147,761 milreis, Spaniards, 77,525,560 milreis, Ukrainians, 72,865,060 milreis, Germans, 60,187,127 milreis, Austrians, 30,526,300 milreis, Russians, 20,266,337 milreis.

In 1927-28 Brazil produced 28,334,000 bags of coffee (1 bag equals 132 pounds), while the total production of all other countries was 8,003,000 bags. São Paulo, Rio de Janeiro, Espírito Santo, and Minas Geraes are the principal coffee-growing districts, the production of São Paulo in 1928 amounting to 19,381,010 bags. Production of other chief crops in 1927-28 (in metric tons) was: maize, 4,066,136, rice, 890,023, tapioca, 193,023, sugar, 777,715, potatoes, 193,023, yerba maté, 187,048, wheat, 114,398, tobacco, 67,811, cacao, 51,770, rubber, 27,976. The area under cotton was 1,177,862 and the output, 106,660 metric tons of raw cotton, equivalent to 473,370 bales when ginned. The total value of all crops in 1927-28 was estimated at \$972,000,000.

Livestock in the country at the census of 1920 included 34,271,321 oxen, 16,168,549 swine, 7,933,447 sheep, 5,086,655 goats, 5,253,699 horses, and 1,865,259 asses and mules.

Brazil's forests and mines are important, the former providing exports valued at \$2,689,107 in 1928, mostly in the form of Parana pine. Coal of an inferior quality is found in the states of Rio Grande do Sul, Santa Catharina, Parana, and São Paulo and is usually pulverized for market. The annual output is about 370,000 tons. An iron ore deposit, believed to be one of the richest in the world, was being developed at Itabira. Gold, diamonds, manganese ores, and monazite also are mined. Exports of manganese in 1927, chiefly to the United States, totaled 241,823 metric tons.

Cotton weaving is the most important manufacturing industry in Brazil, 357 factories with 2,584,050 spindles, 78,383 looms, and 128,613 operatives being active in 1927. The total value of all cotton products in that year was 974,555,000 milreis (1 paper milreis equals \$0.1196 par). There are also 13 silk, 35 woolen, and 16 jute mills, 23 paper mills, over 2000 tobacco factories, about 216 sugar factories (production in 1927, 850,565 tons), and 13 packing houses.

**COMMERCE.** Constant fluctuations in foreign exchange and the price of coffee since the beginning of the World War have caused much uncertainty in Brazilian business. The signing of the stabilization bill on Dec. 18, 1926, removed, however, some of this difficulty. Aside from the exchange, the coffee movement is the most important single factor in Brazilian trade activities inasmuch as it approximates three-quarters of Brazil's entire export trade. In order to minimize violent price fluctuations and to combat a tend-

ency to decline during recent years, the São Paulo Coffee Defense Institute resorted to a policy of restricting shipments of stocks from the interior to Santos, the world's principal coffee export port, thus curtailing sales and maintaining price levels even in the face of record-breaking crops. Although the coffee crop for 1928-29 was considerably smaller than for the previous year, it was estimated early in 1929 that an amount almost equivalent to a full year's normal exports was being withheld from the market. Doubt as to the ability of the Institute to maintain the price of coffee in the face of increasing production elsewhere and what promised to be another bumper crop in 1929-30, led to a feeling of uncertainty in all lines and business remained dull throughout 1929.

The United States is by far the best customer Brazil has, and it likewise furnishes a larger percentage of Brazil's imports than does any other country. In 1927 the United States took 45 per cent of Brazil's exports, and sold to Brazil 29 per cent of its total imports. While the

In 1928 Brazilian imports amounted to 5,694,990,000 milreis paper (\$442,290,000), an increase of 2,421,827,000 milreis paper (\$64,748,000), or 14.1 per cent, as compared with imports for 1927. Exports in 1928 were valued at 3,970,273,000 milreis paper (\$475,242,000), as compared with 3,644,118,000 milreis paper (\$431,464,000) in 1927, an increase of 10.1 per cent. While there was a favorable balance of trade for the year, the difference between exports and imports showed a steady diminution during the year and in November and December there was an unfavorable balance. The effect of restrictive measures taken by the Coffee Defense Institute was indicated by the fact that exports of coffee increased in value from \$304,000,000 in 1927 to \$339,097,075 in 1928, while the quantity from 15,115,000 bags in 1927 to 15,115,000 bags in 1928, an increase of 10.1 per cent. Coffee comprised 71.5 per cent of all exports in 1928 and about 77 per cent in 1927.

The leading exports in 1928, with comparative figures for 1927, are shown in the accompanying table.

## BRAZILIAN EXPORTS, BY PRINCIPAL ARTICLES

	Quantity		Value *	
	1927 Tons	1928 Tons	1927 Milreis paper	1928 Milreis paper
<b>Class I Animals and animal products</b>				
Lard	79	21	299,000	53,000
Preserved meat	3,081	3,070	7,861,000	8,119,000

<sup>b</sup> 1 bag equals 60 kilos (132 pounds)

value of imports from the United States increased by 5 per cent in 1928 over 1927, imports from Germany showed a 25 per cent increase, from the United Kingdom, an increase of 13 per cent, from Italy, an increase of 18 per cent, and from Belgium, an increase of 9 per cent. The United States supplied 27 per cent of all imports in 1928, and purchased 46 per cent of all exports. Of Brazil's exports to the United States, over 92 per cent consisted of coffee shipments. In Brazil's import trade, the United States figures conspicuously as a supplier of automobiles, petroleum products, motion pictures, wheat flour, agricultural and industrial implements and machinery, barbed wire, hardware, paints and varnishes, coal, electrical goods, hides and skins, leather, and other manufactures.

Manufactures constituted by far the largest part of Brazilian imports in 1928 totaling \$256,030,132, as compared with \$216,974,813 in 1927. The value of imports of live animals and of primary materials used in the arts and industries was \$81,473,394 (\$86,053,565 in 1927); the value of imports of foodstuffs and fodder, \$441,825,809 (\$387,035,046 in 1927). Leading articles of import were iron and steel manufactures, cotton piece goods, machinery, apparatus, utensils, and tools, wheat, fuel, automobiles, gasoline, flour, and chemicals.

Export statistics for 1928 show that all commodities which increased in value also increased in volume, except coffee and preserved meats, which both showed increases in value and decreases in volume. In every case where the value

decreased the quantity did likewise. The drop in the value of rubber and of cacao exports was out of normal proportion to the decrease in volume, however Rubber decreased in quantity by 28.6 per cent and in value by 48.9 per cent, while cacao decreased in volume by 4.2 per cent and in value by 19.8 per cent. In general, prices for exports were higher, the volume of all exports increasing by only 2.86 per cent, while the value increased by 9.85 per cent. More than half of the cacao exports went to the United States. Imports from the United States were slightly higher in 1929 than in 1928, but exports to that country declined largely due to low coffee prices.

FINANCE Brazilian revenues exceeded expenditures by 198,354 paper contos (the paper conto equals approximately \$120) in 1928, as compared with a surplus of only 30,851 contos in 1927.

As originally enacted by Congress, the 1928 budget law showed a deficit of 151,990 contos, but the President exercised his veto privilege and, as finally signed, the budget provided for a surplus of 116 contos. Actual receipts amounted to 2,216,512 contos, or 127,579 contos more than the budget estimate. To the expenditures of 1,922,161 authorized by the budget were added extraordinary expenditures of 95,097 contos, making a total expenditure for the year of 2,018,158 contos. In 1927 the revenue totaled 2,039,505 contos, the budgeted expenditures, 1,631,847 contos, and extraordinary expenditures, 376,807 contos.

The increase of 8.7 per cent in revenue in 1928 over the previous year was due almost entirely to the increased volume of business, no new taxes having been imposed or changes made in existing rates. Customhouse collections at both Rio de Janeiro and Santos showed a 15 per cent increase for the year. The principal sources of revenue in 1928 were imports and shipping, 122,559 contos; consumption taxes, 440,308 contos; stamp duties, 251,783 contos; industrial revenue, 287,785 contos; income tax, 68,238 contos.

Total expenditures for 1928 were 170,675 contos less than the budget estimate, the principal savings being effected by the departments of public works and communications, of finance, and of agriculture. Actual budgetary expenditures by the various departments are shown in the accompanying table.

#### BRAZILIAN BUDGETARY EXPENDITURES, 1928

Department	Gold contos	Paper* contos
Justice	218	144,777
Foreign affairs	6,014	3,635
Navy	1,045	129,499
War	200	241,797
Agriculture	671	61,908
Public works and communications	11,230	415,767
Finance	104,023	352,470
Total	125,401	1,349,453
Conversion of gold items at 4567		572,708
Total in paper currency		1,922,161

\* Paper conto equals about \$120

The budget for 1929 estimated revenues at 2,210,770 paper contos, or an increase of 121,837 contos over the 1928 estimate. Authorized expenditures amounted to 2,117,367 contos, which is 93,403 contos less than the estimated revenues but 28,551 contos more than those authorized

in the 1928 budget. The itemized revenue estimates for 1928 and 1929 are shown in the accompanying table.

#### BRAZILIAN ITEMIZED REVENUE ESTIMATES

Item	1928 Paper contos*	1929 Paper contos
Imports and shipping	911,977	925,595
Consumption taxes	377,845	449,466
Stamp taxes	237,626	250,097
Income tax	87,466	72,871
Lottery tax	2,472	2,240
Sundry revenues	18,580	20,172
Patrimonial revenues	14,488	15,749
Industrial revenues	287,377	326,358
Extraordinary revenues	68,143	88,093
earmarked revenues	124,151	97,814
Total	2,125,545	2,248,447
Deduct revenues set aside for paper money guarantee fund	86,612	37,677
Total	2,088,933	2,210,770

\* Gold items in 1928 budget converted at a rate of 45675 paper contos to 1 gold conto

Departmental expenditures (in paper contos) authorized in the 1929 budget follow: Justice and Interior, 144,320; Foreign Affairs, 31,482; Marine, 155,642; War, 276,140; Agriculture, 76,900; Public Works and Communications, 552,085; Finance, 880,798. The last item included 103,277 gold contos (1 gold conto equals 4567 paper contos) for the service of foreign obligations and the sum of 136,395 paper contos for the service of the internal debt. Provision was also made to carry into effect the law of Dec 28, 1928, effective Jan 1, 1929, providing for a 100 per cent increase in the salaries of all public functionaries over the salaries received in 1914, 80,000 paper contos being set aside for this purpose.

Reductions in the external debt of Brazil during 1928 totaling 131,586 contos were distributed as follows: £2,315,885, \$4,089,840, francs, 1,976,744. On Jan 1, 1929, the foreign debt stood as follows: £106,968,592, \$152,800,427, francs, 333,577,086. On the same date the internal debt amounted to 2,392,746 contos, having been reduced during the year by 78,333 contos.

According to the President's message, the note circulation on Jan 1, 1929, amounted to 3,379,025 contos, including treasury notes (inconvertible), 1,951,724 contos; Bank of Brazil notes (secured by £10,000,000 gold reserve), 592,000 contos; Caixa de Estabilizacao notes (convertible), 835,301 contos.

The proposed budget for the fiscal year 1930, as presented to the Brazilian Congress, calculated revenues at 199,111,700 milreis gold and 1,365,295,700 milreis paper (1 milreis paper equals \$0.1196 par); and expenditures at 134,829,782 milreis gold and 1,609,061,299 milreis paper. The gold surplus is equivalent to 293,575,517 paper milreis, giving a projected surplus for the year of 48,809,907 paper milreis.

Stating that the stabilization plan had achieved success, the President in his message, pointed out that during the two years it had been in operation, milreis exchange had been kept between the low rate of 5 pence and high rate of 5 1/2 pence, or below the gold point. During 1928 two methods were employed to carry out the Government's policy of monetary reform, the principal object of which was to secure convertibility of the currency—increasing the gold deposits and the destruction of inconvertible paper currency. The

President also announced that steps had been taken, in accordance with the stabilization act of Dec. 18, 1926, toward the reorganization of the Bank of Brazil as a central bank of issue and discount.

**COMMUNICATIONS** On Jan. 1, 1928, the total length of railway lines in Brazil was 19,544 miles, of which 14,615 miles were owned by the Federal government and 4928 miles by the states. The principal railway, the Central Brazil Railway (1799 miles), is government owned. The railways are linked with those of Argentina, Uruguay, and Paraguay. In 1929 there was much railway building in São Paulo, and other states. The length of highways was placed at 33,452 miles in October, 1928, 5161 miles being first-class roads. A Department of Roads was established in 1928 to further national highways. The Second Pan-America Congress met in Rio de Janeiro Aug. 15-17, 1929, with official delegates from nineteen countries in attendance. Of the 61,000 miles of telegraph line, 32,672 miles are Federal property. Forty wireless stations, including one very powerful one, have been established.

Air-mail and express service between Rio de Janeiro and São Paulo was begun on July 28, 1929.

**GOVERNMENT** The executive power is vested in the President, who with the Vice President is elected directly by the people for four years and is ineligible for reelection, and the legislative power in the National Congress which consists of the Chamber of Deputies and the Senate, the former having 212 members elected for three years by popular vote on the basis of minority representation, and the latter, 63 members elected for nine years by direct vote, one-third being retired every three years. The Vice President presides over the Senate. President in 1929, Dr. Washington Luis Pereira de Souza (assumed office Nov. 1, 1926), Vice President, Mello Vianna.

**HISTORY** Except for the excitement incident to a presidential campaign and the continued increase in the cost of living, the year 1929 was a comparatively uneventful one for Brazil. Treaties for the peaceful delimitation of sections of Brazil's boundaries heretofore undefined were concluded during the year with Paraguay, Colombia, Bolivia, and British Guiana. The treaty with Colombia, ratified by the Brazilian Congress in November, 1928, and by Colombia, on Nov. 15, 1929, provided for reciprocal perpetual free trade in the Amazon and its tributaries. The treaty with Paraguay fixed the boundary line between the mouth of the Apa River and Bahia Negra, which was left unsettled by the treaty of 1872. Ratifications of the Brazil-British Guiana Treaty were exchanged April 16.

The leading candidates for the presidency were Julio Prestes, Governor of the State of São Paulo, Antonio Carlos, Governor of the State of Minas Geraes, and Getulio Vargas, Governor of the State of Rio Grande. Indications were that the President would support the candidacy of Governor Prestes. On December 20, during the heat of the campaign, Deputy Simoes Lopes of Bahia shot and seriously wounded Deputy Souza Filho of Rio Grande on the floor of the Federal Chamber of Deputies. President Pereira de Souza denied rumors that the Government was concentrating troops in Rio Grande in anticipation of disorders during the election in 1930.

The cost of living in Brazil had continued to rise steadily since the beginning of the World War and particularly since 1919, despite various steps by the Federal and state governments to relieve the situation, such as the purchase and distribution of supplies by the Federal Food Administration, temporary exemption of certain foods from import duties, and the operation of street markets. The index figures for staple foodstuffs in Rio de Janeiro, with 1914 prices taken as representing 100, are as follows: 1926, 275; 1927, 283, 1928, 284, January, 1929, 289. No decrease in the cost of living is expected for some time and the problem has become one of serious concern to a large part of the population and to the Federal, state, and municipal governments.

Overproduction of coffee led to requests for a moratorium or the issuance of paper money, which were refused by the President at a conference with coffee growers and business men from São Paulo and Santos on October 29. The coffee valorization plan adopted by the Coffee Institute in an attempt to regulate the production, sale, and price of coffee was widely debated, there being considerable agitation for its abandonment.

The traditionally friendly relations between the United States and Brazil continued. That President Hoover's good-will visit to Latin America would result in a new Monroe Doctrine based upon the more friendly relations between the Pan-American nations growing out of new and powerful economic interests, was predicted by some observers in Brazil. The proposed American tariff, which aroused violent resentment in Argentina and other South American countries, was favorably treated in the Brazilian press for what was considered its fairness toward Brazilian products. T. Cox, formerly connected with the U. S. Forest Service, accepted an appointment to organize a national forest service for Brazil.

The worst epidemic of yellow fever since 1903 visited the country during the first half of 1929, one of the victims being Dr. Paul A. Lewis of the Rockefeller Institute, who died at Bahia June 30, while studying the disease.

**BRECK**, EDWARD, American naturalist and author, died in Milford, N. S., May 15, 1929. Born at San Francisco July 31, 1861, he attended Oberlin College, Amherst, and the universities of Cambridge, Munich, and Leipzig, receiving the M. A. and Ph. D. degrees from the latter institution in 1887. After being an editor, and literary adviser of the Estes & Lauriat publishing house, Boston, he became editor-in-chief of *Life*, London, 1890-92, later serving as Berlin correspondent for the New York *Herald* and the New York *Times*. Breck was vice consul-general in Berlin, 1895-96, and during the Spanish-American War, 1898-99, he remained in Berlin as assistant to the United States Naval Attaché, until made secret agent in Spain. From 1914 until 1916, Breck lectured on naval subjects, and he was commissioned lieutenant commander in the U. S. Naval Reserve, Feb. 13, 1917, serving in the secret service until March, 1918. He was then made military attaché in Portugal, and his next position was that of executive of the historical section of the Navy Department, 1919-22. Breck was retired from the Naval Reserve on account of age, July 31, 1925. He was awarded the Navy Cross, the French Legion of Honor, the Portuguese Order of Avis, Order of Christ, the

Distinguished Service Medal, and the Italian War Cross. Besides contributing to periodicals articles on the navy, nature, and sports, Breck edited the *Living Age* in 1923, and was naval contributor to the *Dictionary of American Biography* from 1926 until his death. He wrote *De Consuetudine Monachorum* (1887), *Art of Fencing* (1894), *Way of the Woods* (1908); *Sporting Guide* (1909), *Wilderness Pets* (1910), *The American Naval Railway Batteries in France* (1920); *Armed Guards on American Merchant Ships* (1921), *The Steel-Trap* (1925); and *The Lady and the Trapper* (1927).

**BRENT, CHARLES HENRY** Protestant Episcopal Bishop of Western New York, died in Lausanne, Switzerland, Mar. 27, 1929. He was born in Newcastle, Ont., Apr. 9, 1862, was graduated from the University of Trinity College, Toronto, in 1884, and became a priest of the Protestant Episcopal Church in 1887. He was curate of St. Paul's Cathedral, Buffalo, N. Y., in 1887, and in 1901 was elected Bishop of the Philippine Islands, where he served until 1918, establishing the church, building missions, and organizing schools. Here, he first identified himself with the war against the opium trade in which war he was for the remainder of his life actively engaged. He was a member of the committee appointed by the Philippine Government to investigate the opium question in the Orient, 1903-04, was president of the International Opium Commission at Shanghai in 1909, chairman of the American delegation and president of the Opium Conference at The Hague, 1911, and United States representative to the advisory committee on narcotics of the League of Nations and to the Assembly of the League in 1923. During his years in the Philippines, he refused two bishoprics offered him in the United States at Washington, D. C., in 1908, and in New Jersey in 1914.

In 1918 he was appointed to the bishopric of Western New York, and in the same year also was made chief chaplain of the A. E. F. in France. From 1926 to 1928, he was the bishop in charge of American Protestant Episcopal churches in Europe, during which time, in 1927, he was president of the World Conference on Faith and Order, which met in Lausanne and was concerned with Christian unity. Because of ill health, Bishop Brent resigned his position in Europe and at the time of his death, he was at Lausanne on a leave of absence from his bishopric of Western New York. In accordance with an expressed wish that he be buried in whatever place he might die, Bishop Brent was buried at Lausanne, with the honors due one internationally known and respected. On December 4, a tablet in memory of Bishop Brent was unveiled in the English Church of Lausanne. England made him a Companion of the Bath, and the United States awarded him the Distinguished Service Medal. He also was a Commander of Leopold from Belgium. He lectured at the General Theological Seminary in New York in 1904, at Harvard in 1907, and at Edinburgh, Glasgow, and Aberdeen in 1921. He was the author of *With God in the World* (1899), *The Consolations of the Cross* (1902), *The Splendor of the Human Body* (1904), *Liberty and Other Sermons* (1906), *Adventure for God* (1904), *With God in Prayer* (1907), *The Revelation of Discovery* (1908); *The Sixth Sense* (1911), *Presence* (1914), *Prisoners of Hope* (1915); *A Master Builder*, life and letters of Henry Yates Satterlee, (1916).

**BRETHREN, CHURCH OF THE** A church established in the United States in 1719 in Germantown, Pa. It originated in Schwarzenau, Germany, in 1708 and is the largest of the five branches of the denomination formerly known as the German Baptist Brethren or Dunkers. Other churches of this group are The Church of God (New Dunkards), Brethren Church (Progressive Dunkers), German Seventh-day Baptists, and Old Order German Baptists Brethren. The policy of the Church of the Brethren corresponds more nearly to the Presbyterian than to any other specific ecclesiastical form. It comprises 49 district conferences and holds a general conference annually. In 1929 there were 1026 churches with a membership of 134,620 and 1180 Sunday schools with an enrollment of 126,729 pupils. Foreign missionary work was carried on in India, China, and Africa, the total membership in the mission field being 5290. Expenditures for the year ending Feb. 28, 1929, totaled \$300,989. The denomination maintained 8 colleges, 1 academy, and 1 theological seminary and training school with an enrollment of 4324 students.

Officers of the general conference in 1929 were Moderator, the Rev. H. K. Oler of Elizabethtown, Pa., reading clerk, the Rev. James M. Moore of Waynesboro, Pa., and writing clerk, I. B. Book of North Manchester, Ind. The Rev. J. W. Lear of Elgin, Ill., was executive secretary of the council of boards and the Rev. Otho Winger of North Manchester, Ind., president of the general mission board. The *Gospel Messenger* is the official organ of the denomination, while the *Missionary Visitor* is the promotional periodical of the general mission board. Headquarters of the council of boards, general mission board, board of religious education, and general ministerial board are in Elgin, Ill., headquarters of the general education board are at 3535 Ordway Street N. W., Washington, D. C.

**BREUER, HANS A.** German dramatic tenor, died in Vienna, in October, 1929. He was born in Cologne, Apr. 27, 1869. After studying at the Cologne Conservatory under Ifert and Stolzenberg, he completed his training under Kniese at the Conservatory in Bayreuth, where he also made his debut as Mime, in *Siegfried*, in the summer of 1896. Such was his success, that he sang that rôle at all the subsequent festivals until their interruption in 1914. After filling an engagement for festival performances at Breslau, he came to the United States and in 1897-98 was a member of the Dammersch Opera Company. He then appeared as guest in England, Holland, Germany, and Switzerland until, in 1900, Mahler secured him permanently for the Hofoper in Vienna, where he was a prime favorite. Throughout his career, he was a regular guest at the annual Munich and Salzburg festivals. After the War, he was a stage manager at the Staatsoper and professor of singing at the Staatsakademie für Musik in Vienna. He excelled as an interpreter of Wagner and Mozart.

**BRIAND PEACE ACT.** See KELLOGG-BRIAND TREATIES.

**BRIDGEMAN, ADMIRAL SIR FRANCIS** (CHARLES BRIDGEMAN-). English naval officer, died in Nassau, Bahamas, Feb. 17, 1929. Born in Babworth, Notts, England, Dec. 7, 1848, he entered the navy in 1862. Rising through the successive grades, he was commissioned rear admiral in

1903 Having been closely associated with Lord Fisher in the organization of the Grand Fleet, Sir Francis was appointed first commander-in-chief of one of its original units, the home fleet, in the North Sea in 1907. Made a Lord of the Admiralty, 1910, he again commanded the home fleet in 1911, and from 1911 until his resignation in 1912, he served as First Sea Lord of the Admiralty. He was at one time an aide-de-camp to the King. At the time of his death, Sir Francis held the title of Vice Admiral of the United Kingdom. He was created a Knight Commander of the Bath in 1908, a Knight of the Grand Cross of the Royal Victorian Order in 1911, and a Knight of the Grand Cross of the Bath in 1912.

**BRIDGES.** The prediction of a new and great era of bridge building to follow the good-roads movement which in turn came upon the heels of the automobile, was abundantly confirmed in the astounding wave of bridge construction which marked 1929 as perhaps the greatest bridge year in history. This year certainly led the world's record for highway bridge construction and had no parallel except in the great era of railroad construction which reached a peak in the eighties of the last century. No single type of structure, from simple truss to cantilever and suspension bridges, was neglected in this advance. Indeed, comparatively new types, such as the continuous truss and the rigid frame also are to be noted. (Gustav Lindenthal's great Hell Gate Arch of 1917 has become the parent of a notable family of steel arches, while concrete has, of course, replaced cut-stone in the construction of masonry arches. The year 1929 closed with the greatest suspension bridge, the greatest steel and the greatest concrete arches that the engineer had yet produced, under construction.

The United States, with automobiles more numerous than telephones and with some 3,000,000 miles of highways, four-fifths of which were yet to be improved beyond the earth road stage, naturally was the home of most of these undertakings. Bridges on the long established roads of Europe only require infrequent replacements or renewals. Canada had not been particularly active in this field, but proposals were being considered for a notable, 960 foot span over the Narrows of Halifax Harbor between Halifax and Dartmouth, and a double-deck structure with draw span in connection with the development of St. John Harbor, New Brunswick, as a great railroad terminal and port.

**LEASING AND OWNERSHIP.** Permission to construct had been refused by the Chief of Engineers of the United States War Department in the case of a number of proposed bridges over the navigable waters of the United States. Construction in these rivers and harbors, many of which may not now be navigable but may ultimately be made so, is controlled by the War Department. Previously, permission has been granted provided obstructions in the form of piers were reduced to a minimum and did not unduly impede channel navigation, and provided that a draw span was installed, or, in waters subject to continual navigation, provided the bridge was high enough to permit a clearance usually set at 135 feet. Apparently, the War Department was raising this requirement and had increased the minimum height from 160 to 200 feet.

The *Engineering News-Record* took issue with what it characterized as "the exorbitant demands

of the War Department for great clearance heights which threaten to place a prohibitive check on the construction of long-span bridges." The proposed New Orleans Bridge was one of several bridges that had been held up due to this desire on the part of the Army engineers to protect fully the interests of navigation.

Another, and even more important, general development was that leading toward public rather than private ownership of highway bridges. The new era of highway toll-bridge construction, which began three or four years previously, was marked by a return to the privately owned toll-bridge plan of earlier road days in America. This type of bridge had almost become a thing of the past but suddenly blossomed into new life. During the year 1929, the movement was subject to bitter attack and legislation. California definitely decided to finance and build her highway bridges as a State matter. Kentucky sold over \$10,000,000 in bonds for State-owned toll bridges. In West Virginia, a commission of three men was appointed to free all bridges both intrastate and interstate. With a change of administration in Louisiana, free State-owned ferries were put in operation on Lake Ponchartraine and the privately owned toll bridge recently completed was forced into the hands of receivers. The Louisiana State Highway Department were planning and expected to build important new bridges, including a \$17,000,000 structure over the Mississippi at Twelve-Mile Point, above New Orleans. It obviously was a bad year for private owners, and one great objection to State construction—the possibility that bridges might be built where and when politics, rather than economics, dictated—at least was partly removed by the spread of the income bond method of financing. Such bonds depend for interest on income from toll operation.

**TRUSS BRIDGES.** The simple truss continued to hold its own as a bridge type and several notable bridges of this form, including two important railroad bridges, were finished or were under way during the year.

**SUNSHAN BAY BRIDGE.** Contracts were let during the year for this railroad bridge over Sunshan Bay between Amoy Point and Jinsen, China. The Southern Pacific Railroad will use this \$12,000,000 structure to replace the old car ferry which had been in service for some 50 years. The bridge was to consist of seven broken upper chord, simple truss spans of 531 feet each and a lift span of 328 feet and would require several miles of approach grading to provide easy grades to the new structure. A notable feature of the design was the great height of the piers, some of which would reach a total height of 214 feet. All the piers were to be put down in large open reinforced concrete caissons, 40 by 60 feet in plan, which were to be sunk to rock. The plan was to sink these caissons within a sand-filled circular steel cylinder about 80 feet in diameter which will be gradually built up as it descends until it rests on the gravel or clay stratum overlying the bed rock. The caisson will be excavated through six dredging wells until it rests on rock. After the rock surface has been cleaned, some 35 feet of tremie concrete will then be placed in the bottom leaving some 100 feet of water which will be pumped out so that the piers may be built in the dry. This novel combination of the open dredging process and cofferdam-caisson construction will be watched with interest. Open con-

struction with a depth of 100 feet of water will set a new record for foundation work.

**LOUISVILLE, KY.** During the year 1929, the Cleveland, Cincinnati, Chicago & St. Louis Railway (Big Four) replaced the old Ohio River Bridge, designed for an E-30 loading and built between 1889-95, by a new work designed for an E-70, or 125 per cent greater, loading. The bridge consists of three simple broken upper chord truss spans of 547 feet each and the new trusses were erected around the old, which served to support the new work during erection and thus eliminated costly falsework.

**OHIO RIVER, PADUCAH, KY.** This bridge, seven simple truss spans of 390 feet and one of 716 feet, is the first highway bridge across the Ohio River from its mouth to Louisville and carries a concrete roadway 20 feet wide. The truss spans have inclined upper chords (the so-called broken-chord type) and the 716-foot span is probably the longest simple truss span ever built. A record was set in erecting the steel on this bridge and in spite of delays due to foundation difficulties the bridge was opened April 14. Steel erection began Sept. 6, 1928, and was completed Jan. 29, 1929, in two months less than schedule.

**FORT BELMONTAINE BRIDGE.** This highway toll structure consists of four 444-foot spans, with a 20-foot concrete roadway, supported on concrete piers. The trusses were erected by the modern methods of cantilevering out to intermediate falsework bents.

**JONITHA RIVER, INDIA.** The repair of this bridge on the Bengal Nagpur Railway was an interesting example of the fact that resourcefulness was still a fundamental quality in the engineer. The original spans were carried out by floods in 1927. Commencement was continued by patching together some old 60-foot girders and the new truss spans were put in place by utilizing these supports to slide the new trusses out from each end of the bridge to the centre pier. Falsework was thus unnecessary.

**CONTINUOUS TRUSSES.** This comparatively new form continued to be employed, a movement encouraged by a growing confidence in modern design methods, the substantial and solid character of modern pier construction, and the economies of this type of truss. The record truss spans of all time were held by the continuous truss—the greatest is Lindenthal's Scotoville Bridge over the Ohio with a truss 1550 feet long covering two spans of 775 feet each. The approach spans of the new Tacony-Palmira Bridge are half-through trusses of the same type and also illustrate the importance of this truss form in modern construction.

**OHIO RIVER AT CINCINNATI.** This bridge, which replaced an old railroad bridge of the Chesapeake & Ohio Railway to be remodeled into a toll highway bridge, is interesting because it is one of the longest continuous trusses ever built, 1575 feet, because silicon steel was used in its construction, and because it was erected by locomotive cranes. Having two side spans of 450 feet each and a centre span of 675 feet, the bridge was designed for an E-70 loading—that is, a locomotive carrying 70,000 pounds on each pair of driving wheels. The remarkable increase in bridge loadings in recent years is indicated by the fact that the old structure, built in 1880-88, was designed for an E-40 loading. The two side spans were erected on falsework and the centre span by cantilevering out from each side. Some

idea of the sizes involved in these modern continuous trusses is secured by noting that the truss was 105 feet deep over the main piers and that the locomotive cranes, which replaced the usual heavy-erection traveler, had to be rigged with 145-foot booms.

**MISSOURI RIVER.** Another notable continuous truss bridge was that over the Missouri River at St. Joseph, Mo. This bridge has two main spans of 450 feet and they are covered with a continuous truss 900 feet long. Silicon steel also was used in this work, and the truss had riveted connections throughout. The bridge was to be a toll-free highway structure built jointly by the city of St. Joseph and the State of Missouri.

**CANTILEVER BRIDGES.** In long span bridges, the field has been in general divided between the cantilever and the suspension types. Although suspension bridges have been built in greater numbers and size in recent years and the great Forth Cantilever is no longer the longest span in the world, not a year has passed without witnessing important cantilever projects. The Langview Bridge in the State of Washington over the Columbia River under construction would rank third in the world as to length of span, with 1200 feet between piers. The Montreal-South Shore cantilever would span 1097 feet, while the Cooper River cantilever (See FOUNDATIONS) would be of 1050 feet span. The Vicksburg and the Louisville bridges, although of smaller span, are notable works which show that the cantilever, although eclipsed in span by the suspension bridge, was still an important bridge type.

It is interesting to note that during the year a roadway was built over the famous Quebec cantilever, thus providing the only vehicular passage over the St. Lawrence below Montreal.

**ALONTEA SATURN BRIDGE.** This bridge, a 1097-foot cantilever span with two 420-foot anchor arms, is approached from the south by a long series consisting of 24 Warren-deck trusses varying from 90 to 240 feet. The work was completed as the year came to a close, the suspended span of the cantilever having been closed on July 16. This is a notable cantilever bridge, being, at the end of 1929, fifth in the world in length of span. It has a 37½-foot roadway with outside rapid transit tracks and foot walks. The clearance above the main channel, 500 feet wide, is 162 feet.

**VICKSBURG, MISS.** This bridge, the first to span the Mississippi River between Memphis and the Gulf (850 miles) is a private toll structure and was to provide an 18-foot highway and a single-track railway on the same level. The principal approach spans are simple trusses with spans of about 422 feet, but the channel is crossed with a cantilever of 825-foot span, with anchor arms of about 420 feet. Principal interest in the structure attaches to the pier construction. The swift current demanded special anchors for holding the caissons and timber mats to prevent scour, yet the foundations were carried down by pneumatic caissons to the remarkable depth of 110 feet (maximum ever reached by this method is slightly over 120 feet). Several of the caissons required air pressures of 52 pounds per square inch, which is about the maximum which it has been possible for workmen to endure.

**LOUISVILLE MUNICIPAL BRIDGE.** Another remarkable cantilever steel-truss bridge record was made in the construction of this \$4,750,000 bridge over the Ohio River at Louisville, Ky. The first

contract was awarded in June, 1928, and the bridge was opened Oct. 31, 1929. The main structure is 3740.5 feet long and includes two spans of 820 feet and two of 500 feet. It is a highway toll bridge financed by bonds issued by the city to cover the entire cost of the work, and it provides two roadways 38 feet wide and two 6-foot sidewalks.

**HABAHAN BRIDGE FIRE** In the days of timber bridges, the danger from fire was ever present and probably the majority of these bridges ended their lives in flames. It is unusual for fire to damage modern steel trusses, but a fire in the wood ties and floor of this 700-foot cantilever span in September, 1928, completely wrecked the floor system although the truss members escaped without much damage. Indeed, it was said that the floor system was so warped and twisted as to lose all resemblance to a floor system, while the trusses were not seriously damaged and repairs were completed without dismantling.

**STEEL ARCHES** It has become clearer, year by year, that Gustav Lindenthal established a new type in building the great Hell Gate Arch in 1917. In 1929 this form was introduced in Great Britain at Newcastle and two huge arches were placed under construction in Sydney, Australia, and in New York. Progress on these two great works was rapid and satisfactory, while several smaller bridges of the same type have been completed.

**KILL VAN KULI ARCH** The abutments of this 1075-foot highway toll structure, which was under construction by the Port of New York Authority, were rapidly completed, as foundation conditions were comparatively favorable and no pneumatic work of great magnitude was required. Erection of the arch ribs by cantilevering out to intermediate supports was in progress.

**SYDNEY ARCH** Satisfactory progress also was made in the erection of this great arch of 1650-foot span. The unusual abutment construction described in the 1928 Year Book was completed, thus permitting the erection of the steel arch to be carried out.

**McKEES ROCKS ARCH** Allegheny Co., Penn., began construction of a notable highway structure to connect McKees Rocks with the northern districts of Pittsburgh. The long approach on the McKees Rocks or west side of the river includes two tenticular arches of 304½-foot span over the railroad tracks, while the Ohio will be crossed by a single arch of the Hell-Gate type of 800-foot span. The Pittsburgh approach consists of three spandril-braced steel arches of 325 to 357½-foot span.

**LAKE CHAMPLAIN BRIDGE** The first highway bridge across this lake was opened August 26. It is interesting because it is the only highway structure in the 140-mile length of the lake and because of its foundations. The structure has a main steel-arch span of 434 feet, with deck-approach spans varying from 50 to 290 feet, built as continuous trusses over several spans. A channel clearance of 92 feet is provided. The notable deep-pier construction by open cofferdam was in connection with piers 6 and 7, those supporting the main span. The sites of these piers were dredged to 42.5 feet below water and a single row of spliced steel sheeting 98 feet long was driven inside a timber guide frame to form the cofferdam walls for piers 16 x 48 feet in size. Four sets of horizontal steel bracing were placed on the lake bottom inside the cofferdam and the

bracing for the upper portion of the cofferdam was hung in position from timbering at the top. As excavation with clamshell buckets proceeded, the lower braces dropped down. When the proper depth was reached, the top set of bracing was placed and hung in position by a diver, and excavation then went forward until the next level was attained, when the second set was set. In this way, the work proceeded until rock was reached at a maximum depth of 97 feet below water. The caissons were then filled to within 32.5 feet of water level by depositing concrete under water by means of a 1-yard bottom dump bucket. After this base had hardened, the upper portion of the cofferdam was pumped out and the pier construction continued in the dry. Apparently, no particular difficulty was experienced in this rather unique form of the well-known open-dredging foundation process.

**TACONY-PALMYRA BRIDGE** Crossing the Delaware River some 6 miles above the Philadelphia-Camden suspension bridge, completed in 1926, this new privately owned toll structure was opened on August 14—just 18½ months after work began. Three types of construction are comprised in its design. Two continuous half-through trusses of 743 and 748 feet in three spans each lead to the two central openings. One of these openings is crossed by a bowstring arch of 550-foot span and 64-foot clearance and the other by a rolling live bridge of the bascule type, affording a clear opening of 250 feet.

**WARSWORTH BRIDGE, SUNDERLAND, ENGLAND** The famous Sunderland Bridge, a cast-iron rib arch with a clear span of 236½ feet at last had to give way to a modern structure on this main east-coast British highway. The original bridge, one of the earliest examples of metal-bridge construction, was opened for traffic in 1796. Strengthened by Robert Stephenson in 1856 by making each pair of ribs into box girders by the addition of wrought-iron cover plates, the structure had a useful life of 134 years. The new bridge is a steel arch of 375-foot span, or 138½ feet longer than the old, and will permit a wider channel below, as well as somewhat greater clearance. The new bridge will be 79½ feet wide, as compared with 41 feet in the old structure, and will provide room for two tramway tracks.

**SUSPENSION BRIDGES** There was remarkable activity during the year in the erection of this type of bridge and an extraordinarily large number of this type were built. Many of these bridges are interesting either for span, novelty of design, or for the ingenious methods of construction which the great activity in this field has brought forward.

**HUDSON RIVER BRIDGE** During the year, the steel towers of this "greatest bridge in the world" were completed, as was also the huge concrete mass, 106,000 cubic yards, which forms the New York anchorage. The anchorage on the Jersey side is in deep shafts in the bed rock of the Palisades, and with these also completed cable operations were begun with a suitable ceremony on July 9th. At this time, the first cables, which support the footwalk and the apparatus for spinning the final bridge cables, were hoisted into position. Each of these footbridge cables, and there were two footbridges, one under each main cable, was supported by two groups of nine twisted-wire ropes about 3-inch in diameter. Each of these ropes was carried across on the

river bottom, and when the ends had been made fast to temporary anchorages, they were then hoisted simultaneously to the tower tops. It is interesting to note that these cables later were to be cut in suitable lengths to form the suspenders by means of which the bridge floor was to be hung from the main cables.

The spinning of the main cables began as soon as the footwalks, which were very rapidly erected, had been placed. As described in previous YEAR BOOKS, these cables were four in number, each consisting of 26,474 galvanized steel wires placed parallel to each other and bound into huge cables 36 inches in diameter. The individual wires are about  $\frac{1}{8}$  of an inch in diameter and 107,000 miles of this cold-drawn wire, more than enough to reach four times around the earth, were required for the work.

The operation for spinning these cables was carried out by special hauling ropes and spinning wheels by means of which 16 wires, four for each cable, were carried across the river over the footbridges simultaneously. Due to the open winter, some 12 per cent of the spinning work had been completed by the end of the year and the progress of about 2 per cent per week indicated that the cables would be completed by the autumn of

1930. At the end of 1929, contracts had not been let for the New York approach to the bridge with the arch crossing over Riverside Drive. These were to be awarded early in 1930 and it was hoped that the opening of the structure, set for 1932, would not be held up, due to the delay in connection with this important work.

THE MOUNT HOPE AND THE DETROIT BRIDGES. In the 1928 YEAR BOOK, the use of a new-process steel wire in two suspension bridges then under construction was noted as being of particular interest. Unfortunately, this heat-treated wire proved defective and in both cases had to be removed and replaced by the cold-drawn wire which has been in successful use for so many years. Fortunately, the defects of the new wire, although not discovered until the cables were completed and considerable progress had been made in erecting the steel work, were noted in time to save a collapse and possible loss of life. Very little was published in connection with the subsequent investigations of the cause of this wire failing, but it would appear that the heat-treatment process cannot be made thoroughly uniform in its results and that the wire, while having an exceptionally high tensile strength, is liable to be dangerously brittle.

The first of these two bridges was the Mount Hope suspension, connecting the island on which Newport, R. I., is located with the mainland; it was to have been opened about two months after the defect was discovered. So rapidly was the work of dismantling and reconstruction carried out, however, that the bridge, rebuilt with new cables, was opened on October 24. The other structure, the longest span (1850 feet) in the world until the completion of the Hudson River Bridge, was the Detroit International Bridge. Work on this bridge was not as far advanced as at Mt. Hope, when the cable construction was stopped, although the construction was one year ahead of schedule. Another record for rapid reconstruction was also made in this case and the bridge was opened in November, some nine months ahead of the original date set for completion. The Detroit Bridge at the end of 1929 was the longest span in the world—1850 feet or 50 feet longer than the previous record of the Quebec cantilever.

**CANYON CITY, COLORADO.** All doubt as to which is the highest bridge in the world was removed by the construction of a toll highway suspension bridge across Royal Gorge, near Canyon City, Colorado, 1050 feet above the bed of the Arkansas River.

**GALLIPOLI IS BRIDGE, OHIO.** This 700-foot span eyebar suspension bridge over the Ohio between Point Pleasant, West Virginia, and Gallipoli, Ohio, was the first of its type in the United States, although it was built on the same plan as the Florianopolis Bridge in Brazil, also designed by American engineers. As in this earlier bridge, which set the type, the Gallipoli Bridge utilizes the eyebar chain as top chord for part of the stiffening truss—to be exact, the entire half of the main span and the shore halves of the end spans. It should be noted that this truss has a variable depth, as in the earlier bridge, but that, unlike the Florianopolis Bridge, the end or backstay spans are loaded. Another bridge over the Ohio at St. Mary's West Virginia, was built to the same design as the Gallipoli suspension.

**GRAND-MERE BRIDGE, QUEBEC.** Another suspension bridge, in which wire rope was used for the cables instead of the usual method of spinning in place, is the highway toll span over the St. Maurice River at Grand-Mere, Quebec. This is the longest bridge of this type yet built, the main span being 949 feet. Each of the two main cables is built up of 32 galvanized steel wire ropes of 1½-inch diameter. Each rope contains 35 wires varying in size from 0.148 to 0.197 of an inch in diameter. These ropes were cut to the proper length and each end socketed. The bridge was erected during winter weather, so that the cable ropes could be supported on the ice on each side of the bridge. The socket ends for each rope were fastened to the anchorage connections, and the ropes were then lifted to their position in the cast steel saddles on the towers by sets of falls, hung from small A-frames on the tower tops. The 37 ropes making each cable were assembled in a hexagonal form and redwood strips, impregnated with linseed oil, were used to fill out this form into a circular section before the usual wrapping. The bridge has a half-through-section design, the truss and the back stays are unloaded.

**QUILMAN BRIDGE, ARGENTINA.** This structure, while the largest span built in the Argentine, is notable not for its size or carrying capacity, neither of which is extraordinary, but for two

unique features in its design. The suspension system consists of 32 separate spiral galvanized steel ropes, 16 on each side. Each of these ropes contains 169 wires of 0.173-inch diameter and is separately anchored. The ropes are not compacted to form a single round cable but are carried in a square form, 4 high and 4 wide, quite widely spaced by special hanger connections. The other unique feature is the continuous girder which bridges the three spans, 492 feet center and two 196-foot side spans, instead of the usual stiffening truss.

**TRI-BOROUGH BRIDGE, NEW YORK.** The Board of Estimate and Apportionment of New York City adopted a resolution directing the Department of Plant and Structures and the Board of Transportation to prepare plans for this bridge and for the Narrows Tunnel. The committee also was authorized to issue corporation stock and serial bonds to cover the cost of the work which is estimated at \$100,000,000. The plans called for a suspension span over Hell Gate, near the Hell Gate Arch, with a long viaduct over Ward's and Randall's islands. The main span was to be 1380 feet and steel arches were planned for crossing the Little Hell Gate and Bronx Kills. A cross line was planned to connect the center of the viaduct, opposite 125th Street, to Manhattan Island over the Harlem River. The total length of the structure was designed for 17,710 feet, of which 4318 feet was to be bridge construction and remainder viaduct or masonry arches.

**TOLEDO, OHIO.** Contracts were awarded for a 785-foot wire cable span over the Maumee River at Toledo, Ohio. A 51-foot roadway is provided.

**THE SELF-ANCHORED SUSPENSION BRIDGE.** One of the earliest examples of this type of suspension is the 605-foot span over the Rhine at Cologne, built during the World War in 1915. The scheme consists in making the stiffening truss continuous and designing it to serve as a compression member. Thus, the ends of the cables are carried out until their slope becomes very small. They are almost horizontal, and are attached to the ends of the stiffening truss and floor system. The cable pull is thus taken by compression in the floor and stiffening truss instead of the usual anchorage. Indeed, it might almost be proper to describe such a bridge as a suspension-cantilever. There are obvious advantages for this type for moderate spans where anchorage construction is difficult. Eyebars are the usual form due to the fact that they permit an economy of material in the suspension system where the stress is not uniform.

There were three bridges of this type over the Allegheny River at Pittsburgh and the last bridge, at Sixth Street, erected in 1928, was recently awarded the prize of the Institute of Steel Construction as the most beautiful bridge of the year.

**KYUSO BRIDGE, JAPAN.** While a comparatively small structure—the main span is only 300 feet—this bridge over the Sumida River at Tokyo, Japan, is of special interest because it is a Japanese product and is novel in design. The bridge is of the type known as a self-anchored suspension—the usual stiffening truss being replaced by box girders capable of taking the compression due to the cable pull. Instead of the usual wire or eyebar suspension members, flat Dual steel plates were used, cut in eyebar form. The special manganese steel for these plate-chains could be made in Japan, whereas suitable fac-

ities were not available for the other types of suspension mentioned.

**MOVABLE BRIDGES.** An important decision was handed down by the U S Circuit Court of Appeals at San Francisco in the series of law suits which had been in progress for some eight years between the City of Seattle, Wash., and the Strauss Bascule Bridge Company. A decision at Chicago was in favor of the bridge company, and the City of Seattle decided to settle its first case out of court as being probably the least expensive procedure. Subsequently, the city engineers developed a non-infringing design. It would now appear that the basic patent of the Strauss Company was invalid. Curiously enough, the principle of the transverse support by means of a transverse cross-girder in the trunion type of bascule lift was found to have been applied as early as 1871 in the construction of two large precision scales which had been in use for over 50 years for weighing bullion in the United States Mint in San Francisco. This discovery probably meant that another of the few valid patents in structural design would be invalidated.

**NEWARK BAY BRIDGE.** A remarkable accident marred the erection of this long trestle and lift bridge being built over Newark Bay for the Pennsylvania and Lehigh Valley railroads. On April 1, during a heavy windstorm, the lift span fell from its falsework supports. The span suffered little damage and was recovered and used with only minor repairs.

**JACKSONACK BASCULE BRIDGE COLLAPSE.** An investigation of the causes of failure on Dec. 15, 1928, of the east half of the two-leaf draw span over the Jacksonack River on the Lincoln Highway near Jersey City, N. J., showed that the supports for the concrete counterweight were inadequate. The steel work of the north counterweight tower failed and permitted the counterweight to fall over toward the river and thus wreck the east span of the bridge. The failure attracted considerable attention and the report of the engineers who investigated showed that the designers had failed to provide sufficient strength to meet the loads involved.

**THE STONE ARCH STILL SURVIVES.** There has been a wide gap in connecting lines between the French Midi Railway, crossing from the Atlantic to the Mediterranean just north of the Pyrenees, and the Spanish lines just south of the barrier. Construction of two new transpyrenean links has been under way for some years. The Canfranc line, to be opened in 1930, involves both a remarkable helioidal tunnel and a stone-arch bridge of notable dimension. The bridge with a main span of 137  $\frac{1}{2}$  feet is, of course, not a record structure, but it shows clearly that, whereas cut-stone bridges in many sections of the world, notably America, are apparently things of the past, in certain localities, lower labor costs may make them economic structures and representative of the best engineering practice. In this connection, the Canfranc tunnel on the same line, 1170 feet long and consisting of masonry arches, is reminiscent of railroad and canal work in Great Britain a century ago.

**CONCRETE ARCHES.** Considerable attention was attracted by the results to date in a comprehensive series of measurements of existing concrete-arch bridges and other studies being carried out by a committee of the American Society of Civil Engineers. Temperature stresses, effect of pier deformations and many other important

considerations in the action of these bridges were under investigation. American engineers have been somewhat behind their European competitors in building slender and graceful long-span arches; they had concentrated on the more solid and massive viaduct type of bridge. The results of this new study will undoubtedly have an important effect on the design and future of concrete-arch construction in America.

In the meantime, attention is focused on the remarkable arch bridge under construction at Brest, France—the longest concrete arch in the world.

**THE PLOUGASTEL-BREST BRIDGE, FRANCE.** All concrete-arch spans were to be exceeded by this remarkable bridge, proposals for which have been noted in previous YEAR BOOKS, under construction in 1929 over the Elorn River between Plougastel and Brest, France. It differs in so many ways, both in design and construction, from American work that it is of particular interest from this standpoint, as well as the mere matter of size. Its three arches of 612-foot span are of box or cellular form, the section consisting of an upper and lower slab connected by four vertical walls, the outer of which constitutes the arch faces. This type of construction has been widely used in Europe but has not received attention in America, where concrete is employed in more massive and heavier forms. The arches support a deck of two stories, the lower of which carries a single track railway and the upper a roadway 26 feet wide. The arches have a width of 31  $\frac{1}{2}$  feet, a maximum depth of 16  $\frac{1}{2}$  feet, and the walls reach a maximum thickness of about 3 feet. Over the centre of the span, the extrados, or upper, slab of the arch is omitted in the centre cell, so as to permit the passage of the railway floor between the two side cells. A very rich concrete was used in the arch construction (19 barrels of Portland cement per cubic yard) and it was expected that the concrete would attain a strength of 8500 pounds per square inch by the time the bridge was to be in service—late in 1930. (American practice would consider a 5000-pound concrete about the limit in possible strength.) Reinforcing is used only for secondary stresses.

In construction, this bridge is no less novel and interesting than in these features of design. A concrete caisson was constructed which was used as a diving bell in constructing the first of the two river piers and was then removed and used in the normal manner for the second pier. The first pier was in relatively shallow water and the inside dimensions of the working chamber of the caisson were made to conform to the pier dimensions. When rock had been reached, the caisson was raised simultaneously with the placing of the concrete and was finally lifted off the completed base with compressed air.

The lower sections of the arch ring were built by cantilevering out from the pier. A huge arch centre, an interesting combination of concrete and timber, was used in succession for each of the three arches. This huge centre, itself a great arch, was floated into position by using horizontal ties to take the thrust and supporting each end on a barge. When in place, it was lifted by jacks into final position and concreting operations began. A special and novel cableway was used to convey the concrete from the shore plant to the work and to unload materials.

This work was described as "daring, courageous, and bold," and as offering "a new con-

ception of concrete as a structural material." It is certain that American engineers would never have used concrete for such a bridge, and it remains to be seen whether this work will actually mark a new era in concrete-bridge construction or whether it is merely another *four de force* of the French engineering genius, remarkable, unique, and novel, but not the forerunner of a new bridge development.

**COLUMBIA VIADUCT** The widespread use in America of concrete in a more substantial and conservative form is well illustrated by this huge bridge viaduct which is to cross the Susquehanna River between Columbia and Wrightville, Pa. Quite an important link on the Lincoln Highway, this four-lane concrete toll bridge will have a total length of 7400 feet. It consists of no less than 28 concrete arches of 185-foot span each and totaling 5532 feet. Work on this bridge was under way in 1929.

**MOUNT PLEASANT RIGID-FRAME BRIDGE** The very successful and economical reinforced concrete bridges of the Bronx and Westchester County Park Commissions have been noted in earlier YEAR BOOKS. These progressive commissions have now translated this same type of bridge into steel construction. The pioneer of this new type of bridge is a span of 100 feet which carries the Bronx Parkway extension over the Harlem division of the New York Central Railroad about 2 miles north of Valhalla, N. Y. It was claimed by the designing engineer, A. G. Hayden, who applied this type of bridge to the work of the commission, that the transition from reinforced concrete to structural steel presented no difficulties and made it feasible to construct economically, rigid-frame bridges of longer span. The design in this bridge consists of five rigid-frame steel girders of inverted U-form and is complicated by the fact that the bridge is a skew span of 45 degrees skew. See also FOUNDATIONS.

**BRIGHAM YOUNG UNIVERSITY** A co-educational institution in Provo, Utah, founded in 1875 and maintained under the auspices of the Church of Jesus Christ of Latter-day Saints. It comprises a graduate school, colleges of arts and sciences, education, commerce, applied science, fine arts, and a division of research and extension. In the 1929 summer session, 470 students were enrolled, the autumn-session enrollment was 1278. The faculty numbered 106 members. The library contained 60,000 volumes and 50,000 pamphlets. The budget for the year was \$478,000. President, Franklin Stewart Halliue, Ph.D.

**BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.** An association founded in 1831 in York, England, incorporated by Royal Charter in 1928, and composed of 13 sections representing all branches of pure and applied science. The annual meeting for 1929, which was held from July 22 to 27 in Cape Town, South Africa, and from July 27 to August 3 in Johannesburg and Pretoria, was one of the most important of scientific meetings ever held south of the Equator. About 1750 delegates were present, 600 of whom were from different parts of the British Empire and from the United States. This was the seventh meeting of the association to be held outside the British Isles, the previous ones having been held in Montreal, Canada, in 1884, in Toronto, Canada, in 1897, in Cape Town, South Africa, in 1905, in Winnipeg,

Canada, in 1909; in Melbourne and Sydney, Australia, in 1914, and in Toronto, Canada, in 1924.

Sir Thomas Holland, British geologist and rector of the Imperial College of Science, was installed as president of the association at the opening session of the meeting on July 22. The precedent whereby the proceedings were opened with the address of the president was waived, however, in order to allow Dr. Jan H. Hofmeyr, president of the South African Association for the Advancement of Science, to welcome the delegates and to review in his address, "Africa and Science," the progress of learning and the benefits of science since the previous meeting of the association in South Africa in 1905. At the conclusion of his address Dr. Hofmeyr presented the South Africa Research Medal (founded in commemoration of the 1905 meeting) to Dr. Robert Broom, the South African paleontologist.

The sessions, while not lacking in specialized discussions of the highest interest, were appropriately predominated by the idea of empire, Sir Thomas Holland setting the example by choosing as the subject of his paper, "The International Relationship of Minerals." The presidential addresses to the sections were as follows: Lord Rutherford, Section A (Mathematics and Physics), "Some Problems of Cosmical Physics, Solved and Unsolved"; Prof. George Barger, Section B (Chemistry), on "The Relation of Organic Chemistry to Biology"; Sir Albert E. Kitson, Section C (Geology), on "The Utility of Geological Surveys to Colonies and Protectorates of the British Empire"; Prof. D. M. S. Watson, Section D (Zoology), on "Adaptation"; Brig. E. M. Jack, Section E (Geography), on "National Surveys"; Prof. Henry Clay, Section F (Economic Science and Statistics), on "Public Regulation of Wages"; Prof. F. C. Low, Section G (Engineering), on "Science and Engineering"; Prof. Henry Bailour, Section H (Anthropology), on "South Africa's Contribution to Prehistoric Archaeology"; Prof. W. E. Dixon, Section I (Physiology), on "The History of Treatment in Disease since the Mid-nineteenth Century"; Prof. F. C. Bartlett, Section J (Psychology), on "Experimental Method in Psychology"; Prof. Albert C. Seward, Section K (Botany), on "Botanical Records of the Rocks"; Dr. C. W. Kimmins, Section L (Education), on "Modern Movements in Education"; and Sir Robert Greig, Section M (Agriculture), on "Agriculture and the Empire." An important feature of the section meetings was the joint discussion by Sections D, I, and K (Zoology, Physiology, and Botany) on "The Nature of Life." The discussion was opened by the Rt. Hon. Jan C. Smuts, who presented his theory of "Holism," a philosophic conception, based on the observed tendency of the universe to form wholes, which the statesman first made public in a book of that title published in 1927. See ZOOLOGY.

Other important addresses were given by Prof. A. S. Eddington on "The Interior of a Star," by Sir Ernest Rutherford on "The Structure of the Atom," and by Prof. Julian Huxley on "Evolution." At one of the astronomical sessions, Dr. W. J. Luyten of the South African station of the Harvard University Observatory described his researches on the newly-discovered 70-ton meteorite in South Africa.

It was announced that the 1930 meeting would convene in Bristol, England, at which time the

president-elect, Prof. F. O. Bower, Sc.D., LL.D., F.R.S., was to be installed. Other officers elected at the 1929 South African meeting were General secretaries, Dr. F. E. Smith, C.B., F.R.S., and Prof. J. L. Myers, O.B.E.; general treasurer, Sir Josiah Stamp, G.B.E., secretary, O. J. R. Howarth, O.B.E., and honorary curator of Down House (the home of Charles Darwin recently acquired by the association and maintained as a national memorial), G. Buckton Browne, F.R.C.S. It also was resolved that the centenary meeting in 1931 should be held in London from September 23 to 30. Headquarters of the association are in Burlington House, London, W. 1, England.

**BRITISH COLUMBIA.** A Canadian province on the Pacific Ocean, lying between Alaska, the province of Alberta, and the State of Washington. Area, 355,855 square miles. Capital, Victoria.

The population, according to the census of 1921 was 524,582, as compared with 392,480 in 1911. The census bureau estimate in 1928 was 583,000, including 25,000 native Indians. The principal cities, with their populations in 1921 were Victoria, 37,728 (estimated 1929, 67,000), Vancouver, 117,217 (estimated 1929, 300,000), New Westminster, 14,495 (estimated 1929, 18,000). The movement of population in 1927 was Births, 9982, deaths, 5736, marriages, 4781. There is a complete system of free and nonsectarian education, ranging from primary to collegiate instruction. In 1927 there were 1008 elementary schools with 3062 teachers and 91,155 pupils and 78 high schools, with 419 teachers and an enrollment of 13,412 pupils. The Provincial University had 1741 students in 1927-28.

The area of the timber land of British Columbia, estimated at more than 100,000,000 acres, contained roughly 400,000,000 feet of merchantable timber. The value of forest products in 1928 was \$93,787,000, or 13 per cent more than in 1927, when the output was valued at \$83,087,000. Mineral resources are abundant, the value of minerals produced in 1928 totaling \$65,372,582. The estimated production for 1929 was \$70,030,976, a new record for the province. In 1928 copper led all minerals in the value of output, with lead, coal, zinc, silver, gold, and structural materials following in the order named. Coal production totaled 2,526,702 tons and was valued at \$12,633,510. The aggregate forest, mineral, farm, and fisheries production in 1929 was estimated at \$244,000,000, an increase of \$2,000,000 over 1928. Estimated production of the respective industries was Lumbering, \$90,000,000, mining, \$70,000,000, farming, \$63,000,000, and fisheries, \$21,000,000.

The value of field crops produced in 1928 was \$18,465,000 and the value of all agricultural products, \$50,715,000. The fish catch in 1927 amounted to \$23,227,904. For other figures pertaining to agriculture and to manufacturing, see CANADA.

For the fiscal year ending in 1927, the revenues totaled \$20,257,916 and the expenditures \$19,408,881, including sinking funds taken from capital expenditures. The 1929-30 estimates of revenue and expenditure amounted to \$25,000,000. The gross funded debt on Sept. 1, 1928, was \$84,191,130 and the net debt, \$49,543,778. The government is under a lieutenant-governor and a legislative assembly of 48 members elected for five years. The province is represented in the Dominion Parliament by 6 members in the Senate and 14 members in the House of Commons. Lieu-

tenant-Governor in 1929, Robert R. Bruce, Prime Minister and Minister of Railways, S. F. Tolmie, Provincial Secretary and Commissioner of Fisheries, S. L. Howe, Attorney-General, R. H. Pooley, Minister of Lands, F. P. Burden, Minister of Finance and of Industries, W. C. Shelly, Minister of Agriculture, William Atkinson, Minister of Mines and of Labor, W. A. McKenzie, Minister of Public works, N. S. Loughheed, Minister of Education, J. Hinchliffe, President of the Council, R. W. Bruhn, Minister without Portfolio, R. L. Maitland.

**BRITISH EAST AFRICA.** A British possession covering a large area of Africa, and comprising KENYA COLONY, UGANDA PROTECTORATE, and ZANZIBAR. See these articles.

**BRITISH EMPIRE.** An empire consisting of (1) GREAT BRITAIN AND NORTHERN IRELAND, CHANNEL ISLANDS, and ISLE OF MAN, (2) THE IRISH FREE STATE, INDIA, and the various British Dominions, Colonies, Protectorates, and Dependencies. See these articles.

**BRITISH GUIANA,** ge-a'-na A British colony on the northern coast of South America, including the settlements of Berbice, Demerara, and Essequibo, bounded on the north by the Atlantic Ocean, on the east by Dutch Guiana, on the south by Brazil, and on the west by Venezuela. Area, 89,480 square miles, population, according to the census of 1921, 207,091, excluding about 9700 aborigines in the remoter districts. An official estimate of the population in 1927 placed it at 308,473, including 127,017 East Indians. In the same year, the movement of population was Births, 10,041, deaths, 8024. The capital is Georgetown, with a population of 57,416. The chief pursuit is agriculture and the principal products are sugar (114,030 tons in 1927), rice (35,310 tons in 1927), and coconuts (22,113,000 units, 1927). Stock raising is of some importance. The number of live-stock in 1927 was 141,146 cattle, 4055 horses, 24,060 sheep, 19,784 goats, 18,070 swine, 8603 donkeys. The mineral resources are considerable, gold, rough diamonds, and bauxite being found in large quantities. The principal exports are sugar, rough diamonds, balata, charcoal, rice, timber, and rum, and the chief imports are flour, fertilizers, machinery and hardware, tobacco, foodstuffs, and textiles. Statistics on revenue, expenditure, and trade for 1926 and 1927 follow.

	1926 £	1927 £
Revenue	1,054,127	1,068,865
Expenditure	1,173,491	1,148,028
Imports	2,728,746	2,657,265
Exports	2,863,923	4,625,374

In 1927, 2747 vessels with a total tonnage of 1,138,493 entered and cleared the ports of British Guiana. Practically all the vessels were British, Norwegian, and Dutch. There are 97 miles of railroads. The colony is administered by a governor, assisted by a court of policy, consisting of seven official members and eight elected members, and a combined court, containing in addition to the above, six financial members elected by the registered voters. Governor in 1929, Brigadier General Sir Gordon Guggisberg (appointed August 1928).

**BRITISH HONDURAS,** hon-doo'-ras A British Crown colony on the Caribbean coast of Central America, east of Guatemala, and 700 miles

west of Jamaica. Area, 8598 square miles; population, according to the census of 1921, 45,317, estimated, Jan 1, 1928, 49,249 Chief town Belize (population, 1921, 12,601).

The movement of population in 1927 was Birth rate, 36.42 per thousand, death rate, 22.02 per thousand, marriages, 414 In 1927 there were 73 primary schools with an enrollment of 7527 The chief pursuits are agriculture and forestry although only a small part of the land is cultivated In the higher lands, good pasturage is to be found

The chief exports are bananas, mahogany, cedar, and other forest products, plantains, coconuts, and cacao The chief imports are clothing, cotton and silk goods, milk, flour, machinery, and hardware The United States leads all other countries in respect both to imports and exports The value of imports in 1927 was \$4,534,804, exports, \$4,547,528 Government revenues in 1927 totaled \$4,534,792, and expenditures, \$4,547,526 The public debt stood at \$1,587,567 in 1927-28 The tonnage entered in 1927 totaled 341,063 tons There are 25 miles of railway Wireless communication is maintained with New Orleans and Jamaica, 6183 radio telegrams being transmitted in 1927 The administration is under a governor assisted by an executive council of six members and a legislative council of six official and seven unofficial members Governor and Commander-in-Chief in 1929, Sir J. A. Burdon

**BRITISH INDIA.** See INDIA, BRITISH

**BRITISH NEW GUINEA.** See PAPUA

**BRITISH NORTH BORNEO** A British colony, comprising the northern part of the island of Borneo Area, about 31,106 square miles, population, at the census of 1921, 257,804, most of whom were Mohammedan settlers in the coast regions and aborigines in the interior, the Europeans numbering only 533 The most numerous tribes were the Dusuns (112,287), Muruts (37,447), and the Bajaus (33,070) The chief towns are Sandakan, with a population of 11,936 on the east coast, and Jesselton, on the west coast Only a small part of the soil is arable The principal products are timber, coconuts, rice, sago, gum, coffee, fruits, spices, gutta-percha, camphor, rattans and other forest products, and tobacco Coal, iron, gold, and mineral oils also are to be found to some extent The trade is chiefly carried on with Great Britain almost entirely through the ports of Hong Kong and Singapore The principal exports in 1927 were leaf tobacco, £180,574, rubber, £1,088,494, timber, £211,782 There is a railway 127 miles long running from Jesselton to Melalap, with a branch to Brunei Bay Statistics of finance and trade for 1926 and 1927 were

	1926	1927
	£	£
Revenue	434,396	454,588
Expenditure	273,119	256,440
Imports	970,319	1,224,705
Exports	1,987,233	1,978,596

The tonnage entering in 1927 was 305,733, cleared, 362,364 tons The territory is under the jurisdiction of the British North Borneo Company and the administrative functions are exercised by a governor in Borneo and a board of directors in London Governor in 1929, J. L. Humphreys.

**BRITISH SOMALILAND.** See SOMALILAND, BRITISH

**BRITISH SOUTH AFRICA.** See SOUTH AFRICA, BRITISH

**BRITISH TRADES-UNION CONGRESS.** See TRADE UNIONS

**BRITISH WEST AFRICA.** The general name given to the following British colonies in West Africa, Nigeria (colony and protectorate), Gold Coast (comprising the Gold Coast colony, Ashanti, and the Northern Territories), Sierra Leone (colony and protectorate) See separate articles

**BRITISH WEST INDIES.** A number of scattered island possessions of the British Empire in the West Indies, including (1) the Bahamas, (2) Jamaica and small adjacent islands, and (3) the islands along the east of the Caribbean Sea and near the coast of South America, including the Leeward group, the Windward group, Trinidad, Tobago, and Barbados See under separate articles

**BROADCASTING.** See RADIO COMMUNICATION

**BRODSKY, ADOLF** A famous British violinist, died in Manchester, Jan 22, 1929 He was born in Taganrog, Russia, Mar 21, 1851 From 1860 to 1866, he studied at the Vienna Conservatory under J. Hellmesberger and for two years (1868-70) was a violinist in the orchestra of the Hofoper After further study with Laub, in Moscow, he succeeded the latter as professor of violin at the conservatory there In 1879 he went to Kiev as conductor of the symphony concerts His career as a virtuoso began in 1881, when he won emphatic success on tours of Austria, France, and England In Vienna, in 1882, he created a sensation at a Philharmonic concert by the first public performance of Tchaikovsky's great violin concerto In the same year, he performed that work, by request, in practically all the important cities of Germany In 1883 he was appointed professor of violin at the Leipzig Conservatory There, he established his own quartet (Brodsky, H. Becker, A. Nuvaek, J. Klengel), which on its extended tours of Europe soon won international reputation During 1891-94 he was concert master of the New York Symphony Orchestra and toured the United States and Canada as soloist After further tours of Germany and Russia, he settled definitely, in 1895, as concert master of the Hallé Orchestra and professor of violin at the Royal College of Music at Manchester Three months after entering upon these duties, Sir Charles Hallé died and Brodsky succeeded him as director of the Royal College, a position which he filled with distinction until his death In Manchester, he also formed a new string quartet (with Briggs, Speelman, and Fuchs), which was scarcely inferior to his famous Leipzig quartet, but did not become so widely known, because his duties as concert master and director did not permit extended tours Brodsky's playing was noted for power and beauty of tone and unusual grandeur of conception

**BROKERS' LOANS.** See BANKS AND BANKING

**BROOKINGS INSTITUTION** An association established in 1927, in Washington, as the outgrowth of experimentation in research and training conducted there for some years by the Institute of Economics, the Institute for Government Research, and the Robert Brookings Grad-

uate School of Economics and Government The institution is an amalgamation of these three agencies and is designed to cover eventually the entire range of social sciences, as well as to provide facilities for advanced research training in such subjects as economics, government administration, political relations, history, law, and social organization It affords an opportunity for young graduate scholars to spend from one to three years in a well-equipped research organization In addition, it provides headquarters for visiting scholars from the United States and foreign countries, who come to the national capital to make use of the great amount of material available there on economic, political, historic, social, administrative, and legal problems, as found in the records of the various departments of the Government

The institution is supported from endowment funds and annual grants By charter provision, the investigations are conducted "without regard to the special interests of any group in the body politic, whether political, social, or economic" The board of trustees, a self-perpetuating body, has general responsibility for determining the institution's policies of work, but does not assume each particular investigation, its position in this respect being defined as follows "The primary function of the trustees is not to express their views upon the scientific investigations conducted by any division of the institution but only to make it possible for such scientific work to be done under the most favorable auspices" The institution publishes the results of its own research work The officers of the board of trustees for 1929-30 were (Chairman, Robert S Brookings, the founder of the institution, vice chairman, Leo S Rowe, treasurer, Frederic A Delano, president, Harold G Moulton Headquarters are at 26 Jackson Place, Washington, D C

**BROOKLYN INSTITUTE OF ARTS AND SCIENCES.** An institution in Brooklyn, N Y, composed of three divisions—education, museum of arts and sciences, and a botanic garden It was founded in 1824 and incorporated in its present form in 1890 Membership is open to all who are interested in any branch of science or art The educational division is divided into the following departments, composed of members interested in a particular field Agriculture, astronomy, botany, dramatic art, electricity, fine arts, geography, geology, home economics, music, pedagogy, philology, philosophy, photography, physics, political science, psychology, and sociology These departments conduct courses and sponsor addresses, lectures, and concerts A forum conducted by the departments of political science and sociology provides for the discussion of current problems The enrollment in the school of pedagogy in 1929 was 1700, with an attendance at lectures of 283,580 The institute's museum contains collections in the fields of art, ethnology, and natural science, its botanic garden comprises more than 50 acres Attendance at the museum during the year was 500,054 and at the botanic garden, 1,127,475 The library contained more than 26,000 volumes In 1929 the permanent funds of the institute amounted to \$2,693,367, the funds to meet current expenses totaled \$808,000 The president of the board of trustees was Edward C Blum, director of the division of education, Charles D Atkins, of the museum of arts and sciences, Wil-

liam Henry Fox, and of the botanic garden, C Stuart Gager Headquarters are at the Brooklyn Academy of Music, 30 Lafayette Avenue, Brooklyn, N Y

**BROWN UNIVERSITY** An institution of higher education in Providence, R I, founded in 1764 In the autumn of 1919, the enrollment was 2205, of whom 290 were graduate students, 1358, undergraduate men, including 252 seniors, 339 juniors, 355 sophomores, 389 freshmen, and 23 specials, 499, undergraduate women, and 58, school of education students The faculty of 202 members included 109 professors, 43 instructors, and 50 assistants Among the new appointees were Arthur Mangun Banta, acting professor of biology, on leave of absence from the Carnegie Institution, William Albert Noyes, Jr, associate professor of chemistry, and Willard C Beatty and Chelene C Bosland, assistant professors of economics The permanent productive funds of the university amounted to \$9,717,071, of which \$9,222,519 was an endowment of the men's college and \$494,551, an endowment of the women's college, the total income from these funds was \$495,501 The library contained 350,000 volumes In October, 1928, the university corporation voted that the name of the women's college be changed to that of Pembroke College in Brown University Dr William H P Faunce was elected president emeritus in June, 1929, and Oct 17, 1929, Clarence Augustus Barbour, D D, S T D, LL D, former president of Colgate Rochester Divinity School, was inaugurated as president

**BRUNEL, BRUNĒ** A British region on the northwestern coast of the island of Borneo Area, about 2500 square miles, population, according to the census of 1921, 25,444, of whom the Europeans numbered only 35, the bulk of the population being made up of Malays and native Borneans Sultan in 1929, Ahmed Tajudin Akhazul Khan Wudim, a minor, who succeeded his father in September, 1924, and is assisted by a regency Brunel is the chief town, with a population of about 12,000 Among the principal products may be mentioned mangrove extract, rubber, coal, sago, and jelutong Cloth weaving, silverware, brass founding, and boat building are found among the native industries In 1927 the chief exports were gutta, rubber, jelutong, and forest products, the chief imports, rice, tobacco, kerosene oil, machinery, piece goods, and sugar The revenue in 1927 was £46,916, expenditures, £49,816, public debt, Jan 1, 1928, £48,883 The administration is in the hands of a British Resident, the sultan retaining the name only and with his two principal ministers receiving a subsidy from the British government British Resident in 1929, P A B McKernon

**BRUSH, CHARLES FRANCIS** American inventor and pioneer in the electrical industry, died in Cleveland, Ohio, June 15, 1929 He was born in Fuedia, Ohio, May 17, 1849, and received scientific degrees from Michigan and Western Reserve universities From 1870 to 1873, he was an analytical chemist in Cleveland Becoming interested in electricity, he designed a dynamo in 1876, and in 1878 he developed his arc lighting system His numerous later inventions were outgrowths of these In 1881 he founded the Brush

Electric Company, which was absorbed by the General Electric Company. He was made a Chevalier of the Legion of Honor by the French government in 1881, he received from the American Academy of Arts and Sciences the Rumford Medal for the practical development of electric arc lighting, he received in 1913 the Edison Medal from the American Institute of Electrical Engineers, and in 1928 he was given the Franklin Medal by the Franklin Institute of Philadelphia. Shortly before Mr. Brush's death, plans were announced for the establishment of the Charles F. Brush Foundation for the Betterment of the Human Race, a memorial to his son, Charles F. Brush, Jr.

**BYRN MAWE COLLEGE** An institution for the higher education of women in Bryn Mawr, Pa., founded in 1880. The enrollment for the autumn of 1929 totaled 516, distributed as follows: Seniors, 91, juniors, 82, sophomores, 115, freshmen, 123, resident fellows, 20, graduate students, 82, heaters, 3. The teaching staff numbered 82. The productive funds of the college amounted to \$6,481,000 in the autumn of 1929, and the income for the year 1928-29 was \$1,062,075. The number of volumes in the library was 127,000. President, Marion Edwards Park, Ph.D., LL.D.

**BUCKNELL UNIVERSITY** A coeducational Baptist institution of higher learning in Lewisburg, Pa., founded in 1846 under the name of University of Lewisburg but renamed in 1886 in honor of its benefactor, William Bucknell. In the autumn of 1929, the enrollment was 1163, of whom 743 were men and 420 women. Of the 400 students enrolled in the summer session of 1929, 185 were men and 215 were women. The faculty numbered 71. The productive funds amounted to \$1,700,000 and the income for the year was \$675,000. Courses were offered in liberal arts, biology, education, commerce and finance, music, and engineering. The library contained 55,000 bound volumes. President, Emory W. Hunt, D.D., LL.D., D.C.L.

**BUCKWHEAT.** The buckwheat production of the United States in 1929 was placed by the Department of Agriculture at 11,505,000 bushels as compared with 13,148,000 bushels produced the year before and 13,949,000 bushels, the average production of the preceding five years. The acreage dropped from 749,000 acres in 1928 to 729,000 acres in 1929, this decrease of about 3 per cent being due to smaller acreages in several of the less important buckwheat producing States. The average yield per acre was reported at 15.8 bushels, or about 10 per cent below the 1928 average of 17.6 bushels. Farm prices, as of December 1, averaged 97.7 cents per bushel in 1929 and 87.5 cents in 1928, giving total values of \$11,241,000 the past year and \$11,511,000 for the preceding crop. The yields produced in the buckwheat growing States were estimated as follows: Pennsylvania, 3,383,000 bushels, New York, 3,168,000, Minnesota, 812,000, West Virginia, 760,000, Ohio, 673,000, and Michigan, 405,000. Michigan lost its usual rank in 1929 due mainly to a marked reduction in average yield per acre, the result of a drouthy season.

The average yield per acre in the 23 States reporting buckwheat production, extending from Maine to North Carolina and Tennessee, and westward to the Dakotas and Nebraska, ranged from 6 bushels in North Dakota to 28 bushels in

in Maine and the average price paid farmers on December 1, from 73 cents per bushel in North Dakota to \$1.10 per bushel in Vermont, West Virginia, and Tennessee. During the year ended June 30, 1929, the United States exported 229,000 bushels of buckwheat and imported 3,633,000 pounds. As buckwheat is easily threshed, the crop may be harvested with the combined harvester and thresher with but slight loss. The grain or kernel is easily cracked, however, and proper adjustment of the machine, especially as to cylinder speed, is necessary.

**BUFFALO.** THE UNIVERSITY OF A coeducational institution of higher learning in Buffalo, N. Y., founded in 1846 under a charter received from the State Legislature. The enrollment for the autumn of 1929 was 3237, distributed as follows: College of arts and sciences, 771, school of law, 205, school of dentistry, 122, school of medicine, 285, school of pharmacy, 182, school of business administration, 142, evening session, 1530. The enrollment for the 1929 summer session was 877. The faculty numbered 420, including 42 new appointees. In 1929 an endowment fund campaign was completed, the contributions received amounting to more than \$5,000,000. The income for the year 1928-29, exclusive of gifts, amounted to \$818,683. The library contained 69,683 volumes and 25,000 pamphlets. President, Samuel P. Capen, Ph.D., LL.D., Sc.D., LL.D.

**BUILDING.** According to *Bradstreet's* annual summary of building expenditures, as shown in permits issued during the year, the total value of the buildings permitted for 215 cities of the United States for the calendar year 1929 was \$2,913,384,758, a decrease from \$3,304,507,092 in 1928, or 11.8 per cent. At the peak year, 1925, these expenditures were placed at \$3,883,172,225, so that there was a decrease in 1929 of 24.9 per cent. *Bradstreet's* summary of building expenditures of all cities reported since 1918 was as follows:

Year	Total	Change yearly, per cent
1929	\$2,913,384,758	Dec 11.8
1928	3,304,507,092	Dec 3.1
1927	3,319,449,046	Dec 10.9
1926	3,746,162,762	Dec 5.9
1925	3,883,172,225	Inc 17.5
1924	3,282,078,089	Inc 1.5
1923	3,142,234,205	Inc 2.0
1922	2,529,603,981	Inc 52.2
1921	1,651,981,416	Inc 15.6
1920	1,427,059,396	Inc 8.8
1919	1,310,962,144	Inc 202.5
1918	433,000,000	—

The detailed returns by groups of cities for the years 1929 and 1928 compared as follows:

	1929	1928	Change, per cent
New England	\$192,258,903	\$205,179,027	D 6.2
Mid Atlantic	1,329,627,159	1,396,419,881	D 4.1
Central Western	574,083,361	793,229,693	D 27.6
Northwestern	119,669,267	116,560,304	I 1.6
Southeastern	194,700,917	202,234,332	D 3.7
Southern	208,500,005	273,970,968	D 24.6
Far Western	296,485,146	326,911,987	D 9.3
Total U. S.	2,913,384,758	3,304,507,092	D 11.8
New York City	944,868,782	934,806,661	I 1.0
Outside N. Y.	1,969,017,976	2,369,700,431	D 16.8
Canada	176,267,672	154,882,491	I 13.8

This authority stated that New York City building permit values in 1929 were \$944,366,782,

as against \$934,800,661 in 1928, or a gain of 1 per cent. The expenditure for building in New York City was 32.4 per cent of the total of 215 of the larger cities of the United States for which statistics were compiled, as against 28.2 per cent in 1928. Building in four of the five boroughs of Greater New York since 1925 (Richmond Borough not included) was as follows:

1925	\$1,012,940,978	1928	\$918,027,238
1926	1,031,441,405	1929	932,879,452
1927	870,108,777		

Outside of New York City, the northwestern group of cities showed an increase of 1.6 per cent over 1928, while the other groups, as indicated in the table, showed decreases varying from 3.7 per cent at the Southwest to 24.6 per cent at the South. The total building value for which permits were issued for 214 cities outside of New York City was \$1,969,017,976, or a decrease of 16.8 per cent from 1928. In the interval from 1920 to 1929, the aggregate expenditures at 120 identical cities compared as follows:

1920	\$1,214,082,696	1925	\$3,398,585,633
1921	1,463,752,811	1926	3,227,185,541
1922	2,288,408,634	1927	2,870,613,674
1923	2,811,366,000	1928	2,794,229,539
1924	2,936,714,639	1929	2,484,335,535

The 1929 construction value in the United States, according to the F. W. Dodge Corporation's review of building and engineering activity, showed a decline in the value of contracts awarded in 37 States east of the Rocky Mountains, the figures given being \$5,754,291,000, as compared with \$6,628,286,000 for 1928, \$6,304,055,000 for 1927, \$6,480,915,000 for 1926, and 6,006,426,000 for 1925. These various projects were defined as follows:

## BUILDING IN 1929

[Returns from F. W. Dodge Corporation's Review for 37 Eastern States, or About 91 Per Cent of the Total Construction of the United States]  
Contemplated Projects

Classification	No of Projects	Valuation	No of Projects	Contracts Awarded*	
				New Floor Space in Sq Ft	Valuation
Commercial Buildings	29,050	\$1,338,670,600	24,137	161,731,100	\$ 912,688,400
Industrial Buildings	7,695	1,137,866,300	6,680	108,781,600	736,512,400
Educational Buildings	5,609	444,261,400	4,531	60,644,000	381,908,000
Hospitals and Institutions	1,530	252,680,300	1,190	19,494,200	152,203,700
Public Buildings	2,552	244,442,700	1,363	15,626,100	120,777,900
Religious and Memorial Buildings	2,774	175,222,100	2,277	12,817,300	106,114,200
Social and Recreational Buildings	1,116	326,184,800	2,484	19,709,300	140,019,400
Residential Buildings	122,148	2,578,492,800	110,498	387,671,300	1,915,727,500
Public Works and Public Utilities	25,022	2,188,106,600	19,072	8,092,600	1,248,342,000
	200,020	\$8,886,627,500	172,172	791,564,400	\$5,754,290,500

\* Including projects without general contractors, subcontracts being let directly by owners or architects.

• 194,090 buildings  
• 150,994 buildings

These figures, as already stated, are for 37 States east of the Rocky Mountains and include about 91 per cent of the total construction in New York State and northern New Jersey, the contracts awarded in 1929 amounted to \$1,407,273,000 in value, as against \$1,814,317,000 in 1928. In eastern Pennsylvania, southern New Jersey, Maryland, Delaware, District of Columbia, and Virginia, similar contracts for 1929 amounted to \$671,500,000, as against \$787,673,000 in 1928. In western Pennsylvania, West Virginia, Ohio, and Kentucky, contracts awarded in 1929 totaled \$685,536,000, as against \$723,410,000 in 1928. In the Central West, or Illinois, In-

diana, Iowa, Wisconsin, Michigan, Missouri, Kansas, Nebraska, and Oklahoma, 1929 contracts amounted to \$1,681,836,000, as against \$1,934,775,000 in 1928. In Minnesota, North Dakota, South Dakota, and northern Michigan, contracts awarded in 1929 totaled \$94,505,000, as against \$80,101,000 in 1928. In North Carolina, South Carolina, Georgia, Florida, Alabama, Mississippi, Tennessee, Arkansas, and Louisiana, contracts awarded in 1929 were \$537,459,000 and in 1928, \$560,925,000. In Texas in 1929, building contracts to the amount of \$217,800,000 were awarded, as against \$213,409,000 in 1928. In the New England States, 1929 contracts awarded in 1929 amounted to \$1,111,111 and those awarded in 1928 to \$495,581,000.

The notable decline of construction in 1929 also was indicated in the compilation of Facts and Figures of Construction, made by *Engineering News-Record* (New York), which summarizes and discusses engineering construction and residential building as reported in its columns. The total for 1929 was given as just over \$9,130,000,000, being the first time in nine years that there had been a decline from one year to another in such construction. The cost index, based on 1913 as 100, was given as 207.02 and the comparative volume of construction referred to the same year, as 280 on a similar comparison. The decrease in 1929 was due in large measure to the decline in residential construction which was estimated at 31 per cent. In engineering construction, there was a total increase of 10 per cent greater than the level reached in 1928.

The matter of construction figured prominently in the Washington conference in November and December, when leaders of various fields of industry and commerce were asked to present reports on their programmes for the succeeding year. These figures indicated that construction

in 1930 would reach \$10,000,000,000, to which utility construction would contribute to a marked degree. The railroad construction budget for 1930 was reported at \$1,050,000,000, or an increase of 10 per cent over 1929, while the central station budget for 1930 was placed at \$913,575,000. Public works were planned to an increased degree totaling about \$3,000,000,000, of which \$1,000,000,000 was for municipal work and \$271,000,000 for Federal work. State construction also figured to an important degree. See ARCHITECTURE.

**BUILDING AND LOAN ASSOCIATIONS.**  
See COOPERATION.

**BULGARIA.** A constitutional monarchy in the Balkans lying to the south of Rumania and the east of Jugoslavia. Capital, Sofia, reigning King in 1929, Boris III, who succeeded to the throne upon the abdication of his father, Oct. 3, 1918.

**AREA AND POPULATION.** As a result of the World War, the area of Bulgaria was reduced from 53,305 to 39,814 square miles. The population according to the census of 1926 was 5,483,125, as compared with the actual population according to the census of 1920, of 4,846,971. The estimated population on Jan. 1, 1929, was 5,586,800. The surplus of births over deaths was 109,341 in 1926, and 94,100 in 1925. The chief cities with their populations, according to the 1926 census, are Sofia, 213,162, Plovdiv, 185,188, Varna, 60,787, Ruschuk, 45,672, Shvivo, 29,335, Pleyna, 29,063, Stara Zagora, 28,939, Choumen, 25,316, Burgas, 31,428.

**EDUCATION.** Primary instruction is free and compulsory for children between the ages of 7 and 14, and is supported by the state authorities. In 1926-27 there were 4182 national elementary schools, with 12,655 teachers and 402,807 pupils, 1665 private elementary schools, with 2583 teachers and 70,850 pupils, and 1201 national gymnasiums, with 293 teachers and 133,705 pupils. Various other national and private schools and colleges brought the total to 7440, with 24,903 teachers and 673,579 pupils. The State University at Sofia had 298 professors and teachers and 3002 students in 1926-27. There is also a free (private) university with 44 teachers and 2029 students.

**PRODUCTION.** The principal occupation of the people of Bulgaria is agriculture, more than 80 per cent of the people engaging in this pursuit. The land is held in absolute freehold, the greater part of the holdings being under small proprietors (1 to 6 acres). The methods of cultivation are primitive, although in recent years some modern farm machinery has made its appearance. Preliminary results for 1928 showed an improvement over 1927 in the yield of most crops, with the exception of tobacco, corn, and sugar beets. The smaller crop of tobacco was the effect, in part, of a reduction in sown area. The reduction in the size of the crop was offset in part by a rise in the price obtained. The acreage sown to sugar beets declined from 21,000 hectares in 1927 to 18,000 hectares in 1928, chiefly because of foreign competition. The area devoted to rapeseed increased sharply to 45,580 hectares (1 hectare equals 2.47 acres). Although most crops were larger than in the preceding year, the decreases in corn and tobacco are significant because of their importance in the exports of the country, in 1927 these two products represented approximately 30 per cent of the total value of all Bulgarian exports.

Estimates of agricultural production during 1928 (1927 figures in parentheses) are as follows: wheat, 1,380,000 metric tons (1,148,000), corn, 463,000 (532,000), barley, 343,000 (280,000), rye, 234,000 (177,000), oats, 105,000 (94,000), sunflower, 42,280 (34,170), rapeseed, 42,000 (3300), sugar beets, 169,000 (242,000). Tobacco production was estimated at 23,041,000 pounds in 1928, as compared with 34,811,000 in 1927, and the 1928 rose crop, at 250,000 miskals (1 miskal equals 0.16953 ounce avoirdupois), as compared with 504,030 miskals in 1927. The Bulgarian production of silk cocoons for 1928 was

estimated at about 1,900,000 kilos, as against 2,025,000 in 1927, and an average of about 1,520,000 for the previous five years.

The total area sown was slightly larger in 1928 than in 1927, the figures being 6,075,240 acres for 1927 and 6,109,005 in 1928. The wheat acreage rose from 2,704,185 to 2,811,885, the rye acreage, from 409,005 to 484,707, and barley, from 567,110 to 607,775. The oat acreage decreased from 329,745 acres in 1927 to 296,897 in 1928 and the corn acreage, from 1,701,422 to about 1,613,750.

Industrially, Bulgaria recorded considerable expansion in the textile industry during 1928 and slow progress in the manufacture of tobacco, cement, ceramics, and vegetable oils, and in tanning, metallurgy and wine making. Sugar production in 1928 was slightly over 25,000 metric tons, the 1927 output was approximately 36,000 metric tons. Coal production increased to 1,402,000 tons, as against 1,237,650 in 1927 and 1,205,760 in 1926. Most of the increase is due to the larger output of the Pernik State mine, where the production was 1,021,614 tons in 1927 and 1,188,554 tons in 1928. Consumption of coal by both state railways and industrial enterprises increased during the year. Other leading minerals, with the production figures for 1927 in metric tons, were copper, 10,934, lead, 1229, zinc, 1459, zinc-lead, 6720, lead copper, 16,789, aluminum, 2841.

**COMMERCE.** A large adverse balance marked Bulgaria's foreign trade for 1928, in contrast to the favorable balance occurring for the previous year. The 1928 imports exceeded exports by 808,000,000 leva (one lev equals \$0.0072), in 1927 exports exceeded imports by 498,000,000 leva. Heavy purchases of textile materials and of machinery in 1928 boosted the value of imports while the comparatively poor yields of some of the principal export crops were reflected in decreased exports. The value and amount of the commodities entering into Bulgaria's foreign trade in 1927 and 1928 are shown in the table on page 131.

Germany again ranked first as the country of origin for Bulgarian imports, furnishing 21.2 per cent of the total in 1928. Other countries providing Bulgaria's imports were Italy, 15.2 per cent, Czechoslovakia, 10.7 per cent, England, 10.4 per cent, and Austria, 8.1 per cent. The chief purchasers of Bulgarian exports were Germany, 27.9 per cent, Austria, 15.3 per cent, Italy, 11 per cent, Greece, 8.1 per cent, and France, 5.6 per cent. Imports from the United States mounted from 96,841,100 leva (\$701,000) in 1927 to 168,202,000 leva (\$1,213,000) in 1928. Exports to the United States were 78,115,000 leva (\$563,300) in 1928 and 68,260,600 leva (\$494,000) in 1927.

**FINANCE.** With the aid of a £5,000,000 foreign loan negotiated late in 1928 under the auspices of the League of Nations, lev exchange was stabilized at \$0.0072, provision was made for wiping out budget arrears and for increasing the credit available for agricultural purposes, and a general reform of the public finances was undertaken to further the economic development of the country. The bulk of the loan was placed at the disposal of the National Bank late in 1928 and the remainder was paid in three installments during 1929. It was to be amortized over a period of forty years and its service was guaranteed by import and export duties. The proceeds of the

loan were being utilized as follows £1,500,000 to the National Bank as part payment of the national debt to the bank. £150,000 for the same purpose to the Central Cooperative Bank. £1,100,000 for payment of budgetary arrears, £1,250,000 for railways and roads, and £500,000 for expenses incurred in connection with the earthquakes in the southern part of the country in April, 1928.

Estimates for the fiscal year ending Mar 31, 1929, placed the revenues at 7,508,905,000 leva and expenditures at 7,481,513,000 leva. For 1927-28 the estimates were revenues, 6,993,100,000 leva, expenditures, 6,992,877,000 leva. Principal sources of revenue (in leva) were direct taxes, 918,000,000; indirect taxes, 2,647,000,000, duties, 636,000,000, fines and requisitions, 72,000,000, government-owned utilities, 1,131,700,000 other State property, 396,000,000, miscellaneous, 1,467,705,000. Expenditures (in leva) were distributed in part as follows, service of the public debt, 1,784,749,000, interior, 452,832,000, education, 802,162,000, war, 1,280,753,000, agriculture, 493,537,000, public works, 372,335,000, railways, post, and telegraphs, 1,309,292,000.

Under the League of Nations protocol governing the issuance of the stabilization loan, the budget for 1929-30 is limited to 7,000,000,000 leva, with the exception of special funds and those for the service of the loan. The budget for 1929-30, as submitted to Parliament, estimated receipts at 6,680,000,000 leva and expenditures at 6,274,000,000 leva, exclusive of annexed funds amounting to 478,000,000 leva which bring the total expenditures to 6,752,000,000 leva.

Notes in circulation at the end of 1928 totaled 4,173,017,000 leva, with a metallic cover of

1,480,661,000 leva as compared, with a note circulation at the end of the previous year of 3,726,972,000 leva, with a metallic cover of 1,442,817,000 leva. The stringency in the credit situation eased somewhat during 1929. On Oct 31, 1928, the foreign debt was given as follows: consolidated, 479,280,094 gold francs, non-consolidated, 11,810,634 gold francs, repatriation debt, 604,374,866 gold francs, debt from occupation, 14,263,404 gold francs. The internal debt totaled 5,354,054,015 leva, of which 754,047,580 leva was consolidated and 4,600,007,035 leva non-consolidated.

**COMMUNICATIONS** All railways in Bulgaria are owned and operated by the state under the title Bulgarian State Railways, with the exception of a few privately owned and operated by timber companies. In 1928 Bulgaria had 1426 miles of railway of standard gauge and 255 miles of narrow gauge. About 321 additional miles were completed during 1929. Total revenues of all railways for 1927-28 were 1,063,221,000 leva and total expenditures, 817,498,000 leva, leaving a surplus of 245,723,000 leva. Freight traffic in 1928 totaled 330,000 carloads, as against 317,000 in 1927.

The number of ships calling at the principal ports of Bulgaria in 1928 showed a decline from 1927. At Varna, 357 ships of 609,656 tons called during 1928, as against 459 ships of 653,106 tons in 1927, the respective figures for the port of Burgas were 440 of 746,687 tons, and 455 of 765,036 tons. The decline in shipping was chiefly due to the decrease in the volume of cereals and other exports.

**GOVERNMENT** The King is the head of the Government, assisted by a council of ministers non-

inated by him and a single legislative chamber, known as the Sobranje, composed of 273 members in 1929 the King was Boris III. The parties in the Sobranje, elected in May, 1927, contained the following party groups: Government Coalition, 168, Agrarians, 48, Macedonian Independents, 11, National Liberals, 14, Democrats, 12, Radicals, 2, Social Democrats, 10, others, 8. The ministry as organized Sept. 12, 1928, was as follows: Premier and Minister of Interior, André Liatpcheff, Minister of Education, Nicholas Naidenoff, Justice, Dr. Theodore Kuleff, Commerce, M. Trvetco Bobotchevsky, Finance, Vladimir Molloff, Public Works, Slaveico Vasileff, Posts and Railways, R. Madjaroff, Foreign Affairs, Athanasie Buroff, Agriculture, Dimitri Christoff, War, General Kakardjoff (Jan. 11, 1929).

HISTORICAL Bulgaria's relations with Yugoslavia, which had been badly strained as a result of Macedonian comitadjí raids across the frontier into Yugoslavia, grew steadily worse following the proclamation of a dictatorship in Yugoslavia on January 6 and then appeared to take a turn for the better in August. As was to be expected, the fluctuating relationships between the two countries were reflected in Bulgaria's policy toward Italy, France, and Great Britain.

A few days after the proclamation of the dictatorship by King Alexander, European observers were startled to learn that the proposed appointment of General Vukoff, the Bulgarian Minister of War, as Minister to Rome had been approved by the Italian government. This was considered evidence of a *volte face* in Bulgarian foreign policy, which under Foreign Minister Buroff had heretofore been conciliatory toward Yugoslavia, and her chief ally, France.

The Bulgarian frontier, closed before the *coup d'état* in Yugoslavia, was reopened under the dictatorship and in an effort to improve relations between the two countries a conference was held at Pirot where a convention was drafted covering the troublesome features of the frontier problem. The difficulties were the result of the Yugoslav attempt to denationalize some 500,000 Bulgarians and Macedonians incorporated in Yugoslavia by the Treaty of Neuilly. Border raids continued throughout June and July, however, and the Pirot convention remained unratified, while charges and counter charges further complicated the situation. The Belgrade Government raised particular objection to the passage of a law granting amnesty to former Premier Vasil Radoslavoff, who brought Bulgaria into the World War on the side of Germany, and to Ministers and other officials of the pre-war régime in Bulgaria, many of whom were in exile. The death of Radoslavoff in Berlin on October 21 prevented his return, with its accompanying complications. He and the other former officials had been sentenced by Bulgarian courts, but in accordance with stipulations of the peace treaties, on charges of war guilt. It was expected, however, that former Czar Ferdinand, who abdicated the throne in 1918, would return to Bulgaria from his place of exile in Coburg for a brief visit with his son and daughter, King Boris and Princess Eudoxie. The measure was bitterly opposed in the Bulgarian Parliament, as well as by the Belgrade government.

Early in July the British Government proposed that a neutral commission, similar to that which had served effectively in reconciling the

Græco-Bulgarian frontier dispute, be placed in charge of the frontier zone. The suggestion was temporarily rejected, however, on the ground that the Pirot convention, then before the respective Parliaments, contained a similar provision. On August 16, it was announced that the ban of excommunication against the Greek Church in Bulgaria, imposed more than half a century ago by Greek Orthodox authorities, would soon be canceled under an agreement reached by the Patriarchs of Constantinople, Alexandria, Antioch, and Jerusalem, the Archbishops of Poland and Cyprus, and the Metropolitan of Sofia. The ban was not due to a doctrinal dispute but to the refusal of the Bulgarian church to accept membership in the See of Constantinople. Italy was understood to have strongly opposed the reconciliation on the ground that it represents another step in the movement toward a Bulgar-Serb entente, which began in 1928 with the collapse of the proposed marriage between King Boris and Princess Giovanna of Italy. The development also frustrated a plan for the reunion of the Greek Orthodox and Roman Catholic churches through the Bulgarian church, which Pope Pius XI was supposed to have cherished.

The action of the Committee on Eastern Reparations, which lived in Paris tentatively at \$2,500,000, at the end of the year in Paris in the autumn, aroused widespread protests in the country. On November 18, there were large demonstrations in Sofia, including riotous gatherings before the French and British legations, a two-hour stoppage of all work, and a 15-minute stoppage of traffic. In December, Foreign Minister Buroff and Finance Minister Moloff visited the British Foreign Office in London in an attempt to obtain a reduction in reparation payments before the second Hague Conference opened on Jan. 3, 1930.

National resentment was further aroused on November 21 by the announcement that Henri Charon, French commissioner appointed by the League of Nations to supervise the handling of the League's loan to Bulgaria, had sequestered \$3,000,000 of the income of the Bulgarian state railways. His action was said to be due to the refusal of the Ministry of Railways to reorganize the railway system in accordance with his requests made for several years past. The government found it necessary to prohibit further demonstrations against the allied reparation requirements and to guard the foreign legations in Sofia.

During the week beginning May 12, the nation celebrated the one thousandth anniversary of the accession of the Bulgarian King, Simeon the Great, the liberation of Bulgaria 51 years before, and the name day of King Boris. On May 24, the Chamber of Deputies ratified the Kellogg Pact and a treaty of arbitration and conciliation with the United States. See JUGOSLAVIA, and RUMANIA, under History.

**BULLARD, ARTHUR** ("ALBERT EDWARDS"). American journalist, died in Geneva, Switzerland, Sept. 10, 1929. He was born in St. Joseph, Mo., Dec. 8, 1879, and was educated at Blair Presbyterian Academy in New Jersey, and at Hamilton College. In 1905 he became a foreign correspondent for *Harper's Weekly*, *Colliers' Weekly*, and *The Outlook*, traveling in Russia, French North Africa, and Central America. He represented the *Outlook* during the Balkan War,

1912-13, and contributed to the *Outlook*, *Century*, and *Atlantic Monthly* during the World War. As a member of the committee on public information, Washington, D. C., from 1917 to 1919, he directed successively the Russian Division at Moscow and the Siberian Division at Vladivostok. In 1910 he was associated with the Department of State in its Russian affairs. In 1921 he became editor of *Our World*, a position which he held until 1924. He was the European representative of the League of Nations Nonpartisan Association in Geneva in 1925, becoming a member of the secretariat of the League, 1926-27. He was also attached to the American delegation to the International Economic Conference in Geneva in 1927. He wrote, sometimes under the pen name, "Albert Edwards" *Panama* (1911), *A Man's World* (1912), *Comrade Yetta* (1913), *The Barbary Coast* (1913); *The Diplomacy of the Great War* (1915), *Mobilizing America* (1917), *The Russian Pendulum* (1919), *The Stranger* (1920), and *A B C's of Disarmament and Pacific Problems* (1921).

**BULOW**, bú-ló, BERNARD, PRINCE VON A German statesman, died Oct. 28, 1929, in Rome, Italy. He was born May 3, 1849, at Klein-Flottbeck, Holstein. He served in the Franco-Prussian War of 1870, and in 1872 entered the Prussian civil service. He joined the German Foreign office in 1874, serving as secretary of the legation at Rome, St. Petersburg, and Vienna, and chargé d'affaires at Athens during the Russo-Turkish War (1877-78). He was sent as Minister to Rumania in 1888 and as Ambassador to Italy in 1893. In 1897 he was appointed Foreign Secretary and two years later negotiated with Spain the treaty by which Germany acquired possession of the Caroline, Pelew and Ladrones islands. For these services he was made a count. From 1900 to 1909, when he resigned, he was Chancellor of the German Empire and Prime Minister of Prussia. In 1905 he opposed the ambitions of France in Morocco with so much success that he was given the rank of prince. Prince von Bulow fostered in all of his undertakings the imperialistic philosophy which was the German Kaiser's in the years immediately preceding the World War. Prince von Bulow resigned as chancellor in 1909, when by the failure of his budget proposals he lost a majority in the Reichstag. He was given temporary charge of the German Embassy in Rome in December of 1914 with the hope that he might smooth over the differences between Austria-Hungary and Italy, but he was unsuccessful and Italy joined the forces of the Allies in May 1915. Although he lived in retirement after 1915, giving out very few public statements, the policy which Prince von Bulow advocated is generally conceded as largely responsible for the position of Germany at the opening of the World War in 1914. In his *Imperial Germany* (1914) which was translated into English in 1914 and revised in 1916 to omit many compromising statements, he defends his political principles. Consult Martin, *First Bulow and Kaiser Wilhelm* (Leipzig, 1909).

**BURGULARY INSURANCE**. See INSURANCE.

**BURMA**. The largest and most easterly province of British India, since 1923, a governor's province under the Government of India Act of 1919. Area, 262,732 square miles, population (1921), 1,3,212,102. Rangoon, with a population of 345,505, is the capital of Lower Burma,

and Mandalay, with a population of 148,917, is the capital of Upper Burma. Politically, Burma is a province of British India, but geographically and socially, it may be regarded as a separate unit having little in common with India proper. In 1926-27 there were 443,302 students in 6885 recognized schools and colleges. Being almost entirely agricultural, it does not share the rest of the country's industrial ideas. Such industries as Burma has are those essential for the preparation of its products for the market—rice mills for husking rice, sawmills for squaring its teak, refineries for oil, and cotton gins. Rice mills alone make up about three-fifths of its total industrial activity. In 1927 there were 940 factories of all kinds with 101,353 employees. The principal crop is rice, two-thirds of Burma's agricultural area being given to its culture. In poor years, most of the crop is consumed locally, leaving but little surplus for export. Tin, tungsten ore, silver, and petroleum are mined. Oil production in 1929 reached 262,000,000 gallons, valued at \$17,850,000. The estimated revenue of the Government in 1927-28 was 1077 lakhs and the expenditure, 1220 lakhs (one lakh equals \$36,500 par). The railways of the province, 1908 miles in length, were taken over by the Government of India in January, 1929. The government is administered by a governor and legislative council of 103 members. Governor in 1929, Sir Charles A. Innes.

**BURROWS**, THOMAS REYNOLDS WINFRED ORSFIELD, BISHOP OF CHICHESTER. Died at his birthplace, London, Feb. 13, 1929. Born Nov. 9, 1858, he received high scholastic honors from Eton and Corpus Christi and Christ Church, Oxford. He became tutor at Christ Church, 1884, and was ordained two years later. As principal of the Leeds Clergy School, 1891-1900, he showed particular ability for administration and teaching. He was made vicar of Holy Trinity at Leeds in 1900, and transferred to St. Augustine, Edgelyston, three years later, in order to aid Dr. Gore in organizing the Archdiocese of Birmingham of which Dr. Burrows served as archdeacon, 1904-12. He was consecrated Bishop of Tuoro in 1912. Having become associated with various central organizations, particularly the revision of the prayer book, Dr. Burrows was appointed to Chichester in 1919, where he could be in closer touch with administrative affairs.

**BURTON**, THEODORE ERIC American legislator, died Oct. 28, 1929. He was born in Jefferson, Ohio, Dec. 20, 1851 and was graduated from Oberlin College in 1872. In 1875 he was admitted to the bar and began the practice of law in Cleveland, Ohio. Elected as a Republican representative from Ohio to the Fifty-first Congress in 1880, he served again from 1895 to 1909, and from 1921 to 1927. In 1909 he resigned from Congress to become United States Senator from Ohio for one term. He was a member of the executive council of the Interparliamentary Union from 1904 to 1914, and after 1921 he was on the executive committee. By the appointment of President Roosevelt, he was chairman of the Inland Waterways Commission in 1907-09, and in 1909-12 was created by Congress chairman of the National Waterways Commission. President Harding appointed him a member of the World War Debt Funding Commission in 1922, and he served as chairman of the United States delegation to the conference for the control of international traffic in arms at Geneva, Switzerland, in

1925 During 1911-15 he was president of the American Peace Society, and was reelected in 1925. He was the Stafford-Little lecturer at Princeton in 1919 and the Cutler lecturer at Rochester University in 1922. His books include *Financial Crises and Periods of Industrial and Commercial Depression* (1902), *Life of John Sherman* (1906), *Corporations and the State* (1911), *Some Political Tendencies of the Times and the Effect of the War Thereon* (1919), *The Constitution, Its Origins and Distinctive Features* (1923).

**BUSINESS REVIEW.** The year 1929 may, from a business standpoint, be roughly divided into three periods. The first six months, or a little less, represented the closing of the great boom which occupied nearly the whole of 1928. The months from June to October represented a period of preliminary decline, with recession in nearly all staple lines. November and December were months of definite depression following the financial panic which had become definitely recognized on October 23.

During the first period, employment was full, production active, and exportation and general business at high point. Indexes of industrial production, adjusted to allow for seasonal variations and published by the Federal Reserve Board (with the output of the years 1923 to 1925 as a base of 100), reached a climax in June when the index was 126. Thereafter there was a steady decline to 106 in November and in December. During the second period, as thus indicated, transition had set in throughout the productive field. It had, however, not made itself definitely apparent in all lines, for building contracts did not reach their peak of 159, until July, when the recession had already started in productive enterprises. Freight-car loadings on the other hand, were at top point in May, with an earlier recession, therefore, than was noted in either of the other lines. All forms of activity were at low point in November. The third period covering November and December and extending indefinitely into 1930, illustrated the reflex effects upon industry of financial breakdown added to the tendency to natural recession which had already made itself evident following upon the large industrial output of 1928.

The accompanying table furnishes a review of the movement of business during the past few years and illustrates more clearly the generalizations which have just been set forth.

INDEX OF INDUSTRIAL PRODUCTION  
[Index numbers, adjusted for seasonal variations  
1923-1925 average=100]

Month	1922	1923	1924	1925	1926	1927	1928	1929
January	73	100	100	105	106	107	106	117
February	76	100	102	105	107	109	109	117
March	80	103	100	104	107	111	109	119
April	77	107	95	103	107	109	109	122
May	81	107	89	103	106	111	109	123
June	86	105	85	102	107	108	108	126
July	86	103	83	103	107	106	109	124
August	84	102	89	103	111	107	112	123
September	88	100	94	102	112	105	114	121
October	94	99	94	105	111	103	114	117
November	97	97	97	106	108	99	112	106
December	100	86	101	108	105	89	113	
Annual index	85	101	95	104	108	106	111	

The changes which had thus shown themselves in production and transportation, as well as in building, were likewise observable in distribution. Chain stores and retail enterprises generally be-

gan the year with very good results. They, however, began to lose ground after the first few months, and toward the end of the year were suffering considerable depression, while employment, usually taken as an index of "general business" reached the lowest point for the year in November and December, when both the number of men employed and pay rolls were approximately at the same level as at the beginning of 1929 or slightly lower, according to date of composition. Relatively speaking, this was a serious recession, and although "Christmas trade," stimulated by large dividend disbursements, bonuses to employees, and the like, showed a recovery so that it was generally spoken of as being as good as that of 1928, the actual receipts of many classes of stores showed quite decisive decline when analyzed for the whole period of depression.

**COMMODITY PRICES.** At the opening of the year 1929, commodity prices had for some time past been regarded as distinctly stable. They had not varied much from the level established by taking the year 1926 as a base or 100, over a period of about three years, for the average index at the beginning of 1929 was 97.2, indicating therefore a recession of less than three points in three years. During the active business period to which reference has already been made, prices were fairly well maintained, and in July the index stood at 98. Recession to about the level of the beginning of the year occurred during August and September, and then followed the drop caused by the reflex effect of the panic with a reduction to 94.1 in November. The actual index numbers for all commodities with comparative figures for 1927 and 1928 were as follows:

MOVEMENT OF WHOLESALE PRICES

	1926	1927	1928	1929
January		97.0	96.3	97.2
February	102	96.0	96.4	96.7
March	100	95.0	96.0	92.5
April	100	94.0	97.4	96.8
May	101	94.0	98.6	95.8
June	101	94.0	97.6	96.4
July	100	94.0	98.3	98.0
August	99	95.0	99.8	97.7
September	100	97.0	100.1	97.5
October	99	92.2	Bulg. 8	96.3
November	98	96.6	to 96.7	94.4
December	98	96.6	ulwa 6.7	94.2

¢

Further analysis of the wholesale price figures by groups shows that, taking the year as a whole, the commodities which yielded least to downward pressure were housefurnishings, building materials, finished foods, and fuels, while those which suffered most were farm products, hides and leather, textiles, and some of the metals. Great price stability was shown by various groups of commodities which had fallen under the control of price-fixing organizations or groups. Examples of this sort are conspicuously furnished by copper, which remained stable with a base price of 18 cents (though with fluctuations above that figure for a short time but none below it). Similar price-fixing had made itself apparent in certain parts of the steel trade in alcohol and in paint materials, in tobacco (manufactured), and in a variety of other articles. On the other hand, agricultural products which, at about the beginning of the year, appeared to have an excellent prospect of stability or even of gain in prices, particularly in view of the activity of the so-called Farm Relief Board with its stabil-

izing programme, and which had reached an average of 107 or better in July and August under the influence of the Board, suffered severely from the panic and dropped to 101.

Toward the close of the year, the success of price-fixing began to be doubted in a good many branches of business, due to the belief that the maintenance of high prices was "holding up," or reducing, consumption. Relaxation was thus unavoidable here and there, and secret price cutting began to manifest itself. The inevitable result was a reflex effect upon the general average, so that, although the general average as just seen reveals only a very moderate fluctuation, the truth is that when individual commodities are considered, the year 1929 was really a period of considerable disturbance in prices. This disturbance was aggravated by the fact that some commodities, such as rubber, which had previously been price fixed, now for the first time succeeded in regaining a free market.

**MANUFACTURING.** Manufacturing establishments began the year with a very high percentage of activity and maintained it during the early months of the year. The general average for 1928 had been 110, but January, 1929, showed a continuation of the sharp increase that had begun in the last third of 1928, the index for that month being 117. A steady climb to the figure of 126 in June, already cited, made the first six months of the year a memorable period with an output fully as great, if not greater, than that which had been attained during the World War by the exercise of utmost social pressure. This increase was rendered possible by the fact that, during the intervening years, so much progress had been made in developing new methods of labor organization, factory adjustment, and, to some extent, industrial discovery or method. Manufactures as such (apart from general industrial production) showed an especially great gain with an increase of 28 per cent in June over the 1924-25 base. Business was conspicuously good in iron and steel which established a remarkably high record for the year, with an index of 155 in June. High records were also made in textiles, paper and printing, automobiles, cement, petroleum, and rubber. Industries which lagged behind were foods and a few others. Coal showed lack of demand and inability to gain ground, and the same was true of silver and several other mineral products. Remarkable expansion occurred in the automobile industry which was estimated to have produced 5,500,000 units for the year (including both commercial and passenger types). See AUTOMOBILES. Retail trade showed very high figures of gain, and as already noted lost ground only relatively little at the end of the year, being held to a high average by large "holiday" buying. Factory employment and pay rolls held their own relatively better than output.

**AGRICULTURE.** Agriculture on the average succeeded in turning out a crop of practically normal proportions. The usual variations in anticipated output were unnoted during the year, but on the whole, the general condition was not far from normal during the forepart of the year, weather conditions were pretty generally favorable, but the intense heat and dry weather of the summer impaired the output of some of the Northern crops and fruit and produce generally suffered shrinkage. The total value of 50 principal crops, as estimated by the Department of Agriculture, was \$8,580,000,000 against a figure for the

preceding year of \$8,456,000,000. See AGRICULTURE.

The situation as to the values of principal crops may be reviewed as follows:

Crop	Production	Value
Corn	2,622,189,000 bus	\$2,048,194,000
Oats	138,654,000 "	518,445,000
Cotton	14,919,000 bales	1,225,082,000
Cottonseed	6,540,000 tons	261,066,000
Barley	307,105,000 bus	168,807,000
Apples	139,754,000 bbs	184,107,000
Oranges	31,100,000 bxs	469,201,000
White potatoes	757,451,000 bus	120,525,000
Wheat	806,508,000 "	840,921,000
Hay	114,639,000 tons	1,349,000,000
Tobacco	1,500,891,000 lbs	285,583,000

The one-crop system which had been so injurious in the Northwest showed signs of change through the introduction of diversification, dairying, and the like. The result was to continue the improvement of business in the agricultural regions, and to strengthen the general position of the farmer, particularly in his financing. A decline of indebtedness and a larger settlement of mortgage obligations was the result. Although bank failures were numerous during the year, the number of them in the country districts was considerably reduced, as compared with the preceding year.

**GENERAL BUSINESS.** General business was distinctly more profitable during 1929 than during the year. Corporate earnings for the first six months of the year showed great increase. For the last two months of the year, decided recession occurred, but it was not sufficient to offset the gains which had already taken place, so that a great many corporations reported marked gains in their earnings for the year, as compared with 1928. These earnings were naturally very irregularly distributed, but it may fairly be said that there was a fairly general advance in some proportion over the entire field. The railroads, for example, reported an increase of earnings which amounted to about 71 per cent, while industrial earnings in some cases doubled those of 1928 and in other cases showed more moderate, but still great, advance. Computations made by certain bank statisticians of the earnings of business corporations showed a gain, as compared with 1928 amounting to approximately 16.8 per cent. High prices and a greater degree of price stability helped a good many enterprises during the forepart of the year, while recessions which occurred in November and December tended to cut away some portion of these gains but still left marked advances for the 12 months as a whole.

**BUSINESS FAILURES.** During the past few years, business failures have been a serious feature of the industrial situation, and it was an especially favorable factor in the operations of 1929 that a very distinct decline made itself apparent during the first, second, and third quarters. In the fourth quarter, the reflex effect of the panic began to bring into difficulty enterprises which had been on the verge of collapse or failure but had previously kept clear of it, and there was a marked increase during December both in the number and amount of liabilities involved. It was also to be noted that, in spite of the decrease in number of failures, liabilities involved for the year as a whole were larger in the second and fourth quarters, so that an analysis of the year presents a fairly "spotty" situation. Bank failures also

**MINERAL PRODUCTION** The total value of the  
mineral product of the State for 1927 was \$459-  
470,570, for 1926, \$524,282,257. The production  
of petroleum, in which the State held second rank,  
and which contributed more than half of the  
above totals was well maintained in 1928, but  
because of a lower estimated value at the wells, it  
contributed less to the value aggregate of the  
State's mineral industries. There were produced  
in California in 1928 231,982,000 barrels of  
petroleum, in 1927 231,196,000, but the value  
of the product for 1927 was \$260,735,000 while  
for 1928 it was estimated at but \$241,500,000.  
With a view to preventing the wasteful exploita-  
tion of petroleum and the depression of its price  
below reasonable levels, important public action  
was taken in 1929 to limit production. Important  
in the production of the allied metals gold, silver  
and copper, the State mined these in 1928 on a  
somewhat decreasing scale. The combined value  
of gold, silver, copper, and lead produced in Cali-  
fornia in 1928 was \$15,381,783, or 9 per cent less  
than the value of 1927. The decrease was chiefly  
in gold the most important component of the  
totals. The value of gold mined in 1928 was \$10-  
785,315; in 1927, \$11,071,018. The quantities  
were 1928, 521,739 fine ounces, 1927, 564,585.  
The decline took place entirely in the placer  
mines, of which the production fell to 234,640

fine ounces for 1928, from 282,380 for 1927. The lode mines made a slight increase of production to 287,090 fine ounces for 1928, and the tonnage of ores rose, although the number of operating lode mines, as well as of placers decreased. The silver production of 1928 was 1,478,771 fine ounces, in value, \$865,081, that of 1927, 1,020,242 ounces, \$918,077. Copper was produced to the amount of 25,150,743 pounds, in value, \$3,621,707 in 1928, of 27,133,008 and \$3,554,424 in 1927. Lead, to the quantity of 1,981,037 pounds, value \$109,680 in 1928, and of 2,718,014 pounds, \$171,235 in 1927. The cement industry was less active in 1928, producing 13,452,221 barrels, as against 14,580,654 for 1927; cement shipments attained the value of \$25,552,069 for 1928, for 1927, of \$26,623,396. The stone production of 1927 was 9,764,740 short tons, valued at \$9,963,054. That of sand and gravel attained the value of \$8,045,257, clay products, \$20,967,988. Natural gas production was 212,264,000 M cubic feet, valued at \$50,946,000, as against 204,915,000 M, in value \$36,425,000 for 1926. Despite the abundance of petroleum, the production of natural-gas gasoline rose in 1928 to 545,200,000 gallons, from 498,020,000 for 1927; its value total fell to \$50,866,000 (estimated) from \$52,436,000.

The total value of gold, silver, copper, lead, and zinc produced from ore mined and treated in California decreased from \$15,381,783 in 1928 to about \$14,998,700 in 1929 according to preliminary figures of the U. S. Bureau of Mines. No zinc ore was mined in the State in 1929 though a small quantity of zinc was recovered from treating lead-silver ores mined in Inyo County. Copper was the only metal to make an outstanding increase in its yield compared with 1928 and its gain in value practically offset the loss in the gold yield recorded in 1929. The value of the gold recovered from lode and placer mining in 1929 was estimated at about \$8,392,800, compared with a value of \$10,785,315 in 1928. It is probable that this decrease occurred in both lode gold and the gold won by the dredges, as most of the companies usually considered in the class of the largest ten gold producers of the State decreased their output. In Trinity County, three dredges were working, as compared with two in 1928. Water conditions were unfavorable for hydraulic mining and though some public interest in drift mining was evidenced, the gold by this method of mining again remained small. The quantity of silver mined and treated in California decreased from 1,478,771 ounces in 1928 to about 1,066,100 ounces and the value from \$865,081 to \$569,300. The production of copper in California increased from 25,150,743 pounds in 1928 to about 33,255,500 pounds in 1929 and the value from \$3,621,707 to \$5,952,700. Copper ore in the State is mined chiefly in Plumas, Shasta, Calaveras, and Trinity counties and, with the exception of Trinity, these counties all increased their output in 1929. The output of lead in California decreased from 1,981,037 pounds in 1928 to about 1,274,000 pounds in 1929 and the value from \$109,680 to \$80,900. Mining of lead and lead-silver ores was not so active in 1929 as in 1928 and the number of miscellaneous shippers from Inyo and San Bernardino counties decreased. The small quantity of by-product zinc reported in 1929 came from the milling of lead-silver ore and probably did not exceed 50,000 pounds.

**FINANCE** State expenditures in the year ended June 30, 1928, as reported by the United States Department of Commerce, were for maintenance and operation of governmental departments, \$64,404,531 (of which \$24,100,162 was for local education) - for conducting public-service enterprises \$2,568,923, for interest on debt \$4,851,646, for permanent improvements \$17,216,047, total, \$81,031,147 (of which \$15,796,198 was for highways \$1,976,297 being for maintenance and \$10,819,901 for construction). Revenues were \$102,729,699. Of these, although no general property tax was levied in 1928, the category of property and special taxes furnished 19.3 per cent, departmental earnings and remuneration for officials' services, 6.5 per cent, license sales, 60 per cent (including gasoline taxation of \$15,447,544). The State debt, total \$116,159,817, net \$115,614,867, included \$64,725,000 for highways, but was exclusive of the State's contingent obligation for local drainage indebtedness assessable against benefited areas.

**TRANSPORTATION** The total number of miles of railroad line in operation on Jan. 1, 1929, was 8230.61. There were built in 1929, 113.69 miles of first, 11.90 of second, 1.62 of third, and 1.63 of fourth or other track.

**MANUFACTURES** According to the Federal biennial Census of Manufactures published by the U. S. Department of Commerce in 1929 and dealing with operations of 1927, there were in 1927, in the State 10,066 manufacturing establishments. These employed 262,816 wage earners, whose wages for the year totaled \$378,321,461. Materials and supplies used in production cost \$1,504,655,053. Manufactured products attained the combined value of \$2,593,947,224.

**EDUCATION** An important step toward the fuller organization of public education in the State was the action taken by the Legislature in codifying the school laws. The policy of the central educational authority was largely bent on organizing means to meet specific needs of individuals in the diverse stages of education.

The enrollment of pupils in the public schools of the State as of June 30, 1928 was Kindergarten, 77,139, elementary schools, 677,701, junior high schools, 97,886, high schools, 435,401, junior-college districts, 10,787. Current expenditures for public school education in 1927-28 were \$109,997,878 while capital outlay expenditures amounted to \$33,897,032. Salaries of teachers averaged Kindergarten, \$1745, elementary schools, \$1754, junior high schools, \$2302, high schools, \$2421, junior-college districts, \$2729.

**CHARITIES AND CORRECTIONS** Created in 1927, a State Department of Social Welfare cooperating with other institutional bodies, performed duties of inspection with regard to two State prisons, the county jails, six State hospitals, county hospitals, three training schools and numerous homes for children, the aged, and the disabled. Among the chief State institutions were Agnew State Hospital at Agnew, Industrial Home for the Adult Blind, Oakland, Mendocino State Hospital, Talhage, Napa State Hospital, Imola, Norwalk State Hospital, Norwalk, Patton State Hospital, Patton, Pacific Colony, Padra, Nonoma State Hospital, Eldridge; Stockton State Hospital, Stockton, Ventura School for Girls, Ventura; Whittier State School, Whittier, Preston School of Industry, Tione, State prisons at Folsom and San Quentin.

**LEGISLATION** The Forty-eighth State Legislature met in regular biennial session on January 7 and adjourned on May 15. Important fiscal measures were passed, including the tax difficulties that had arisen during the biennium. One of these was a bank and corporation income tax of 4 per cent, and another was a measure providing for the taxation of intangible securities and solvent credits. This enactment placed a tax of two mills to the dollar on the actual value of such intangible securities as notes, debentures, shares, bonds, trust deeds, and mortgages and a tax of one mill on solvent credits. As to the estimate of Senator Nelson, the bill, more than \$7,000,000,000 of intangible securities that had escaped taxation under earlier law would become available for taxation under the statute. It went into effect on the first Monday in March. The receipts from this tax were to go to the benefit of the counties. By enactment, the State inheritance tax was reduced, through the increase of exemptions and the diminution of rates. It was enacted, for the more general collection of the personal property tax, that those registering automobiles must present proof that they had paid taxes on their cars. A constitutional amendment proposition to the same purpose, provided for the collection of the county personal-property taxes on automobiles by the State.

Legislation was provided to commit the State to the obligations of the six-State compact for a Colorado River dam. In order to render the development of the State road system subject "to traffic pressure, not political pressure," a resolution provided for the States' abstention from any additions to its highway system until the Legislature of 1931 and for the survey of the road needs. In the meantime by the State Department of Public Works. A budget bill carrying \$244,968,253 of appropriations for the ensuing two years was enacted. In a new motor-vehicle code, a State police force was created for the specific purpose of enforcing the law as to automobile traffic, and this body became the effective arm for the maintenance of "uniform traffic" throughout the State, save for the where the local police forces maintained control. A series of measures provided for the construction of a bridge between San Francisco and Alameda counties and for the creation of a California Toll Bridge Authority to acquire and construct toll bridges. By statute, the permission was given to Alameda and San Mateo counties to unite through annexation by San Francisco, if both should so agree. A so-called 24-hour school law, which was enacted, authorized school districts to establish 24-hour schools where misbehaving children might be kept all the time, either upon the request of parents or by court order. An unusual law reaching the statute books was that requiring firms that collected percentages of their employees' tips to post public notice of the fact. A measure authorizing a \$10,000,000 bond issue for the improvement of San Francisco Harbor was passed. Legislation was passed to promote more orderly development of oil fields by cooperation among operators.

The State Attorney General reached and tried Superior Judge C. C. H. of Los Angeles on a charge of misconduct in office. The charge dealt with his alleged receipt of a gift of \$2500 from the evangelist, Aimee Semple McPherson, at a time when she was herself facing legal proceedings with

regard to a sensational matter. The Judge was impeached by a vote of 57 to 18 in the Assembly. After a trial that aroused much popular excitement, the Senate acquitted him.

**POLITICAL AND OTHER EVENTS** A new law for the curtailment of waste of natural gas at wells within the State went into effect in June, but its full enforcement was expected to become possible only after a lapse of time, to allow producers to set up the means of re-pressuring and storing escaping gas. Suit was brought to trial in October to invalidate the law on behalf of operators who were bound, it was alleged, by their leases to continue drilling, a proceeding incompatible with observing the law. The overproduction of petroleum and likewise of natural gas prompted the movement in the State to limit the output of both commodities. With regard to petroleum, the so-called Kettleman Hills agreement of 1928, limiting and prorating the output of the Kettleman Hills field, continued in force, with the support of favorable legislation of the session of 1929. Restrictions, however, did not prevent the rise of the State's petroleum production to a new daily average of nearly 880,000 barrels in July. The State government made unavailing efforts to reach an agreement with Arizona such as would permit of the construction of the Federal dam on the Colorado River, much desired by Los Angeles and the southern California interests. The construction of State buildings for a new Teachers' College at San Diego, to cost \$640,000, was begun in October.

Although the State's Wright Act, provided for the automatic acceptance into the State's prohibition law of any subsequent amendments of the Federal Prohibition Enforcement Law, the Federal Jones Law was declared inapplicable in California, by decision of a Superior Court judge in Orange County. He held that, as the State constitution vested the lawmaking power in the Legislature, it could not divest itself by delegating to the Federal Legislature the power to make laws that would automatically apply in the State. By decision of the State Supreme Court, the execution of five convicts held responsible for the murder of 18 persons in the outbreak at the Folsom State prison on Thanksgiving Day, 1927, was ordered, after protracted legal process.

Desire to tap the State's traffic prompted endeavors of certain railroads to extend their lines into its territory, but such efforts were opposed in the courts and before the Interstate Commerce Commission, notably in the case of the Great Northern system's project to build into northern California and in track construction of the Southern Pacific near San Mateo, threatening to parallel the Western Pacific. The year was an unusually dry one, and this condition had the effect of intensifying the water shortage barrier across the upper part of the bay. Bay to shut out the salt water which, owing to the lack of fresh water discharge from the Sacramento River, invaded the irrigation ditches of the Sacramento Delta. Grape shippers were affected by a District Court of Appeals decision overthrowing a law of 1927 to regulate the size of containers for their product. An active State campaign against the entrance of the Mediterranean fruit fly into California was maintained.

A leading interest of San Francisco, that of connecting the city with the mainland by a series of bridges, made progress by the completion on March 2 of the San Francisco Bay Bridge. This

structure crosses the Bay between a point east of San Mateo and the mainland shore near Mount Eden. It is 7.1 miles long, cost approximately \$7,500,000, and was constructed by a private company as a highway toll bridge. With regard to two bridges between the mainland and San Francisco proper, the projected Golden Gate Bridge and Alameda Bridge, conferences were held with Federal authorities, but the objections of the latter on the score of difficulty to navigation that might ensue were maintained. President Hoover and Governor Young jointly selected a San Francisco Bay Bridge Commission to conduct a survey of the subject. The Pacific Gas and Electric Company started in February the construction of a 250-mile pipe line to convey natural gas to the bay region from Kern County.

The transit problem of Los Angeles dealt with by the State Railroad Commission, which ordered a prolongation of the temporary system of experimental fares on the Pacific Electric Railway lines, but allowed increases in some of the fares previously applied. The commission moved to appeal to the United States Supreme Court against the decision rendered by a Federal District Court in October, 1928, allowing the Los Angeles Railway to collect a seven-cent fare. The Los Angeles Board of Education voted to build a junior college. A factory of the Fokker Airplane Company and a \$1,500,000 automobile assembly plant were opened within the Los Angeles industrial district.

OFFICERS: Governor C. C. Young, Lieutenant-Governor, H. L. Canham, Secretary of State, Frank C. Jordan, Treasurer, Charles G. Johnson, Comptroller, Ray L. Riley, Attorney-General, U. C. Webb, Adjutant-General, Richard R. Mittelstaedt, Surveyor-General, W. S. Kingsbury, Superintendent of Public Instruction, William J. Cooper, Director of the Department of Education, G. H. Hecke.

JUDICIAL: Chief Justice William H. Waste, Associate Justices, William H. Langdon, John W. Preston, Jesse W. Curtis, Emmet Sewell, John E. Richards, John W. Shoup.

**CALIFORNIA, UNIVERSITY OF.** A coeducational institution of higher learning in Berkeley, Calif., with branches in various parts of the State. University of California at Los Angeles, with the colleges of letters and science and education, branch of the college of agriculture at Davis, citrus experiment station and graduate school of subtropical horticulture at Riverside, Scripps Institution of Oceanography at La Jolla, Lick Observatory at Mount Hamilton, and agricultural stations near San José and Corona and in the Imperial Valley. The number of full-time resident students in courses leading to degrees on Nov. 1, 1929, was 16,827, of whom 8339 were men and 8488 were women. The enrollment in the university extension division in 1928-29 was 38,583 in classes and 5805 in correspondence courses. At the beginning of the autumn term, there were approximately 2000 members on the regular teaching staff and 700 on the extension staffs. The endowment funds for 1928-29 amounted to \$14,312,551, while the income from them was \$601,926. The total income for the year was \$14,906,790, gifts totaled \$2,128,310. The library contained approximately 1,100,000 volumes.

During the summer of 1929, the colleges in Los Angeles moved to the new site of the university,

consisting of 365 acres on which had been erected five buildings at a cost of \$3,250,000. On the Berkeley campus, the Life Science Building was completed at a cost of approximately \$2,000,000. Buildings under construction, to be completed in 1930, included Kerckhoff Hall, a student union at Los Angeles, estimated to cost \$500,000, Gannin Hall for the college of agriculture, \$500,000, a student infirmary, above \$500,000, a civil engineering building, \$400,000, and the International House, \$1,500,000. William Wallace Campbell, Sc.D., LL.D., president of the university, announced at commencement, 1929, his retirement to take effect July 1, 1930. He was to be succeeded at that time by Robert Gordon Sproul, B.S., LL.D., vice president of the university.

**CAMBODIA.** A French protectorate of Indo-China lying to the north of Cochin-China, west of Annam, and south of Laos and Siam. Area, 67,550 square miles, population at the census of 1926, 2,535,178, of whom 1901 were Europeans (excluding the military forces). Phnom-Penh, with a population of 81,712, is the capital and chief town. There are 171 French schools, including one college and one professional school, with a total of 12,000 pupils. In 1927 there were 1209 miles of good metalled roads and 1160 miles in course of construction. The soil is very fertile, but only a comparatively small area is under cultivation. The chief product is rice, its annual export amounting to about 250,000 tons. The other products include cotton, pepper, kapok, salt fish, hides, cattle, coffee, sugar, and iron. The imports of 1926 were valued at 68,009,173 francs and the exports, at 26,253,000 francs. The budget for 1928 balanced at 11,839,969 piastres. Norodom King, Monivong, who succeeded his father Aug. 9, 1927. Cambodia is one of the five component states of French Indo-China. It is famous for its ruins of ancient civilizations, particularly those of Angkor. See FRENCH INDO-CHINA.

**CAMEROON** OR **CAMEROONS**. See KAMFRUN.

**CAMP FIRE GIRLS.** An organization primarily for the adolescent girl. Its purpose is "to seek beauty, give service, pursue knowledge, be trustworthy, hold on to health, glorify work, and be happy." The programme evolved to carry out these aims has been planned to take care of the out-of-school time of girls. It makes use of symbolism, ceremony and ritual and includes practically every wholesome activity which would naturally engage the interest of the young girl. Each girl, upon joining, selects a name for herself which expresses some ambition or ideal. The activities of Camp Fire are grouped under the seven crafts, which form the basis of the system of honors and awards. Home, health, hand, camp, nature lore, business and patriotism and citizenship. Distributed among these crafts are about 700 honors which the girl may earn as steps toward the winning of the three progressive ranks. The rank of wood gatherer typifies loyalty to organization and group, of fire maker, the ideal of wider loyalty to mankind and God, and of torch bearer, the highest rank, the desire to pass on undimmed to others that light which has been given to her. All symbolize the taking on of certain responsibilities and the carrying out of certain desires.

As a special project for 1929, Camp Fire girls planted gardens and flowers to grow in their homes. Interest in garden making led to many related activities, such as beautifying unsightly

spots in the community; planting, caring for, and cultivating service gardens for hospitals, schools, and playgrounds, making wild-flower gardens at camp, holding flower shows and exhibits of wild flowers; advocating the conservation of wild flowers, and growing flowers for shut-ins and for sale. The interest aroused in such a special ventily project carries over into the general programme of the following year. The 1927 project, for instance, which resulted in the planting of more than 200,000 trees by Camp Fire girls, led to the adoption of a permanent national honor for planting trees

3,542,049 square miles, of which 560,000 square miles is suitable for agricultural or pastoral purposes. The water area is 142,674 square miles. Canada consists of nine provinces, each with its own parliament and administration, and two territories, viz., the Northwest Territories and Yukon Territory, each under a commissioner, assisted by a council. According to the census of 1921, the total population was 8,788,483, as compared with 7,206,643 in 1911.

The accompanying table shows the areas of the provinces, etc., and the population at recent censuses.

AREA AND CENSUS POPULATIONS

Province	Land area sq. miles	Water area sq. miles	Total area sq. miles	Population, 1901	Population, 1911	Population, 1921
Prince Edward Island	2,184		2,184	109,259	98,728	88,615
Nova Scotia	21,088	360	21,128	459,574	492,378	521,877
New Brunswick	27,911	71	27,985	311,120	351,889	387,870
Quebec	690,865	15,969	706,834	1,048,898	2,005,776	2,361,190
Ontario	365,880	41,982	407,262	2,127,947	2,527,292	2,933,662
Manitoba	231,926	19,406	251,832	255,211	461,394	610,118
British Columbia	243,381	8,319	251,700	178,657	392,480	524,582
Alberta	252,925	2,360	255,285	77,022	374,295	588,454
Saskatchewan	353,416	2,439	355,855	91,279	492,432	757,510
Yukon	206,827	649	207,076	27,219	8,512	4,157
Northwest Territories	548,522	7,500	556,022			
	218,460	9,700	228,160	20,129	6,507	7,988
Royal Canadian Navy	493,225	74,265	527,490			485
Total	3,654,200	142,921	3,797,123	5,271,115	7,206,643	8,788,483

In 1928 Camp Fire girls made and donated thousands of garments to the American Red Cross and the Needlework Guild to replenish their emergency supplies which had been depleted by the catastrophes of the year. The Needlework Guild reported that continued interest was aroused during 1929 in making garments for that organization.

The membership of the organization in 1928 was approximately 208,078, including 157,982 Camp Fire girls and guardians and 32,284 Blue Birds, the youngest members. During the school year of 1927-28 and the summer of 1928, 103 Camp Fire training courses were given in colleges, universities, and normal schools or conducted independently. There was a registered enrollment of 2847, with 2054 graduates. During the summer of 1929, 16,000 Camp Fire girls attended more than 100 class camps (camps having an attendance of 25 or more), while thousands of others went camping in small groups with their leaders.

At the National Council of Camp Fire Girls which met Sept. 5-7, 1929, at Omaha, Neb., Miss Florence Hughes was elected president, Jay B. Nash of New York, first vice president, Dr. Joseph Ravecroft of Princeton, N. J., second vice president, Dr. Myron T. Sandler of New York, treasurer, and Lester F. Scott, secretary and national executive. The organization publishes *Etiquette*, a monthly magazine for girls, and *The Guardian*, a resource for guardians, which is published monthly except during July and August. The national headquarters are at 41 Union Square, New York City.

**CANADA.** A dominion of the British Empire in North America bounded on the north by the Arctic Ocean, on the south by the United States, and on the east and west by the Atlantic and the Pacific oceans, respectively. Capital, Ottawa.

**AREA AND POPULATION.** The total land area of Canada, revised according to the Labrador Boundary Award of 1927, was estimated at

The population of Canada as estimated by the Dominion Bureau of Statistics was 9,706,800 on June 1, 1929. By provinces and territories, the population was estimated as follows: Prince Edward Island, 86,100; Nova Scotia, 550,400; New Brunswick, 419,300; Quebec, 2,600,400; Ontario, 3,271,300; Manitoba, 663,200; Saskatchewan, 866,700; Alberta, 646,000; British Columbia, 591,000; Yukon Territory, 3000; and Northwest Territories, 9400. The figures include about 105,000 Indians and about 6000 Eskimos widely scattered throughout northern Canada. More than 55 per cent of the population is of British origin, 28 per cent is of French origin and other European stocks constitute slightly over 14 per cent. The proportion of British stock is highest in Ontario and the Maritime Provinces, of French stock, in Quebec and New Brunswick, and of other European stock, in the prairie provinces.

The principal cities with populations in 1921 and in 1927 (in parentheses) were Montreal, 618,506 (989,835); Toronto, 521,893 (556,691 in 1926); Winnipeg, 179,087 (198,932); Vancouver, 117,217 (128,350); Hamilton, 114,151 (123,359 in 1926); Ottawa, 107,843 (125,496 in 1929); Quebec, 95,193 (131,071); Calgary, 63,305 (72,500); London, 60,919 (64,293 in 1926); Edmonton, 58,821 (67,083); Halifax, 58,372; St. John, N. B., 47,166 (60,000); Victoria, 38,727 (38,750); Windsor, 38,601 (61,095 in 1926).

The accompanying table from the *Canada Year Book* for 1929 shows the vital statistics of the population for recent years.

Immigrants entering Canada during the year ending Mar. 31, 1929, numbered 167,722, of which 58,880 came from the United Kingdom, 30,560 from the United States, and 78,282 from other countries. Canadians returning from the United States during the same year numbered 33,798. The U. S. State Department announced in February, 1929, that of the 392,068 Americans resident abroad, two-thirds were in Canada. Immi-

## SUMMARY OF BIRTHS, MARRIAGES, AND DEATHS

	Years	Births	Birth rate per 1000	Marriages	Rate per 1000	Deaths	Rate per 1000	Excess of births over deaths	Rate natural increase per 1000 population

Up to the end of 1928, 2669 families, comprising 14,916 persons, had been settled in Canada under the Empire Settlement Act.

with the provinces contain the latest available statistics on education for those provinces. Statistics for Canada as a whole are given in the accompanying table. In the academic year ending in 1927, there were 2,291,763 pupils in attendance at Canadian educational institutions, or 24.1 per cent of the estimated population of the Dominion in 1927.

Higher education in Canada is carried on in 23 universities and 85 colleges, including 22 classical colleges in Quebec. Of the universities, six are state controlled (New Brunswick, Toronto, Manitoba, Saskatchewan, Alberta, and British Columbia), four are un denominational (Dalhousie, McGill, Queen's, and Western), while the remainder are denominational. The 23 universities had 4126 professors, etc., and 42,546 students in 1926-27 and the 85 colleges had 19,678 students enrolled in the same year. Some of the better known denominational colleges include Kings, Acadia, and St. Francis Xavier in Nova Scotia, Mt. Allison in New Brunswick, Laval and Bishop's College in Quebec, and McMaster and Ottawa in Ontario.

## DOMINION OF CANADA EDUCATIONAL STATISTICS—1927

Provinces	Year Ended	Schools *	Teachers	Pupils	Expenditure Dollars

\* Where possible the number of schoolhouses is given, and elsewhere the number of school districts with schools in operation

The religious denominations in the order of their numerical importance in 1921 were Roman Catholics, Presbyterians, Anglicans, Methodists, Baptists, Lutherans, the Greek Church, Jews, Mennonites, and Cong. Of these, 3,389,636 were Roman, 9,407 Presbyterians, 1,407,994 Anglicans, and 1,159,458 Methodists. See CANADA, UNITED CHURCH OF.

EDUCATION The control of education in the Dominion of Canada is directly in the hands of the provinces. The individual articles dealing

AGRICULTURE In 1927, 58,586,425 acres were devoted to all field crops, the area being about 3 per cent of Canada's land surface, and about 9,308,000 acres to pasture. The value of all agricultural crops in 1928 was \$1,730,304,000, or 2.8 per cent less than in 1927. The principal reductions were due to declines in the value of field crops (principally grains) and in tobacco. Agricultural revenue by provinces, in the order of their importance, was as follows: Ontario, \$500,821,000; Saskatchewan, \$392,603,000; Quebec,

\$277,050,000, Alberta, \$264,028,000, Manitoba, \$148,807,000, British Columbia, \$50,715,000, Nova Scotia, \$40,162,000, New Brunswick, \$34,307,000, and Prince Edward Island, \$21,750,000. Increased revenue was reported for Nova Scotia, New Brunswick, Manitoba, and British Columbia. The gross agricultural wealth of Canada for 1928 was estimated at about \$8,027,801,000, an increase of \$19,353,000 over the previous year. The area, production, and yield per acre for the principal crops in 1928 is shown in the accompanying table.

CROPS AREA, PRODUCTION, AND YIELD PER ACRE

Crop	Area (thousands of acres)				Production (thousands of units—bushels, except as indicated)				Yield per acre (bushels)	
	1909-13	1923-27	1927	1928	1909-13	1923-27	1927	1928	1923-27	1928

<sup>a</sup> 1910-1913

<sup>b</sup> Unit, short ton

<sup>c</sup> Unit, hundredweight

The Dominion Bureau of Statistics estimated (July, 1929) that the total area sown to field crops, exclusive of grain hay, for 1929, was 58,223,400 acres, as compared with 57,796,226 acres in the previous year. Wheat acreage increased by 1 per cent over 1928, barley by 6 per cent, oats showed little change, and the rye, flaxseed, and potato acreage declined.

The 1929 crop, however, was much less satisfactory than in 1928. A drought throughout a large part of the prairie provinces materially decreased the yield of wheat, oats, barley, and other grain crops, as well as the root and fodder crops. The value of field crops was placed at \$986,986,000 by a government estimate dated December 13. This total is more than 12 per cent below that recorded for the previous year. The principal crops, with their estimated values in 1929 and in 1928, were, wheat, \$345,840,000 (\$451,235,000), oats, \$169,951,000 (\$210,956,000), barley, \$62,448,000 (\$76,112,000), and potatoes, \$69,963,000 (\$40,874,000). The significant feature of the government report is the higher average price of wheat, given as \$1 18 per bushel in 1929 against 80 cents for 1928. An official estimate placed the total area sown to the principal field crops in 1929 at 59,607,034 acres, against 57,796,226 acres in 1928. The 1929 wheat acreage was calculated at 25,255,002, as compared with 24,119,140 in 1928, oats, 12,479,477 (13,136,516), barley, 5,925,542 (4,880,740), rye, 991,944 (839,365), and flaxseed, 382,359 (378,081). The potato acreage was only 543,727, against 599,063 for 1928, sugar beets, 43,404 (51,294). The good quality of the grain and higher prices were expected to counterbalance, to some extent, the lowest yield since 1924. The estimated yield of wheat in 1929 was 289,520,000 bushels, as against 566,726,000 in 1928, of potatoes, 44,888,000 hundredweight, or 11 per cent less than in 1928.

The total value of products of dairy factories in 1928 was \$144,543,740, an increase of 6 per cent over the output for the previous year. The industry is concentrated to a considerable extent

in Ontario and Quebec. Dairy factory products in 1928 were creamery butter, 170,355,975 pounds, valued at \$65,540,177, factory cheese, 143,089,794 pounds, \$30,313,879, condensed, evaporated, and powdered milk, \$10,266,415, miscellaneous products, \$38,463,209. In 1927 there were 2899 dairy factories in Canada.

FRUIT FARMING. Many portions of Canada are well adapted for this industry, the best known being located in Nova Scotia, New Brunswick, Ontario, and British Columbia. Of orchard fruits, apples are most important, and in number of trees

and quantity of production greatly exceed all others combined, although peaches, pears, plums, cherries, and small fruits are grown in abundance. Extensive vineyards also exist. According to the *Canada Year Book* for 1929, the production of the more important fruit in 1927 was as follows: apples, 2,810,600 barrels, valued at \$10,411,035, pears, 332,200 barrels, \$603,730, peaches, 347,580 barrels, \$1,051,767, strawberries, 10,940,200 quarts, \$1,516,145, grapes, 34,560,000 pounds, \$1,382,400. The 1929 commercial apple crop was estimated at 3,702,370 barrels, or 11 per cent more than in 1928. Estimates placed the 1929 grape crop at 59,000,000 pounds, or about 28 per cent less than in 1928.

The livestock census for June, 1927, showed 9,172,000 cattle, 3,421,857 horses, 3,262,706 sheep, 4,094,789 swine, and 50,178,485 poultry. Eggs produced in 1927 were valued at \$80,110,010. The wool clip in the same year totaled 18,672,766 pounds valued at \$4,108,000, and in 1928 approximately 19,611,430 pounds, valued at \$5,099,000. In 1929 wool production was estimated at 21,234,000 pounds, valued at about \$4,247,000.

The maple sugar and sirup production in 1928 was valued at \$5,584,588 and in 1927, at \$4,934,811, beet sugar (1927), \$3,094,303, tobacco (1927), \$9,112,278. The value of dairy production for 1928 was, field crops, \$1,000, farm animals, \$183,927,000, dairy products, \$245,494,000, poultry and eggs, \$97,337,000, fruits and vegetables, \$46,025,000, miscellaneous, \$28,863,000, total, \$1,736,439,000. This was about \$500,000,000 less than in 1927.

FISHERIES. In addition to an immense salt-water fishing area Canada has approximately 220,000 square miles of fresh water abundantly stocked with many species of excellent food fish. The Dominion Bureau of Statistics stated the value of production of the fisheries of Canada for the year 1927 as \$49,497,038. Preliminary estimates placed the 1928 production at \$54,000,000. The value of fishery products, including seal skins and fish oils, exported in 1928, was \$35,660,287, as compared with \$36,355,464 in 1927.

**FORESTS** It has been officially estimated that the total area of land covered by forests is 1,151,454 square miles. Less than 40 per cent of this area, however, is covered with commercial timber. The most important timber areas are in Northern Ontario, Quebec, and British Columbia. In 1928 29 the value of wood, wood products, and paper exported was \$288,621,745, most of which went to the United States.

**FUR INDUSTRY** Canada ranks third as a raw-fur-producing country, being exceeded only by the United States and Russia. The more important animals raised on fur farms are foxes, mink, beaver, mink, marten, coyotes, karakul sheep, and skunks. In 1926 there were 2523 fox farms and 185 other fur farms in Canada. During the fiscal year ending March, 1928, furs exported to the United States were valued at \$14,335,751 (\$12,943,010 in 1927), and to Great Britain, \$9,185,200 (\$7,275,671 in 1927). The total fur exports were valued at \$24,315,244 in 1928 and \$20,608,687 in 1927.

**MINERAL PRODUCTION** New mineral production records, established in 1926 and 1927, were surpassed in 1928 when the value of the output of all Canadian mines reached \$273,446,864, a gain of \$26,090,169, or nearly 10 1/2 per cent more than the output for the previous year. Increased production was recorded in all mining fields—metals, non-metals, fuels, and structural materials, according to the Dominion Bureau of Statistics. New output records were established for cadmium, copper, gold, lead, nickel, metals of the platinum group, zinc, cement, coal, gypsum, lime, salt, and stone. The value of natural gas and petroleum produced was also higher than for any previous year. The value of Canada's mineral production by classes is shown in the accompanying table.

VALUES OF MINERAL PRODUCTION OF CANADA BY CLASSES, 1907, 1912, 1917, AND 1923-1928

Year	Nonmetallic			Total
	Metallic	Fuels and other non-metallics	Structural materials and clay products	
1907	\$ 42,426,607	\$31,275,546	\$12,861,049	\$ 86,865,202 *
1912	61,172,753	45,080,674	28,799,869	135,048,296
1917	106,455,147	63,354,363	19,837,311	189,646,821
1922	61,785,707	84,976,794	39,554,741	186,297,242
1923	84,391,218	91,936,742	17,751,381	214,079,341
1924	102,406,528	71,796,009	35,380,869	209,583,406
1925	117,082,298	71,851,801	37,649,234	226,583,333
1926	115,237,581	85,240,114	39,959,198	240,437,121
1927	113,135,582	88,498,024	12,886,492	244,520,098
1928	131,904,603	91,660,026	49,882,235	273,446,864

\* Total includes \$300,000 allowed for products not reported.

In 1929 mineral production broke all previous records with an estimated aggregate value of \$303,876,000, or 10 1/2 per cent larger than in 1928. The output of copper was 242,401,009 pounds, valued at \$43,362,000, nickel, 109,200,000 and \$25,700,000, crude petroleum, 1,132,800 barrels, \$3,945,000. The petroleum production in 1928 was 624,184 barrels.

Mineral production by provinces in 1928 was as follows: Nova Scotia, \$29,757,010 (10.88 per cent of total), New Brunswick, \$2,257,653 (0.83 per cent), Quebec, \$37,182,804 (13.60 per cent), Ontario, \$99,628,506 (36.43 per cent), Manitoba, \$4,119,516 (1.51 per cent), Saskatchewan, \$1,536,965 (0.56 per cent), Alberta, \$32,367,781 (11.81 per cent), British Columbia, \$63,913,159 (23.37 per cent), Yukon, \$2,683,270 (0.98 per cent). Canada's mining industry had a capital

investment of more than \$700,000,000 and employed about 85,000 workers in 1929. The airplane was coming into extensive use in connection with prospecting and mining activities in northern Canada. The opening of new mines and extension of existing properties was expected to result in an increase of approximately \$100,000,000 in the aggregate mineral production in 1930, as compared with 1929.

**MANUFACTURES** The value of Canadian manufactures increased markedly since 1921, as is shown in the accompanying summary of manufacturing statistics. The ten leading manufacturing industries are pulp and paper, flour- and grist-mill products, slaughtering and meat packing, sawmills, butter and cheese, automobiles, electric light and power, rubber goods, cotton yarn and cloth, and sugar refineries.

The capital investment in manufacturing in 1927 amounted to \$4,337,631,558, an increase of 8.94 per cent over that for 1926, and the total cost of materials used was \$1,789,574,604, an increase of 3.52 per cent for the year. Gross production by provinces in the same year was Ontario, \$1,758,004,575, Quebec, \$990,582,965, British Columbia and Yukon, \$246,034,704, Manitoba, \$112,089,678, Alberta, \$84,987,317, Nova Scotia, \$74,458,297, New Brunswick, \$72,666,665, Saskatchewan, \$72,180,681, Prince Edward Island, \$1,493,628.

Exports of fully or chiefly manufactured products in the fiscal year ending Mar. 31, 1928, amounted to \$458,796,551 and exports of partly manufactured products, to \$189,381,449. The pig-iron and primary steel output of Canada in 1928 was the highest in 10 years.

The Canadian iron and steel industry in 1928 included 1159 plants, representing a capital investment of \$702,931,188, employed an average of

119,200 persons and had a total output valued at \$609,632,999. The foregoing figures cover not only primary products but all products in which iron and steel are employed. Five industries had a production value of more than \$50,000,000, automobiles, \$162,067,495, castings and forgings, \$81,904,852, railway rolling stock, \$73,422,057; primary iron and steel, \$62,071,674, and machinery, \$51,046,140. Pig-iron production was 1,037,555 long tons, 46 per cent more than in 1927, and the output of steel ingots and direct steel castings was 1,240,211 tons, a 37 per cent increase over 1927. Coke production in 1928 was 2,308,127 tons, or 14 per cent more than in the previous record year of 1926. Production in these lines was stimulated by an increased demand for rails and other track equipment and greater requirements for construction, mining, power develop-

## SUMMARY OF STATISTICS OF MANUFACTURES

Year	Estab- lish- ments	All em- ployees	Wage- earners	Value of products thousands of Canadian dollars	Value added by manufac- ture, thou- sands of Canadian dollars	Primary horse power, thousands
1910*	19,218	515,203		1,185,976	564,467	
1917	22,838	621,494	552,968	2,873,268	1,312,181	2,889

1927	22,936	618,933		3,425,498	1,635,921	5,328

\* Establishments with 5 hands and over, all establishments for other years shown

ment, and the manufacture of automobiles and agricultural implements. Newsprint production in 1928 was 2,380,000 tons, nearly 300,000 tons more than in 1927. Despite a marked decline in the last quarter, the volume of Canadian production reached a new high level in 1929. Pignion production reached 1,090,244 tons, or 5 per cent more than in 1928, and the output of steel ingots and direct steel castings 1,379,688 tons, an 11 per cent increase. News print production increased by 15 per cent to 2,728,827 tons, and total shipments rose by 14 per cent to 2,722,381 tons.

About 550,000 additional horse power was added to the total available for Canadian industry in 1928 as a result of new works or additions to existing power plants. Other power developments projected or under construction will add 1,200,000 horse power in the next few years. Among all countries Canada ranked next to the United States in the amount of developed water power, and the hydroelectric current generated was greater per capita than in the United States. On Jan. 1, 1929, the potential capacity of water powers at ordinary minimum flow was estimated at 20,197,000 horse power. The capacity of installed water turbines was 5,349,232 horse power, as compared with 975,000 in 1910 and 2,508,000 in 1920. Considerable quantities of electric current were exported from Canada to the United States, the amount in 1928 being 1,674,850,007 kilowatt-hours. A large proportion of factory machinery is operated by electricity.

Prices of commodities in Canada were lower in 1928 than in either 1926 or 1927. According to the new index of the Bureau of Statistics with 1926 as the base equaling 100, the price level in 1928 was 12 per cent lower than in 1927 and 3.5 per cent lower than in 1926.

The glass, clay, stone, structural iron and steel, and other industries manufacturing construction materials were stimulated by active urban building during 1928. Building permits issued in 63 cities during the year involved the expenditure of \$219,000,000 as compared with \$184,000,000 in 1927.

COMMERCE. During the fiscal year ending Mar. 31, 1929, imports and exports totaled \$2,654,452,166, the preliminary statement of the Department of National Revenue. This was an increase of 12.6 per cent over the preceding year and was greater than in any similar period in the history of the Dominion. Wheat exports increased in quantity by 103,600,000 bushels, or 39 per cent, and in value by \$70,400,000, or 21.6 per cent. Exports of wheat flour were in excess of the 1927 total by \$5,200,000 and exports of newsprint by \$13,800,000. Exports

of wood pulp, planks and boards showed a decline, while those of automobiles and parts increased nearly 66 per cent, the total value being \$45,400,000. The gain in imports was considerably greater than the gain in exports, reducing the favorable balance of trade from \$141,500,000 in 1927-28 to \$124,500,000 in 1928-29. Imports and exports, by industrial groups, for 1928-29 are shown in the table on page 145.

For the calendar year 1928, imports into Canada totaled \$1,222,317,916, a 12.5 per cent increase over 1927 imports, and exports totaled \$1,349,751,103, an increase of 10.8 per cent. Domestic exports, however, were \$23,950,000 less than in 1927. Imports of iron and steel manufactures for the year were valued at \$74,800,000, or 30 per cent more than in 1927. Canadian purchases of nonferrous metal and animal products increased by 15 per cent and wood and paper imports were 13.7 per cent greater than in 1927. In the calendar year 1929, imports totaled \$1,298,893,000, an increase of 6.2 per cent over 1928, and exports, \$1,182,412,313, a decline of 12 per cent.

TRADE WITH THE UNITED STATES. The United States took 38.9 per cent of Canada's exports and supplied 64.9 per cent of her imports in 1928, as compared with 37.2 per cent of the exports and 66.7 per cent of the imports in the previous year. The value of Canadian exports to the United States was \$478,006,000 in 1928, an increase of \$11,583,000 over 1927, and the value of Canada's imports from the United States in the same year was \$719,444,000, an increase of \$32,421,000 over 1927. In 1929 imports from the United States increased by 8.2 per cent to \$893,606,685 and exports to that country increased by 6.2 per cent to \$522,585,557.

Expenditures by American tourists in Canada, estimated at over \$250,000,000 in 1928, comprised an important "invisible" item in the Dominion's balance of trade. The estimated expenditures of American motorists alone in 1928 in the several provinces were: Maritime provinces, \$6,089,000, Quebec, \$43,915,000, Ontario, \$95,680,000, Prairie Provinces, \$4,169,000, British Columbia, \$17,531,000. In 1927 expenditures by Canadian tourists in the United States and other countries were estimated at \$103,782,000. A total of 4,508,898 foreign automobiles, mostly American, entered Canada on tour in 1929, an increase of 863,353 cars over 1928. All tourist expenditures in Canada in 1929 were estimated at about \$300,000,000.

OTHER FOREIGN TRADE. The United Kingdom ranks next to the United States as Canada's principal customer, the value of Canadian products to the value of \$1,000,000,000 in 1928. This was

## IMPORTS AND EXPORTS OF THE DOMINION OF CANADA BY INDUSTRIAL GROUPS, FOR FISCAL YEAR ENDED MARCH 31, 1929

[From The Canada Year Book, 1929]

## Dominion Bureau of Statistics

IMPORTS	
<i>Industrial Groups</i>	
Agricultural and vegetable products	\$ 213,130,244
Animals and animal products	71,661,774
Fibres, textiles and textile products	206,444,011
Wood, wood products and paper	59,214,818
Iron and its products	316,610,939
Non ferrous metals and their products	75,418,471
Nonmetallic minerals and products	160,964,271
Chemicals and allied products	37,721,046
Miscellaneous commodities	68,491,581
Total imports	\$1,265,679,091
Total dutiable imports	\$821,075,430
Total free imports	444,603,661
Duty Collected	\$200,479,264
 EXPORTS	
<i>Industrial Groups</i>	
Agricultural and vegetable products	\$ 616,514,058
Animals and animal products	158,737,272
Fibres, textiles and textile products	9,678,019
Wood, wood products and paper	288,621,715

Total exports	\$1,388,733,073
Grand total external trade	\$2,651,452,166

\$36 169 000 less than in 1927. Imports from the United Kingdom in 1928 totaled \$185,889,000, a gain of \$21,950 000 over the previous year. Other leading purchasers of Canadian exports in 1928 were Germany, the Netherlands, Japan, Belgium, Italy, and Australia, in the order named. After the United States and the United Kingdom, the ranking countries supplying Canada's imports in the same year were France, Germany, Japan, Belgium, Argentina, and British India. Canada sold 40.7 per cent of her exports to other members of the British Empire in 1928 and purchased but 22.5 per cent of her imports from them. The United States and the United Kingdom together took 72.1 per cent of the Dominion's exports. The declared value of Canadian exports increased by 284.5 per cent between 1914 and 1928 while the volume of exports increased by 201.5 per cent. On the other hand, while the declared value of 1928 imports was 180 per cent greater than in 1914, the actual volume of 1928 imports was only 151.7 per cent greater.

**FINANCE.** For the fiscal year ending Mar 31, 1929, the Minister of Finance estimated that revenues would total \$454,942,000 and expenditures, \$385,160,000, leaving an apparent surplus

of \$69,782 000. The decrease in revenue from tax and tariff reductions authorized in 1928 was calculated at about \$25 000 000. The budget estimate for expenditures was \$373 796 856. Budget estimates for 1929-30 amounted to \$391 507,840. Despite the tax reduction, income tax payments for the year 1928-29 were \$59 422,297, a 5 per cent increase over those for the preceding year. Tax districts where the receipts increased were Halifax, Nova Scotia, Montreal, Quebec, Toronto, Ontario, Winnipeg, Manitoba, Saskatoon, Saskatchewan, Edmonton, Alberta. Decreases were recorded for Saint John, New Brunswick, Regina, Saskatchewan, Calgary, Alberta, and Vancouver, British Columbia. Some of the western declines were attributed to the creation of two additional tax districts at Saskatoon and Edmonton.

Customs and excise collections at Montreal during 1928-29 were \$105,462,183, an increase of \$5,707,061 over the previous year. For Toronto, they were \$67,050,172, as compared with \$63,795,970 for the previous year. Total import duties for 1928-29 amounted to \$200,479,264. On Mar 31, 1929, the net public debt stood at \$2,215,504,705, representing a reduction of \$81,345,528 dur-

ing the fiscal year. On Dec. 31, 1929, the net debt was \$2,159,214,730, as compared with 2,218,603,434 on the same date in 1928.

In 1927 the national wealth of Canada was \$27,687,000,000 and the per-capita wealth was \$2909, according to estimates of the Dominion Bureau of Statistics. The distribution of the national wealth by provinces and population is given in the accompanying table. Figures for the Yukon and the Northwest Territories have been purposely omitted. For finances of provinces, see articles on each.

## NATIONAL WEALTH OF CANADA, BY PROVINCES AND POPULATION—1927

Province	Estimated wealth	Estimated population June 1, 1927	Percentage of population	Percentage distribution of wealth
Prince Edward Island	\$148,493,000	86,700	0.91	0.53
Nova Scotia	857,129,000	543,000	5.70	1.10
New Brunswick	751,818,000	431,000	4.32	2.71
Quebec	6,852,279,000	2,604,000	27.16	21.75
Ontario	9,560,775,000	3,187,000	33.48	31.53
Manitoba	1,925,156,000	647,000	6.80	6.95
Saskatchewan	2,998,055,000	816,000	8.78	10.81
Alberta	2,258,210,000	617,000	6.48	8.16
British Columbia	2,118,651,000	575,000	6.04	8.18

SHIPPING. On Jan. 1, 1928, ships on the registry of Canada numbered 8454, with a tonnage of 1,368,000. For the fiscal year ending Mar. 31, 1928, 20,903 seagoing vessels of 21,240,847 tons entered and 20,700 vessels of 23,973,787 tons cleared. Vessels in coast-wise service and operating on rivers and lakes brought the total tonnage entered to 86,368,005, as compared to 81,211,296 in 1927, and the total tonnage cleared to 86,063,348, as compared with 81,862,749 in 1927.

RAILWAYS. About one-half of the railway mileage of Canada is operated by the Government as the Canadian National Railways System. On Jan. 1, 1928 this system had 22,190 miles of line, not including the Central Vermont Railway (433 miles) and the Thousand Islands Railway (46 miles). In 1927 it carried 18,843,962 passengers and 60,531,058 tons of revenue freight

Gross earnings from operation were \$227,560,927 and the operating expenses were \$198,646,706. In 1928 operating revenue totaled \$276,631,921 and operating expenses, \$218,248,343, the net earnings from operation being about \$13,000,000 more than in 1927. The principal private railway is the Canadian Pacific, which in 1927 had a single track mileage within Canada of 14,170 miles. Its gross earnings from operation in 1929 were \$209,730,955 and in 1928, \$229,039,207. The operating expenses, were \$166,586,411 in 1929 and \$177,344,345 in 1928. Net earnings in 1928 were \$51,694,452, in 1929 they were \$43,144,543. Gross revenues of all Canadian railways in 1928 were \$557,703,118, or 11.6 per cent higher than in 1927.

Statistics of the railways in 1913, 1923, and 1927 are shown in the accompanying table.

## STATISTICS OF RAILWAYS

		1913 *	1923	1927

\* Year ended June 30. \* Including miscellaneous receipts not shown separately.

According to the *Railway Age*, New York, the mileage of new railway lines constructed in Canada in 1929 totaled 841 miles, as compared

with 722 miles in 1928, an increase of approximately 17 per cent. The mileage was greater than for any year since 1914. Most of it consisted of branches or extensions of branches in the Prairie Provinces, only a small amount of construction taking place in Ontario and Quebec. Of the year's total, 295 miles were constructed by the Canadian National and 546 miles, by the Canadian Pacific.

Transfer from the Province of Alberta to the Canadian Pacific Railway and the Canadian National Railways of several lines in northern Alberta took place during 1929 and the railways were merged under one system to be known as the Northern Alberta Railways. During the session of Parliament concluded June 14, 1929, a five-year branch line programme of the Canadian Pacific Railway and a three-year branch programme of the Canadian National Railways to

cost \$50,000,000 and \$29,000,000, respectively, were approved. The Canadian National Railways planned to spend about \$50,000,000 on its Montreal terminals during 1930-35. The laying of steel on the new Hudson Bay Railroad was completed in the spring of 1929 and the ballasting in September. The work was marking the official completion of the line, which was to be driven in the spring of 1930, but it was estimated that it will be two or three years before docks for the accommodation of the vessels, grain elevators, and other " " the handling of grain and cargoes would be in operation. The railway connects The Pas, northern Manitoba, with Fort Churchill on Hudson Bay, 400 miles away. It has already made possible the development of a number of large mineral properties in northern Manitoba.

At the end of 1928, there were 64,121 miles of surfaced highway in Canada, as compared with 47,411 in 1915. In 1928, 8610 miles of highway were constructed, of which 2454 miles were earth and the remainder surfaced. Expenditure on new roads during the year was \$38,912,029. The total extent of earth and surfaced roads was 381,977 miles, of which 40 per cent were in Saskatchewan. An experimental fast air-mail service between central Canada and the Atlantic coast was established Dec. 9, 1929. The new route links Montreal, Quebec, Moncton, and Saint John. In 1928 there were 53,777 miles of telegraph and cable line; the gross revenues for the year totaling \$14,740,741 and the operating expenses \$11,647,063. All figures represented substantial increases over 1927 totals. On July 1, 1929, the Canadian National Telegraphs acquired and commenced operation of the complete land mileage of Western Union Telegraphs in the Maritime Provinces. Wireless and radio stations in 1928 numbered 269,581, including 268,420 private receiving stations. There were 1,259,987 telephones in use in 1927. In 1928 there were 12,478 post offices.

GOVERNMENT. Executive power is exercised in the King's name by the Governor-General of Canada, acting through a responsible ministry or cabinet. Legislative power is in a Parliament of two Houses: a Senate and a House of Commons, the former consisting of 96 members appointed for life and the latter of 245 members in accordance with the distribution act of 1921, elected for five years (unless sooner dissolved) by popular vote, including woman suffrage. Women are eligible for election to Parliament. The Governor-General in 1929 was Viscount Willingdon. As a result of the election of Sept. 14, 1926, the House of Commons was composed of the following parties: Liberals, 118; Conservatives, 91; Liberal Progressives, 11; United Farmers of Alberta, 11; Progressives, 9; Labor, 3; and Independent, 2. The cabinet as formed on Sept. 25, 1926, is as follows: Prime Minister, Secretary of State for External Affairs, William Lyon Mackenzie King; Finance and Receiver General, James A. Robb; National Defense, Col. J. L. Ralston; Postmaster General, Peter J. Vemot; Soldiers' Civil Reestablishment and Public Health, James H. King; Justice and Attorney-General, Ernest Lapointe; National Revenue, W. D. Etherington; Marine and Fisheries, Pierre J. A. Caudin; Secretary of State, Fernand Lafont; Railways and Canals, Charles A. Dunning; Interior, Indian Affairs, and Mines, Charles Stewart; Agriculture, William R. Motherwell; Public Works, John C. Elliott;

Trade and Commerce, James Malcolm; Solicitor General, Lucien Cannon; Immigration and Colonization, Robert Forke; Labor, Peter Heenan; Minister without Portfolio, Senator Raoul Dandurand.

### HISTORY

Widespread optimism as to the Dominion's future, resulting from a year of unexampled prosperity, was reflected by the actions of Parliament, which remained in session from Feb. 7 to June 14, 1929. Substantial reductions in taxation were provided for and ambitious programmes of railway and harbor development were approved. See *Railways*, above. Tariff reductions and decreases in sales and "misance" taxes were expected to reduce the revenue from these sources by \$25,000,000 during the fiscal year 1929-30. Parliament also handed over to the Prairie Provinces the management of their water powers.

The Liberal government of Premier Mackenzie King, firmly seated in power, enacted legislation for the reorganization of the fisheries services, the establishment of national research laboratories, and the extension of air-mail and steamship services. It was confronted with various internal and external problems. The most pressing of the latter involved Canada's relations with the United States, the normal cordiality of which was impaired by the threat of adverse tariff legislation by Congress and irritations incident to Prohibition enforcement and the Anglo-American naval controversy. R. B. Bennett, leader of the Conservative Opposition, in a debate on the Kellogg-Brand Pact, took strong exception to "jingoistic" statements of certain American papers, declaring that when "our great neighbors talk of war against Great Britain, they should understand that they are talking also of war against Canada." He was severely rebuked by Premier King, who affirmed his belief that the United States had signed the Kellogg treaty in good faith. The statements referred to, the Premier said, did not warrant "the leader of the Opposition making a jingoistic speech in this Parliament calculated to throw doubt upon the good faith of the neighboring Republic."

An official protest against the sinking of the Canadian ship *Im Alone* in the Gulf of Mexico by a United States Coast Guard prohibition patrol boat was made by the Canadian Minister at Washington on April 9. On April 25, it was announced that the case, which had aroused considerable resentment in Canada, would be settled by arbitration. The tariff controversy was accompanied by plain indications that the virtual exclusion of Canadian agricultural products from American markets sought by certain tariff revision advocates would be followed by retaliatory tariff measures against American manufactures in the Canadian market. The policy of the Government, as stated by James A. Robb, the Minister of Finance, was one "of favoring those countries which favor our products." The Government's cooperation with the United States in the proposed St. Lawrence Waterway project would depend to a considerable extent upon the American tariff policy; it was indicated.

The House of Commons on May 20 approved the convention for the preservation of Niagara Falls, which was signed by representatives of the United States and Canada on January 2. A

sign of Canada's growing political independence from the mother country was seen in the proposal by government officials, in connection with negotiations for a new Anglo-American arbitration treaty, that Canada substitute her own arbitration machinery with the United States for that proposed in the draft of the treaty.

Toward the end of 1929, the good-will visit of Premier Ramsay MacDonald to the United States and Canada and the failure of Congress to enact tariff legislation during the special session called by President Hoover removed the principal sources of friction between the Dominion and the United States. A reciprocal treaty governing the admission of civil aircraft, the issuance of pilot licenses, and acceptance of certificates of airworthiness for aircraft imported as merchandise was concluded between the two governments in November.

J. H. Thomas, member of the Labor cabinet charged with the solution of Britain's unemployment problem, visited Canada in the fall and in conference with government officials sought to arrange for immigration to Canada from the United Kingdom on a greater scale, and the greater use of British coal and manufactured steel. Later, a delegation representing the Canadian Wheat Pool visited England to discuss a more extensive exchange of Canadian wheat for British coal.

Negotiations by the western provinces for the acquisition of lands and natural resources within their respective boundaries held by the Federal Government led to a revival during the year of the religious controversy between the Protestant provinces and Catholic Quebec. The specific issue was the insistence by French-Canadian Catholic Liberals that the terms of transfer of school lands involved should include a clause safeguarding the rights now exercised by the Catholic schools in Alberta. The Dominion Government finally reached an agreement with the provincial governments of Alberta and Manitoba which was signed at Ottawa, December 15, subject to ratification by the Dominion Parliament and the provincial legislatures. Besides returning to the provinces their natural resources, the agreement stipulated that the annual subsidies formerly received by the provinces from the Dominion were to continue. The national parks in Alberta remain the property of the Dominion. The influx of Roman Catholic immigrants into Saskatchewan and a dispute involving parochial education there also gave rise to a strong anti-Catholic sentiment which found expression in criticism of the King government as being dominated by Catholic Quebec. Sectarianism in the schools was a dominant issue in the Saskatchewan election during the year, which resulted in a sweeping Conservative victory.

The seven provinces which have adopted plans for the sale of liquor through official channels were joined in October by Nova Scotia, where the prohibition laws were repealed in September by a considerable majority. Prince Edward Island, which decisively endorsed its prohibition act by plebiscite on July 18, remained the sole province where prohibition remained in favor. An old-age pension system, under which the provincial and Federal governments assume equal shares of the burden, went into effect in Ontario, British Columbia, Alberta, Manitoba, Saskatchewan, and the Yukon during the year.

Quebec and the Maritime Provinces refused to accede and protested the principle upon which payments are being shared as distinctly unfair to them.

**CANADA, THE UNITED CHURCH OF** Under this designation a single body was formed in 1925 by the union of the Methodist, Methodist, and Presbyterian churches in Canada; the Methodist churches of Newfoundland and Bermuda also were included in the union. Following upon the formal consummation of the union June 10, 1925, a total of 500 congregations, mostly in smaller towns and rural districts, amalgamated into approximately one-half that number of self-supporting charges. The board of home missions also established 285 new fields of home-mission status, each of these fields including between three and four places at which public worship was inaugurated and regularly conducted. In 1929 nearly 1000 communities, in areas previously unoccupied by any church, were served. During the same period, 375 fields which formerly received aid became self-supporting and passed off the home-mission list. At the end of 1929, there were 1500 fields under the auspices of the board of home missions, and 4368 preaching places in these pastoral charges.

Three general councils were held in 1925, 1926, and 1928 to forward the permanent organization of the church. At the third council, held in Winnipeg in September, 1928, action was taken toward a strong evangelistic movement preparatory to the nineteenth centenary of Pentecost in 1930. The fourth general council was to be held in London, Ont., September, 1930. On Dec. 31, 1928, there were 11 conferences, 115 presbyteries, 647,154 communicants, an increase of 46,632 since June, 1927, 405,425 families under pastoral care, 1,485,384 persons under pastoral care, and 634,432 Sunday school members, an increase of 54,940 since the union. The moderator of the general council for 1928-30 was the Rt. Rev. William T. Gunn, M.A., D.D. the secretary was the Rev. T. Albert Moore, D.D. Headquarters are 421 Wesley Buildings, Toronto, Ont.

**CANADIAN WHEAT POOL** See COOPERATION.

**CANALS** The outstanding event of the year in the United States was the formal opening by President Hoover of the Ohio River canalization, a work which had been under way for fifty years and had cost some \$125,000,000. With the completion of Dam No. 53, near Grand Chain, Illinois, a channel of 9 feet depth became available from Pittsburgh down. This last structure cost \$5,000,000 and is equipped with a lock 110 feet wide with a lift of 9 feet.

A final decision on the Chicago Drainage Canal question was also one of the important events of the year. This decision emphasized one of the greatest sanitation problems in the world at a time when the city government of this great centre was in a demoralized condition. The results cannot fail to be of vital interest to the public, as well as to engineers.

In general, the inland waterway situation underwent little change. Ambitious schemes were being discussed in Belgium but, apparently, economic justification was lacking or uncertain. Transportation is a vital factor in modern life. Theoretically, at least, water transportation should be economical. Practically, inland canals do not attract traffic. What is to be the future of inland transportation? Perhaps the great Ohio

experiment will throw some light on the economic limits and the limitations of canal development. At present, the future is uncertain and prospects of a canal revival far from bright except in the minds of those enthusiasts who refuse to consider economic limitations.

**OHIO RIVER CANALIZATION** The canalization of the Ohio River from Pittsburgh to its junction with the Mississippi at Cairo, 968 miles, was completed during the year and formally inaugurated by President Hoover. The river is now open to boats of 9-foot draft for its entire length. This great work is not only of great magnitude as an accomplishment, but also of great importance in the problem of inland transportation in the United States. Millions of public funds have been wasted in America due to the activities of canal enthusiasts who have managed to secure the construction of inland waterways in locations where even the most casual economic studies would have shown that these projects were doomed to failure. The great Ohio experiment will be watched with interest. If any inland waterway can be successful, this great traffic artery in the heart of the nation should certainly prove a success. The *Engineering News-Record* (New York) observed:

Where the points of origin and distribution of freight are both on the same waterway, as in the case of much of the coal and coke movement on the Ohio, water is ideal for the shipment of bulk commodities, especially where the time factor is not important. And where the point of origin of the bulk commodity like steel is on a waterway which provides a long haul to a point of transshipment, as with steel coming down the Ohio to points on the lower Mississippi, a waterway also presents a distinct advantage. Nowadav, however, the elements of time and certainty of movement as well as the cost of transshipping from water to rail are factors working against the use of inland waterways. If a general freight business does not develop on the Ohio with all the advantages which it possesses, any scheme to construct other waterways primarily for that purpose may as well be abandoned."

In 1924 the Inland Waterways Corporation was created by an act of Congress. Its object was to demonstrate the value of transportation on the navigable rivers of the Mississippi Valley. The entire stock of the corporation is owned by the Government and it is headed by Maj. Gen. A. Q. Ashburn, who states, "Our problem was to show once and for all that inland transportation was economically sound and could be used to bring about cheaper transportation without hurting the rail lines." As President Coolidge said at the time, "Our whole 100-year-old policy of developing navigable streams at tremendous cost was either a piece of inconceivable and colossal folly, or else we as a people had been unexcusably remiss in taking advantage of our opportunities."

Thus, the great Ohio construction experiment has been made into a complete operating experiment by the organization of this corporation and the future of inland transportation in the United States will depend in large measure on the success of this magnificent venture.

**THE CHICAGO DRAINAGE CANAL** A most important decision in the long-disputed problem of the diversion of water by Chicago from Lake Michigan for drainage purposes, was handed down by the Supreme Court in January, 1929. The court held that the War Department could grant to Chicago diversion rights only sufficient to provide sufficient water for navigation in the Chicago canal and appointed Judge Charles E. Hughes as special master to make recommenda-

tions as to the conditions which Chicago must follow in carrying out this decision. The *Engineering News-Record* observed that "save for the final action of the court in affirming or modifying his recommendations, the litigation is over. The case had been in the courts for some twenty-five years and was outlined in the 1928 YEAR BOOK.

Judge Hughes limited the ultimate diversion by Chicago to 1500 cubic feet of water per second and allowed 9 years as the time within which this limit must be reached. In 1929 the Sanitary District of Chicago was diverting some 10,000 second-feet of water by means of which the sewage of Chicago was carried through the drainage canal into the upper Mississippi. With this diversion reduced to 1500 second-feet, Chicago will now have to build sewage-treatment works which will far exceed any such construction the world has yet known.

"Physically and technically," the *Engineering News-Record* states, "this is readily possible financially, it is well within the capacity of a city of several millions. The real task—and it is one of tremendous importance—is governmental reform and better administration." There is a complete lack of confidence on the part of the citizens of Chicago in the present government, alleged to be "deeply entrenched in corruption and inefficiency." Voters have refused to authorize new bond issues, taxation is in a muddle, the "situation is without parallel in the history of cities." Obviously, Chicago faces a tremendous problem, but one which she has brought on herself through unreasonable delay and persistent attempts to evade her responsibilities.

**WELLAND CANAL** A very complete series of articles during this year in the Canadian *Geographical Magazine* (London) during the year. The importance and economic possibilities of the work were discussed in the 1928 YEAR BOOK. See **WELLAND CANAL**.

**NICARAGUA CANAL** Agitation for a ship canal on the old Nicaragua route reached a point where an appropriation had been made for preliminary surveys for this canal. While traffic through the Panama Canal continued to grow, its capacity had not been reached and may be considerably increased by additional reservoir and lock construction. The Nicaragua project was, therefore, a development for the future with no immediate prospects of active construction being undertaken. See **PANAMA CANAL**, **SALT STE MARIE**, **CANALS OF THE WORLD**.

**CANARY ISLANDS** A group of small islands off the northwest coast of Africa, belonging to Spain. Area, 2810 square miles, population, Jan. 1, 1928, estimated at 531,533. The capital is Santa Cruz de Tenerife, with an estimated population in 1928 of 54,504. The next largest city is Las Palmas, with a population of 69,086 in 1928. The University of Seville maintains an educational establishment in the Canaries and is in charge of higher education. There is regular steamship communication with Spain. The islands are under the administration of continental Spain through a local governor.

**CANBERRA** The new Federal capital of Australia. See **AUSTRALIA**.

**CANCER** Irradiation treatment is considered at great length by Prof. H. Holthausen in the *Deutsche medizinische Wochenschrift* for September 6. There has been an ebb and flow in medical

attitude toward this subject, the optimism of early years having given way to disappointment, while numerous improvements in technique have produced a more favorable outlook. A plethora of detail has been built up in which the location of the mass, dosage, cooperation with other measures, etc. play a major rôle. At present, we seek to know the status of particular types of cancer under irradiation treatment. The best results are obtained in cancer of the cervix uteri, for they have been at least equal to those of the knife and not a few inoperable cases also are curable. In cancer of the breast, irradiation cannot supplant the knife and is best used after surgical removal to complete the cure and prevent recurrence. In the great group of cancer of the stomach, œsophagus, etc., it can effect little. Radium is indicated only in certain superficial forms of cancer to which access is readily obtainable and hence no real comparison can be instituted with more general resources like roentgen rays and the knife, to which must be added the great severity of the substance. In discussing irradiation as a general measure, we cannot be guided by the results of a few specialists but must follow those of the average radiologist.

**PROGNOSIS.** Dr. M. J. Sittenfeld, a radiologist of New York, writes a paper with this title for *Radiology* for September. Despite all of the improvements in surgical techniques for the past quarter-century, the mortality of cancer shows no change for the better, and the disease is on the increase. Even the figures in the most favorable types of cancer for early surgery do not show the anticipated improvement. True surgical cures are often only palliative for late recurrence sets in. Advances in surgical technique too often involve wider excisions of a crippling nature. On the other hand, in the irradiation treatment of cancer, we see actual gain from year to year and in the radiosensitive group of cases results are often all that could be asked for. There is likewise progress of a sort in internal treatment, notably in chemotherapy, and when to surgery are conjoined the results of irradiation and other plans of treatment, the figures for certain cancers—notably those of the cervix—show distinct gain. The fact that about three-fourths of all cancer patients present themselves at a period too advanced for radical surgery is alone sufficient to eliminate surgery as a routine remedy. The only solution is cooperation between surgeon, radiologist, and internist, to whom is to be added, of course, the pathologist. Until such coordination is the rule, we need not expect progress in cancer therapy.

**THE LEAD TREATMENT.** In speaking of the lead treatment, it should always be borne in mind that it is regarded merely as an accessory to the X-ray treatment of cancer. An account of the symposium on this subject before the Congress of Radiology (1928) appears in full in the *Journal of the American Medical Association* for January 5 and 12. In the discussion which followed the reading of a number of papers, the members agreed that lead was too toxic for routine use although there was considerable difference of opinion as to which preparation was the safest. It is desirable and not beyond possibility that an ideal form of lead may be discovered which will confer the benefit inherent in the metal without the risk of lead poisoning. Nearly everyone who has made trial of the treatment has experienced some good results, and not a few

individuals were busy who owed their usefulness to the combined treatment. Several would have it that the lead treatment be tested without irradiation, for with the combined method it is difficult to apportion credit. This step it was difficult to take, lest the patient be deprived of some of the benefit of the rays and not a few cases have been treated by lead alone with results inferior to those of the combined method. Doubtless many cancers remain quite insensitive to the action of lead and in this group it is folly to persevere.

**A STABILIZED AND HARMLESS COLLOIDAL LEAD.** It has been conceded by many authorities that a harmless form of lead which retains its therapeutic power over cancer holds out greater promise of cure than any drug yet thought of. Professor Lorenzini, a biochemist of the University of Milan, claimed such a discovery for himself (see *Journal of the American Medical Association* for February 2, p. 403). He added to the pseudocolloidal solution which has passed for a genuine colloidal preparation, as prepared electrically, traces of sodium thiosulphate in claiming that this substance antagonizes the tendency of the solution to decompose with formation of toxic lead compounds. The result is a perfectly stable colloidal solution free from toxicity. It can be injected in amounts thirty fold greater than the doses used by Blair Bell and without producing any changes in the organism. A number of surgeons tested the preparation in the clinic and found it innocuous. Several cases of cancer had been treated with remarkable benefit, but the author was satisfied to claim that he had made available for all a safe preparation of lead for general testing.

**CANDY.** See VALUE OF. See FOOD AND NUTRITION.

**CANE SUGAR.** See SUGAR.

**CAPE COLONY.** See CAPE OF GOOD HOPE PROVINCE.

**CAPE OF GOOD HOPE PROVINCE.** One of the four original provinces of the Union of South Africa, the southernmost province of the Union, formerly known as Cape Colony or the Colony of the Cape of Good Hope. Capital, Cape Town. Area, 276,536 square miles, population at the census of 1921, 2,781,542, of whom only 650,327 were Europeans. On June 30, 1928, the total population was officially estimated at 3,035,802, including 728,159 Europeans, 1,782,234 Bantus, 7961 Asiatics, and 517,448 of mixed and other origin. The census of 1926 showed 706,137 Europeans.

The total population at the census of 1911 was 2,564,967. The chief towns with their white population in 1926 were Cape Town, 130,568, Kimberley, 17,268, Port Elizabeth, 33,371, East London, 23,210. The movement of population in 1927, so far as registered was Europeans, births, 44,347, deaths, 16,627, marriages, 15,622. For non-Europeans there was births, 51,077, deaths, 45,219, marriages, 16,972. In 1927 there were 2400 white schools, with 138,463 pupils and 4609 native schools, with 182,937 pupils. The state expenditure for education was £3,240,918. There was a university at Cape Town with 190 teachers and 1770 students in 1927. The trade between the province and the United Kingdom in 1928 was. Imports into the United Kingdom from the province, £15,540,238, exports from the United Kingdom into the province, £13,953,378. The chief exports to the United Kingdom were

wool, mohair, hides and skins, corn, and feathers, the chief imports from the United Kingdom were cotton and woollen goods, machinery, iron and steel goods, and paper. The administrator of the province in 1929 was A. P. J. Fournie. See SOUTH AFRICA, UNION OF.

**CAPE VERDE (vôrd) ISLANDS.** A group of 14 islands off the western coast of Africa belonging to Portugal. Area, 1475 square miles; population at the census of 1926, 131,147, of whom 59,031 were males. The chief products are sisal, castor oil, coffee, mustard, brandy, oranges, and hides. A small military force is maintained on the islands. The estimated public revenue in 1926-27 was 17,504,815 escudos and the expenditure, 17,111,699 escudos. Imports in 1927 amounted to 60,012,910 escudos and exports to 5,082,420 escudos (the escudo had an exchange value of \$0.0447 in 1928). The chief port is Bissau. The administration of the islands is in the hands of a governor whose seat is at Praia, the capital.

**CAPITAN, LOUIS,** French archaeologist and Americanist, died Sept. 1, 1929, in Paris, where he was born on Apr. 19, 1874. He had a medical diploma and was a member of the Académie de Médecine, but he did not practice this profession. His life work was the investigation of early prehistory, including that of the Americas. He began his career as an archaeologist by exhibiting his collections at the Paris Exposition of 1878. He continued collecting in this field throughout his life, and at his death left the greater part of his material as a legacy to the French National Museum at St. Germain. After 1893 he spent much time in the investigation of French caverns and helped to introduce the stratigraphic method of debris excavation and a technique for deciphering and copying engravings and paintings preserved on cave walls. In 1899 he was elected professor of prehistoric anthropology at the École d'Anthropologie, and in 1908 he became Lombart professor of American archaeology at the Collège de France. His writings, which are for the most part fragmentary articles and summaries, deal mainly with the Paleolithic arts and industries of the Old World and with both Paleolithic and Neolithic topics in America. He was also a lecturer and one of the last of the distinguished group of scientists who first made the modern world acquainted with Paleolithic man. He was an officer of the Légion of Honor.

**CARBOLOY.** See CHEMISTRY, INDUSTRIAL, under *Acetylenes*.

**CARINTHIA,** A province of the Republic of Austria, formerly a crownland of the Austro-Hungarian Empire. Area, 3680 square miles; population at the census of 1923, 370,748, as compared with 396,200 in 1910. Carinthia, in 1923, had 5.67 per cent of the total population of Austria. Capital, Klagenfurt, with a population in 1923 of 27,423.

**CARLETON COLLEGE.** A coeducational institution of higher learning in Northfield, Minn., founded in 1866 and maintaining relations of cooperation with the Congregational, Baptist, and Protestant Episcopal churches. The enrollment for the autumn of 1929 was 853. There were 66 faculty members. The endowment amounted to \$2,177,897, and the total income for the year was \$743,083. There were 91,300 volumes and 30,000 pamphlets in the library. President, Donald John Cowling, Ph.D., D.D., LL.D.

**CARMALT, WILLIAM HENRY,** American surgeon and university professor, died in New Haven, Conn., July 17, 1929. Born in Friendsville, Pa., Aug. 3, 1836, he was graduated from the College of Physicians and Surgeons, Columbia University, in 1861. After practicing in New York, 1861-60, he studied surgery in Germany until 1874. He joined the United States, he joined the Army as lecturer on ophthalmology and otology, 1870-79, as professor of those subjects, 1879-81, and as professor of the principles and practice of surgery, from 1881 until made professor emeritus in 1907. Until about two years before his death, Dr. Carmalt maintained a private practice in New Haven, being consulting surgeon at the New Haven Hospital. He served as president of the General Hospital Society of Connecticut, the Connecticut State Medical Society, 1904, and the American Surgical Association, 1907.

**CARMAN (WILLIAM) BRUCE,** Canadian poet, died June 8, 1929, in New Haven, Conn. He was born in Fredericton, N.B., on Apr. 15, 1861, and was graduated from the University of New Brunswick, receiving the A.B. degree there in 1881 and the A.M. in 1884. He also studied at the University of Edinburgh and at Harvard, after which he read law for two years. During 1890-92 Mr. Carman was office editor of *The Independent* in New York City and in 1891 editor of *The Chap Book* in Boston. He also taught and practiced engineering. It is, however, as poet and lecturer that he is best known. His first book of poetry was *Low Tide on Grand Pré* (1893) and his last, *Wild Garden* (1929). Among his other books are *Pipes of Pan* (Numbers 1, 2, 3, 4, 5, 1902-05), *Echoes from Iagahondia* (1912), *April Days* (1916), *Far Horizons* (1925). In 1921 the Canadian Authors Association crowned Mr. Carman Canada's major poet, and in 1928 he was awarded the Lorne Pierce Medal of the Royal Society of Canada, the highest literary distinction in that country. Because of his American descent and long residence there, the United States also claims him.

**CARNEGIE CORPORATION OF NEW YORK.** Established by Andrew Carnegie in 1911, this corporation was formed for the advancement and diffusion of knowledge and understanding among the people of the United States, Canada, and the British colonies. Its total endowment is approximately \$135,000,000, of which \$10,000,000 is applicable elsewhere than in the United States. The income only is subject to the disposal of the trustees. The programme of the corporation in 1929 was concerned chiefly with library service, the place of the arts in American life, adult education, scientific research, professors' annuities, and educational studies.

While the charter of the corporation affords a liberal choice of methods by which it may proceed, the policy pursued from the outset by its founder, and later adhered to by its trustees, has followed a definite principle. The corporation has conceived its function to be not that of an operating agency in itself but rather that of an agency charged with the duty of studying and estimating those forces and institutions that make for the advancement and diffusion of knowledge and understanding in the areas specified and of aiding them in such measure as may be possible within the income

of the corporation, having care always to the fact that the income of this endowment is to be a liquid asset for each generation.

Should the trustees of today fail to use the funds for fruitful purposes, the trustees of the next generation will have the same power for usefulness that belonged to their predecessors and may be more fortunate in its exercise.

In 1929, as in the previous year, approximately two-thirds of the annual income of the corporation was devoted to a reduction of unpaid obligations, which on Sept. 1, 1929, amounted to \$23,251,454. The annual report of the president, Frederick P. Keppel, showed that during the fiscal year 1928-29 the sum of \$7,729,750 was appropriated toward library service (\$445,500), the encouragement of adult education activities (\$160,250), the support of national organizations in the field of fine arts and of departments of arts in colleges and universities and of projects for the appreciation of arts and music (\$1,000,000), the support of educational and scientific studies, research, publications (\$557,700), general interests including the Carnegie Endowment for International Peace (\$779,300), and annuities for professors (\$5,400,000).

From the income of its \$10,000,000 fund, the corporation continued its five-year programme in British Africa, involving a total of \$500,000. Scientific research, and to Jeanes Schools, exchange of educational visits, and library service were included in the programme, which was carried on largely through local bodies. It also aided various educational enterprises in Canada, Australia, and New Zealand. The corporation made scholarship grants for graduate study by prospective college teachers of the arts and by qualified students of library science. It continued to support various important projects, such as research in purification of manna, investigation of high-frequency rays of cosmic origin, cooperative research in psoriasis and otosclerosis, and study of the inheritance of infectious diseases. Various studies were supported by the American Historical Association, the Modern Language Association, the Institute of Economics, and the American Law Institute were continued through the year.

The trustees of the corporation in 1929 were James Bertram, Nicholas Murray Butler, Louise M. Carnegie, John J. Carty, Samuel Harden Church, Robert A. Franks, William J. Holland, Henry James, Frederick P. Keppel, Russell C. Leffingwell, John C. Merriam, John A. Poynton, Henry S. Pritchett, and Elihu Root. Officers of administration were Elihu Root, chairman of the board, Robert A. Franks, vice chairman and treasurer, Frederick P. Keppel, president, James Bertram, secretary, and Robert M. Lester, assistant to the president. The headquarters are located at 522 Fifth Avenue, New York City.

**CARNEGIE FOUNDATION FOR THE ADVANCEMENT OF TEACHING.** The A foundation established by Andrew Carnegie on Apr. 16, 1905, when he placed an endowment of \$10,000,000 in trust with 25 trustees, mostly presidents of universities and colleges, for the purpose of encouraging higher education in the United States, Canada, and Newfoundland, chiefly by providing retiring allowances for teachers in universities and colleges and pensions for their widows. The foundation was incorporated by Act of Congress in 1906. Its resources were increased by a further gift of \$5,000,000 from Mr. Car-

negie in 1908, and by appropriations of \$1,250,000 in 1913 and \$12,000,000 in 1918 from the Carnegie Corporation, which Mr. Carnegie established in 1911. At the completion of its twenty-fourth year in 1929, the foundation had endowments and accumulated reserves amounting to \$32,257,000, and had distributed \$18,817,000 in retiring allowances and pensions to 1100 teachers and 600 widows, chiefly through 72 associated institutions, selected because of their educational excellence. The foundation publishes extensive annual reports, which deal with many educational problems. Its division of educational inquiry, established in 1913, has issued a series of comprehensive bulletins, dealing with medical, legal, engineering, dental, and vocational education, the training of teachers, intercollegiate athletics, and kindred subjects. In 1929 preliminary announcements were issued concerning the initial results of a comprehensive study of the relations between schools and colleges in Pennsylvania. Dr. Henry Smith Pritchett is president and Clyde Furst, secretary. The headquarters are at 522 Fifth Avenue, New York City. See UNIVERSITIES AND COLLEGES.

**CARNEGIE INSTITUTE, PITTSBURGH.** See ART EXHIBITIONS, ART MUSEUMS.

**CARNEGIE INSTITUTE OF TECHNOLOGY.** A nonsectarian institution for technical education at Schenley Park, Pittsburgh, Pa., founded in 1900. The enrollment for the autumn of 1929 was 6494, including 2472 registered in the regular day courses and 4022 in the evening courses. For the summer session, 754 students were enrolled. The faculty of 1929 numbered 348, of whom 226 were on full time and 122, on part time. The endowment of the institution was \$15,900,000 and the annual income \$794,000 (not including student fees). The institute has a campus branch of the Carnegie Library of Pittsburgh, which has 450,000 volumes. President, Thomas Stockham Baker, Ph.D., LL.D., Sc.D.

**CARNEGIE INSTITUTION OF WASHINGTON.** An institution founded in 1902 to "encourage biological investigation, research, and discovery and the application of knowledge to the improvement of mankind." The results of its investigations are made known through the scientific journals, the institution's *Year Book*, a series of monographs which it issues, and other regularly established channels. During 1929 the executive committee authorized the publication of 13 volumes at an aggregate estimated cost of \$85,250. Among these were *European Treaties Bearing on the History of the United States and Its Dependencies, 1650 to 1697* (vol. III), by Frances G. Davenport, *Correspondence of Andrew Jackson* (vol. IV), by John S. Bassett, *Studies in Comparative Seismology*, *Earthquake Conditions in Chile*, by Bailey Willis, *Race Crossing in Jamaica*, by Charles B. Davenport and Morris Steggerda, *The Hydrostatic Pneumatic System of Certain Trees*, *Movements of Liquids and Gases*, by D. T. MacDougal, J. B. Overton, and Gilbert M. Smith, and *Plant Competition: Analysis of Community Function*, by Frederic E. Clements, John E. Weaver, and Herbert C. Hanson.

The twenty-fifth anniversary of the founding of the Carnegie Institution was observed in 1929, the initiation of specially organized activities in the biological sciences being celebrated through the department of genetics at Cold Spring Har-

bor on May 31 and investigations in the field of physical sciences being emphasized by utilization of the visit of the ship *Carnegie* to San Francisco Harbor on August 26. During the year, a fundamental study expressing one of the most interesting phases of work of the geophysical laboratory was initiated through the spectroscopic investigation of elements present in flames issuing from a living volcano, the investigation was conducted by Dr. E. G. Zies on Mount Rasing in eastern Java. Another contribution to the geophysical laboratory was through the cruise of the Submarine *N 21* over selected areas in the Gulf of Mexico, the Caribbean Sea, and portions of the South Atlantic, made possible by the cooperation of the U. S. Navy Department, it furnished an important body of data for interpretation of the composition, structure, and incidentally of the history of crustal movements in the outer region of the earth.

Opportunity for expansion of the research programme in the department of embryology was made possible by the generous extension of laboratory facilities placed at the institution's disposal by The Johns Hopkins University. Outstanding in this field was the work of Dr. Lewis and Dr. Gregory in obtaining an excellent record of movement in the developing mammalian egg. In similar manner the cooperative research of Dr. Benedict and Dr. Riddle on the relation of the thyroid to metabolism continued to furnish an exceptional view of the relation between development as initiating through the basic elements of heredity and the influences arising from the glands of internal secretion.

Development of the year's programme of researches centring upon the studies in Middle American archeology involved cooperation of such agencies as would be required to give not merely the history of culture in the Middle American region but to obtain with such data an understanding of relationship between the sequence of events in the Maya area and the history of cultural development in America. The programme involved intensive studies of Maya, initiating at both the later and earlier stages of the known historical series. The exceptionally interesting work of Earl Morris at Chichen Itza in Yucatan, as illustrated by the study of the Temple of the Warriors, was based upon investigations at the later end of Maya history. At the earlier end of the sequence investigations by Oliver G. Ricketson, Jr., were conducted at the site of Uxmal in Guatemala, the earliest dated Maya city. The discoveries at the latter place had exceptional interest in the light of significant researches which were carried out in middle Mexico by the Mexican Government and by various institutions from Mexico and other countries. These studies in turn, were considered in the light of the investigations of very early cultural stages of southwestern United States, such as were conducted by Mr. Morris and Dr. Kidder in association with other institutions.

The plan for investigation of problems in Maya history was not concerned solely with archeological data. From the beginning it had been formulated as an attempt to see the history of this people in relation to their environment, including natural features of the region and contacts with other cultures, but the men in general presented many obstacles in the way of geographical, geological, and biological investi-

gations, since it was largely uncharted as to details of the various subjects and much of it could be penetrated for scientific study only with difficulty. It was, therefore, extremely important to the institution to have opened an opportunity to view a considerable part of the region by means of an air reconnaissance proposed and carried out by Col. Charles A. Lindbergh through the courtesy and cooperation of the Pan-American Airways, Inc. Although the examination was possible only at a time of the year when the difficulties of seeing were relatively large, the results of the voyage by Colonel Lindbergh, Dr. Kidder, and Mr. Ricketson gave an extremely valuable view of especially important parts of the area. The work served as a guide of large value not only with reference to location of little known or unknown ruins but with relation to opportunity offered for interpretation of the character of the country as illustrated in its topography, distribution of water supply, character of vegetation, and the possibility of contrasting various types of environment.

The institution's non-magnetic ship *Carnegie*, which had been used since 1909 in a world-wide survey of the earth's magnetic field, was destroyed by explosion and fire in Apia Harbor, Samoa, on Nov. 29, 1929. Since its departure from Washington in May, 1928 the vessel had sailed through the northern half of the Atlantic Ocean, the Caribbean Sea, the Panama Canal, the southeastern central, and northern portions of the Pacific and had touched such points as Easter arriving in San Francisco Harbor in July for thorough reconditioning before entering upon its three-year cruise which had been planned. Exhibits showing how data on the magnetism of the earth were gathered on these cruises and models of the apparatus used formed a special section at the institution's annual exhibition held in Washington Dec. 14-16, 1929.

Total receipts of the institution from interest on endowment, bonds and bank deposits, sales of publications, refunds on grants, and miscellaneous items amounted to \$8,080,716 for the year, while total expenditures including purchase of bonds, large projects, minor grants, publications, and administration amounted to \$8,259,061. The president in 1929 was Dr. John C. Merriam and the administrative secretary was W. M. Gilbert. The executive committee included Edwin Root, chairman; John J. Cary, W. Cameron Forbes, John C. Merriam, William Barclay Parsons, Stewart Paton Hewitt, S. Pritchett, and George W. Wickersham.

**CAROLINE ISLANDS** See GERMAN NEW GUINEA

**CARPENTER**, EDWARD, English poet and Socialist, died in Guildford, Surrey, June 28, 1929. Born in Brighton, England, Aug. 29, 1844, he attended Brighton College and Trinity Hall, Cambridge. Elected a fellow of Trinity, he took orders in 1869, and served as curate at St. Edward's and lecturer at the university until 1874. He then resigned from the church to teach science and music in the university extension movement in northern England. This he gave up in 1881 and two years later settled on a farm near Sheffield where he lived the simple life growing fruits and vegetables and selling them in the market place, and making sandals. Having become interested in Socialism, he became at this time an active street-corner speaker on this subject. He also continued the writing

which he had begun at Cambridge Carpenter's style was influenced by Walt Whitman, whom he visited in America in 1884. In his volume of poetry, *Towards Democracy* (1883), and its prose counterpart, *Civilization, Its Cause and Cure* (1889), he set forth his democratic teachings, which for the most part he merely amplified and developed in his numerous later works, which included *The Promised Land* (1910), *The Drama of Love and Death* (1912), *Pagan and Christian Creeds, Their Origin and Meaning* (1920), *The Psychology of the Poet Shelley* (with E. Bainfield, 1925).

**CARTELS.** See CHEMISTRY, INDUSTRIAL.

#### CASE SCHOOL OF APPLIED SCIENCE.

An engineering college in Cleveland, Ohio, founded in 1881. In the autumn of 1929, the enrollment was 689 students. The summer session of 1929 was 154. The faculty numbered 69 members. The productive funds of the college amounted to \$4,232,583, while the income for the year was \$379,558. The library contained 24,700 volumes. President, William Elgin Wickenden, D. Eng., D. Sc., who succeeded Charles Sumner Howe in 1929.

**CATHOLIC CHURCH.** See ROMAN CATHOLIC CHURCH.

#### CATHOLIC UNIVERSITY OF AMERICA.

An institution of higher education in Washington, D. C., founded in 1867. Affiliated with it are the Catholic Sisters' College for the training of teachers, Trinity College for women, and the houses of study of 27 religious orders. The enrollment for the autumn of 1929 was 989, distributed as follows: School of theology, 106, canon law, 33, law, 34, philosophy, 466, letters, 85, and sciences, 259. In the 1929 summer session, there was a registration of 500. The faculty numbered 119, of whom 39 had the rank of professor, two promotions having been made from the rank of associate professor during the year. The productive funds amounted to \$2,700,273, and the income for the year was \$866,778. Among the important gifts was \$150,000 from Mrs. Justine B. Ward for the erection of a building for the School of Liturgical Music, this school will be maintained from the income of a foundation of \$1,000,000, established by the Dom Mocquereau Schola Cantorum Foundation. The library contained 300,000 volumes. Rector, the Rt. Rev. Monsignor James H. Ryan, Ph. D., S. T. D.

**CAUCASUS,** ka'ka-sūs. A term applied to the indefinite region in southeastern Europe, comprising the isthmus which separates the Sea of Azov and the Black Sea from the Caspian Sea, formerly an administrative division of the Russian Empire. It was divided into two districts of Transcaucasia and Cis-Caucasia, of which the former was divided among the three republics of Armenia, Georgia, and Azerbaijan. These afterward separated and were respectively incorporated under the constitution of 1923, in the Union of Soviet Republics, and are now known as the Transcaucasian Federation of Soviet Republics. Consult each under its own title.

**CAVALRY.** See MILITARY PROGRESS.

**CELEBRATIONS.** The recognition of impor-

tant historical anniversaries and the birthdays of well-known personages is coming more and more to be an accepted procedure, and the practice everywhere is a growing one. In the United States during the year 1929, many of the events so celebrated were sesquicentennial anniversaries of occurrences during the War of the Revolution.

**January 19.** The centenary of the first stage production of Goethe's *Faust* and the 200th anniversary of Lessing's birthday were celebrated simultaneously in Brunswick, Germany, with a theatrical exhibition showing different methods of presentation of the tragedy and with lectures on Lessing's works by prominent authorities.

**January 23.** The 200th anniversary of the arrival of Bishop George Berkeley to the American colonies was celebrated in New Haven at the Berkeley Divinity School. Addresses were given on these topics: The English Background, The American Background; New Light on Berkeley's American Sojourn; Berkeley's Contribution to American Thought; Berkeley's Contribution to American Thought, Berkeley as a Patron of Art; Berkeley as an Educator, and Berkeley's Significance in Modern Philosophy. There was an exhibit of Berkeley's books, manuscripts, and pictures. On January 20, a sermon commemorative of Berkeley was preached in the Cathedral of St. John the Divine in New York City, by Dean W. P. Ladd, and similarly in Newport, where Dean Berkeley lauded, a sermon was preached by the Rev. S. C. Hughes on February 24. Also in New Haven on February 22, a collection of rare Venetian coins and other historical material was placed on exhibition in Yale University to commemorate this event.

**February 25.** The celebration of the 150th anniversary of the capture by George Rogers Clark of Fort Sackville, Ind., was held in Vincennes, Ind., under the auspices of the George Rogers Clark Memorial Commission. A commemorative two-cent postage stamp was issued by the Post Office Department in honor of the event.

**March 19.** The 100th anniversary of the birth of Carl Schurz, editor, diplomat and soldier, was held in the Horace Mann Auditorium, New York City, under the auspices of the Institute of Arts and Sciences of Columbia University. The speakers were Dean F. J. E. Woodbridge of Columbia University, Charles A. Nagel, former Secretary of Commerce and Labor, and George McAneny, representing the Carl Schurz centennial committee, who eulogized Carl Schurz, pointing out that the love of tolerance, recognition of the futility of war, and the potential greatness of the immigrant were the most important lessons taught by the famous liberal.

**March 22.** The 150th anniversary of the presentation to Louis XVI, by Benjamin Franklin, of his credentials as the first American Ambassador to France, was commemorated in Paris at Théâtre Odeon, where a group of distinguished French actors gave a play entitled, *Le Bonhomme Richard*. The play was written by Louis Evan Shipman, American playwright, and the French translation was by Mlle Genevieve Pommerehne.

**April 13.** The 187th birthday of Thomas Jefferson was celebrated with appropriate exercises, conspicuously in New York City and Washington, D. C., under the auspices of the Thomas Jefferson Memorial Foundation. The setting aside of April 13 as "Religious Freedom Day" was strongly urged.

by a historical pageant and band concerts. The first feature of the programme was a "transportation parade," in which the modes of travel from colonial days down to the present were represented. They included a covered wagon, the pony express for carrying mails, the stage coach, both high and low bicycles, and automobiles, while airplanes, representing the latest method, soared over the town.

*August 9-10* The sesquicentennial of the events pertaining to the early history of Cooperstown, N. Y., were celebrated with a water regatta on Otsego Lake, and a historic pageant in which were presented scenes showing the arrival of William Cooper, founder of Cooperstown and father of James Fenimore Cooper.

*August 17* The village of Endicott, N. Y., commemorated its part in the Sullivan Expedition with a celebration which included historic pantomime, a parade, the dedication of a State monument, patriotic speeches, and a display of fireworks. It was in Endicott that General Poor, sent by Sullivan, met General Clinton with 250 boats of supplies and about 1600 men, coming down from Campharrie, and escorted him to Tioga Point, now Athens, where he joined forces with General Sullivan. The State of New York erected a monument with two markers telling the story of the Sullivan Expedition and its local significance.

*September 6* The 200th anniversary of the birth of the German philosopher Moses Mendelssohn, was celebrated throughout Germany, but most conspicuously in Dessau, Anhalt, where he was born, and in Berlin, where the official exercises were held under the auspices of the Berlin Jewish Community and the Academy of Jewish Science.

*September 12-15* The 200th anniversary of the founding of Baltimore, Md., was arranged by a committee of 400 citizens appointed by Mayor Broening with Henry B. Wilcox as chairman. On September 12, the programme was as follows: A spectacular military parade including portions of the Regular Army, National Guard, American Legion and marines and sailors from the war ship. During the evening, there was a bombardment of Fort McHenry in commemoration of the repulse of the British fleet in 1814. On September 13, in the afternoon, 80,000 persons gathered in the Municipal Stadium, where from 3000 to 5000 children gave a programme prepared by the Playground Athletic League. In the evening, the fraternal orders of the United Brotherhood of Carpenters and Joiners of America, Odd Fellows, Knights of the Ku Klux Klan, and other organizations, paraded with music and floats. On September 14, a mammoth pageant was held in the afternoon, it comprised 56 floats depicting the city's history and growth industrially, commercially, governmentally, educationally, and otherwise. On September 15, special commemorative services were held in the city churches, one of which, St. Paul's Protestant Episcopal, stands on the ground of its original site of 1730. In the evening, a public mass band concert was given.

*September 15* The sesquicentennial of the destruction of the Genesee Castle, or Sachem's Village, where 200 acres of corn and 1500 trees belonging to the Indians of the Six Nations were burned, was celebrated in Cuylerville, N. Y., the farthest western point reached by Gen. James Clinton, who commanded the militia on the expedition under Gen. John Sullivan. The exercises

included addresses and the presentation of historic features, the programme was organized under the State Education Department in co-operation with an advisory committee appointed by Governor Roosevelt.

*September 15* The 119th anniversary of the independence of Mexico was elaborately celebrated in the city of Mexico by a parade of 20,000 picked troops, a procession of airplanes, and various official receptions and other festivities. At midnight, President Portes Gil rang the ancient bell on the front of the palace and gave the famous "Long live Mexico" cry.

*September 15-21* The 142d anniversary of the signing of the Constitution of the United States was celebrated throughout the week. The American Legion actively cooperated with the American Bar Association and other similar organizations in making the celebration a success. Services on Sunday in the churches and addresses before various civic associations, many of which were broadcast over the radio, were conspicuous features of the celebration.

*September 21* The sesquicentennial celebration of the successes of the punitive expedition under Gen. John Sullivan against the Indians of the Six Nations was held in Geneva, N. Y., and included a historic pageant depicting the events of that period which led to the defeat of the Indians and the opening of the Finger Lakes region and the Genesee Valley to colonization. This and the other events connected with the Sullivan Expedition were honored by a commemorative two-cent stamp bearing a portrait of General Sullivan, issued by the United States.

*September 22* The 125th anniversary of the death of Commodore John Barry, father of the American Navy, was observed with memorial exercises on the mall in Central Park, New York City. Sailors and marines from the Navy Yard and delegations from veterans' organizations were present. The naval band played and a chorus of 150 school children sang patriotic selections. Similar exercises were held in Boston, Cleveland, and Chicago.

*September 27* On this date, Cardinal Hayes issued a letter to the rectors of the 444 churches in the Archdiocese of New York, directing that the entire month of October be dedicated "to the Supreme Shepherd, Pope Pius XI, in honor of the 50th anniversary of his holy priesthood." He said: "The recent historical events, namely, the signing of the Lateran pact and the emergence of the Pontiff from St. Peter's, after three-score years, arrested the attention and aroused the interest of the civilized world."

*September 28* The third and last part of "The Pageant of Decision," completing New York's celebration of the Sullivan-Clinton Sesquicentennial was held in Elmira, N. Y. Historic events showing General Sullivan's encounter with the Indians at the Battle of Newtown, which occurred in the vicinity of Elmira, were reenacted within a short distance of the one-time summer home of Mark Twain. It was estimated that from 60,000 to 75,000 persons were in attendance.

*October 5* Portugal celebrated the 19th anniversary of the founding of the Republic by reviewing sentences of 114 criminals and reducing the sentences of deserving long-term prisoners. President Camoens was the central figure in a parade, in which Portugal's best regiments marched down the Avenida Libertade in a ceremony ending at the monument to the national heroes of

the revolution of 1910. The monument was lavishly decorated with flowers.

**October 5** The 152d anniversary of the Battle of Germantown was celebrated by the dedication of tablets placed on buildings, walls, and boulders along Germantown Avenue, Church Lane, and Limekiln Pike, on the Chew House, where the battle opened, on the home of Caspar Wister Haines, and on other sites. A committee investigated records of the battle sites and arranged for the markers.

**October 9** The 150th anniversary of the death of Gen. Casimir Pulaski in Savannah, Ga., was elaborately celebrated, especially in Savannah, where the exercises began with a military mass in the park extension, a large military reservation in the center of the city. The military parade formed an escort for the priests and acolytes who took part in the mass which was celebrated by the Bishop of Savannah. The altar was an impressive sight, the Confederate monument towering behind it and palms on either side forming a picturesque setting. The United States flag formed a background for the candles and cross and also hung before the altar, with the French Tricolor on one side and the flag of Poland on the other. Later, two markers describing historic events were dedicated. Appropriate exercises were held also in New York City, Washington, D. C., Baltimore, Md., where the Polish Legion was recruited, Northampton, Mass. (where former President Coolidge unveiled a monument to Pulaski), Chicago, Ill., and elsewhere, at many of which Count Finances Pulaski represented the family and the Polish Republic. The Polish Alliance had much to do with the arrangements.

**October 12-18** The completion of the canalization of the Ohio River was celebrated by a Pittsburgh to Ohio trip of packets, with appropriate ceremonies including addresses at both Pittsburgh and Cairo. This great waterway of 1000 miles now has a depth of 9 feet and the Federal Government has already expended \$125,000,000 on the work. An address by President Hoover, pertinent to the event, was made at Louisville, Ky., on October 23. A commemorative two-cent stamp was issued by the Post Office Department in honor of the completion of this great step in the improvement of internal waterways.

**October 21** The 50th anniversary of the invention of the incandescent electric light by Thomas A. Edison was universally celebrated throughout the world as "Light's Golden Jubilee." In the United States, the celebrations culminated in Dearborn, Mich., where President Hoover, Thomas A. Edison, Owen D. Young, and others were the guests of Henry Ford who had purchased the original Edison laboratory at Menlo Park, N. J., and recreated it as a unit in his industrial museum. The original scene of exhibiting the lamp was recreated and addresses in tribute to the occasion were broadcast around the world by radio. See also *June 3*.

**October 27-November 2** The 250th anniversary of the settling of Trenton, N. J., was celebrated with a week of pageantry, sport, and speech making. These exercises began with patriotic church services and were followed on October 28 with parades of the police and fire departments, and civic organizations. Tuesday was given over to parades of school children, and Wednesday was pageant day, when more than 50

floats depicting events in the history of Trenton from the time of Mahlon Stacy's (the first settler) journey up the Delaware until a period of about 50 years ago. The closing event, were a parade of the volunteer firemen's organizations from New Jersey and nearby States, and a speedboat regatta on the Delaware River. An exhibit of Trenton's industrial accomplishments was a feature of the celebration and was continued for two weeks.

**November 10** The 25th anniversary of the Battle of Grzybow, the first contest of the Poles against the Czarist government since 1863 was celebrated in Warsaw, Poland, by military parades with open-air gatherings at which addresses were made by Marshals Pilsudski and Daszynski.

**November 30** The sesquicentennial celebration of the coming to Morristown, N. J., by the Continental Army was celebrated by parades of military organizations and members of patriotic societies, pageants with parades in costumes, and floats Washington's headquarters—the Ford Mansion—is now preserved as a museum and contains a large collection of relics of the War of the Revolution.

**December 13** The 100th anniversary of the founding of the *Revue des Deux Mondes* France's oldest literary monthly, was celebrated in Paris at the Sorbonne with a series of addresses.

**December 17** The centenary of the independence of Venezuela was celebrated throughout that country, but chiefly in Caracas with a series of patriotic demonstrations, parades, and fiestas.

**December 23** The golden jubilee of the ordination to the priesthood of Pope Pius XI was celebrated in all the churches and chapels of the Archdiocese of New York with a solemn mass of thanksgiving.

**MASSACHUSETTS BAY TRICENTENARY** Under this name, an organization of citizens chartered by the Commonwealth had in active preparation for the commemoration in 1930 of the 300th anniversary of the establishment by the Puritans of the Bay Colony in New England, 1630. In this celebration, Massachusetts was to set a new mode for observance of notable anniversaries. Instead of a world's fair, with artificially created central exposition all the State and section was to become the fair grounds with 50 centres of special attraction besides the scores of historic places and scenes that Massachusetts has made part of America's life and an inspiration to the world. There were to be patriotic pilgrimages, pageantry, parades, music, amusements, sports, ocean and mountain recreation, reunions, old-time manners and customs reproduced for contrast with the present State-wide open house to nation and world was to be maintained. Three centuries of contributions made since the Puritans planted and rooted free government on this continent, were to be displayed and reviewed, cultural, industrial, educational, spiritual, social, civic. It was estimated that more than 100 towns, cities, and organizations in Massachusetts were to have special programmes. A monthly journal, the *Tricentenary News of 1930*, has been published since July, 1929.

**WASHINGTON BICENTENNIAL COMMISSION** In accordance with the bill passed by Congress (see *YEAR BOOK* for 1928, page 142), bids were obtained for the preliminary work on the George Washington Memorial Highway authorized by Congress to extend along the Potomac River

from Washington to Mount Vernon at a cost not to exceed \$4,500,000. This Highway will be 15½ miles long, with a right-of-way 200 feet wide, except in Alexandria, and with a 40-foot pavement and two 10-foot shoulders. Seven or eight masonry bridges will be constructed, monumental in design and harmonizing with the Arlington Memorial Bridge now being built, to provide a direct route between Washington and Arlington National Cemetery at a point below the Lee Mansion. The masonry bridges will carry a 60-foot roadway with a 5-foot sidewalk on each side. Automobile parking spaces will be provided at nine places on the route. Starting at the Virginia end of the Arlington Memorial Bridge, the roadway will traverse Columbia Island, pass under both the highway bridge and the shore space of the Southern Railroad Bridge over the Potomac, on the outskirts of the capital, and follow the Potomac, as closely as topography, alignment, grades, and plans for future development will permit, to the postern gates of Mount Vernon.

According to Senator Fess, vice chairman of the commission, the programme committee has two tasks awaiting it. First, to make suggestions as to how communities throughout the United States should observe the bicentennial year, and second, to make direct arrangements for the national celebration at the seat of government. Arrangements for celebrations throughout the United States will be left to the States, but the commission probably will offer certain suggestions to State, county, and municipal authorities, as for example, the commission may recommend to county officials throughout the land that a week be designated for George Washington Bicentennial exercises in the schools. With regard to the prospect for great physical improvement in the appearance of the national capital before 1932, the approval by Congress of plans for beautification of Union Station Plaza was encouraging. Two coats of arms of George Washington's ancestors had been obtained in England by Dr. Albert Bushnell Hart, historian of the commission, and were to be brought to the United States by him in connection with preparations for the celebration in 1932.

**CELL** See ZOOLOGY

**CELTIC LITERATURE.** See PHILOLOGY, MODERN

**CEMENT** The preliminary estimates of production for the Portland cement industry for the United States indicated for 1929 a total of 170,198,000 barrels, as compared with 176,290,000 barrels in 1928, or a decrease of 3.5 per cent. The shipments in 1929 aggregated 109,394,000 barrels, as against 175,838,000 barrels in 1928, or a decline of 37 per cent. At the end of the year, the stocks on hand at the various plants amounted to 23,519,000 barrels, as compared with 22,918,000 barrels at the end of 1928. At the close of December, 1929, the total output of finished cement, as compared with the estimated capacity of 165 plants, was 51.5 per cent, as compared with 60.4 per cent for 159 plants at the close of December, 1928. The relation of production to capacity for the calendar year 1929 was 66.4 per cent, as compared with 74.0 per cent in 1928. The accompanying table gives the production and shipments of finished portland cement by districts in 1929 and 1928.

In addition to Portland cement, the production of clinker (unground Portland cement) in 1929

was 168,988,000 barrels, as compared with 173,742,000 barrels in 1928. The accompanying table shows the production and stocks at the end of the month by district. In 1929 the imports of hydraulic cement aggregated 1,727,900 barrels valued at \$1,938,240 as compared with 2,284,085 barrels valued at \$3,090,860 in 1928, while the exports in 1929 amounted to 886,172 barrels valued at \$3,083,911 as compared with 821,650 barrels valued at \$2,938,702 in 1928.

**ESTIMATES OF PRODUCTION AND SHIPMENTS OF FINISHED PORTLAND CEMENT IN 1929 AND 1928, BY DISTRICTS**

\* The inclusion of Wyoming begins with April, 1929, of Idaho with June, 1929, of Arkansas with September, 1929.

**CENSUS, FEDERAL.** The Fifteenth Decennial Census to be taken in 1930 was provided for in the amended bill which passed both Houses of the special session of Congress called in April, 1929, and which was signed by President Hoover on June 18. It provided that "a census of population, agriculture, irrigation, drainage, distribution, unemployment, and mines shall be taken by the Director of the Census in the year 1930 and every 10 years thereafter." The Census of Manufactures for 1929, which also was to be taken in 1930, was provided for by a section of the law which directed that the statistics of manufacturing industries should be collected and published every second year after 1927. According to the 1929 Census Act, the population and agricultural censuses should be taken as of April 1, 1930; and it was required that the 100,000 enumerators should complete their work within two weeks in all cities having more than 2500

inhabitants and within 30 days in all other places Cooperative arrangements also were made with various organizations and government bureaus, including the Bureau of Indian Affairs, for the enumeration of Indians on reservations, the Foreign Service division of the State Department, for the enumeration of American citizens employed in the foreign service of the Government the War Department, for the enumeration of Army posts, the Navy Department, for the enumeration of the officers, sailors, and marines at naval bases and on naval vessels, the National Park Service, for the enumeration of persons in the national parks, the Bureau of Lighthouses, for the enumeration of persons on lightships and

that were not accessible to enumeration. The Bureau of Navigation and steamship companies, for the enumeration of persons employed on mercantile vessels, and the Bureau of Mines, for the census of mines.

The 1929 Census Act was the first since 1850 to combine the census and congressional apportionment. According to the report of 1929 of the Director of the Census, it provided that after each census the President should transmit to Congress "a statement showing the population of the several States as ascertained by the census and also the number of Representatives to which each State will be entitled under an apportionment of the then existing number of Representatives (at present 435) by each of the following methods: (1) By the method used in the last preceding apportionment, (2) by the method known as the method of major fractions, which happens at this time to be the same as (1), and (3) by the method known as that of equal proportions. If the Congress to which this statement is submitted fails to pass a law apportioning Representatives, the apportionment by method (1) as announced by the President goes into effect. But if the statement required from the President is not submitted within one week after Congress meets in regular session following the census, these provisions of the law have no effect." This was the first census law to provide that the results of the census should be sent to Congress by a specified time.

The population census scheduled to be used in 1930 was to be, in the main, the same as that used in 1920 and earlier censuses, most of the 25 to 30 questions covering such basic and essential information as age, sex, color, marital status (whether single, married, widowed, or divorced), nativity and nativity of each parent, and occupation. It also was to carry questions as to literacy, school attendance, and ability to speak English and, in the case of the foreign-born, whether naturalized or alien and the year of immigration to the United States.

For the information of the Veterans' Bureau, two new questions had been proposed to ascertain whether the person enumerated was a war veteran and, if so, in what war he had served. There also were two questions as to whether or not the person was living on a farm at the time of the census and whether he was living on a farm a year ago, which, taken in conjunction, would afford the basis for statistics of migration to and from the farm. Another new question on the population schedule related to unemployment, a supplementary sheet carrying additional questions which must be filled out for any person usually engaged in a gainful occupation who was not employed at the time of the census.

The agricultural schedule contained 375 inquiries, covering such questions as acreage, classes of farm land, such as crop and pasture land, the tenure under which the farm was operated, total value of the farm with separate items for buildings, dwelling houses, implements and machinery, farm debt, principal farm expenses, land drained, farm machinery and facilities such as automobiles, tractors, telephone, radio; quantity produced of all major crops and most of the minor ones, various kinds of domestic animals on the farm, including age and sex, and other data. In addition, a supplemental schedule was prepared, at the request of agricultural interests in the States of California and Florida, which included inquiries concerning certain subtropical fruits, and another supplemental schedule, prepared especially for use in the West, contained 250 inquiries as to irrigated crops.

The provision for a census of distribution was incorporated in the 1929 Census Act in response to a general demand for basic data that would throw light upon the important problem of eliminating unnecessary economic waste in the distribution of commodities. The test census, taken in 1927 in 11 cities, developed important facts in regard to the sale of commodities by retailers, wholesalers, brokers, and similar agencies, but it included no data relating to the sale of commodities by one manufacturer to other manufacturers for use in assembling or for the purpose of fabricating other products. The census was to be taken in cities at an earlier date than that for the enumeration of the population and by special enumerators selected for the work.

The population, agricultural, and industrial censuses, although of great magnitude, are only a part of the many activities of the Bureau of the Census, which issues regular periodical inquiries involving the compilation and tabulation of data in regard to births and deaths, marriages and divorces, persons in Federal and State institutions, such as prisons and reformatories, institutions for mental patients, and institutions for the feeble-minded and for epileptics, electrical industries, including electrical railways, telegraphs, telephones, and central electric light and power stations, financial transactions of States and cities, forest products, including the production of lumber, laths, shingles, wood pulp, and current production of numerous commodities, such as fats and oils, hides, skins, and leather, boots and shoes, leather gloves and mittens, wheat and flour, wool and wool manufactures, hosiery and knitted underwear, etc. The bureau issues the *Monthly Survey of Current Business* in which are brought together current reports of business activities, emanating from both governmental agencies and representative private organizations, including trade associations. During 1929 it published the following monographs: *Growth of Manufactures*, by Edmund L. Day and Woodhief Thomas, *Earnings of Factory Workers, 1896 to 1927*, by Paul F. Brissenden, *Women in Gainful Occupations*, by Joseph A. Hill, and *Ratio of Women to Children*, by Warren S. Thompson. The director of the Bureau of the Census in 1929 was W. M. Stewart. See STATISTICS and under article on UNITED STATES.

**CENSUS, WORLD AGRICULTURAL** See AGRICULTURE.

**CENTRAL AMERICA.** The term generally applied to the southern portion of the North

American continent lying to the north of the Panama Canal and south of Mexico and consisting of the five states, Costa Rica, Guatemala, Honduras, Nicaragua, and Salvador. See the articles on these respective countries. See EXPLORATION.

**CENTRAL STATIONS** See DYNAMO ELECTRIC MACHINERY. POWER PLANTS. STREAM.

**CENTURY OF PROGRESS** See EXPOSITIONS.

**CEREALS** See BARLEY, OATS, RYE, WHEAT. **CEREBRO-SPINAL FEVER.** See MENINGITIS, EPIDEMIC.

**CEYLON**, sĕ-lŏn' An island in the Indian Ocean off the southern extremity of Hindustan, belonging to Great Britain. Capital, Colombo. Its extreme length from north to south, i. e. from Point Palmyra to Dondra Head, is 266 miles, its greatest width 140½ miles from Colombo on the west coast to Negombo on the east coast. Area, 25,332 sq. miles. Population, at the census of 1921, 4,504,549, as compared with 4,106,350 in 1911, estimated at the end of 1927, 5,288,792. In 1921 there were 8099 Europeans, 29,403 Europeans, or Dutch descendants, and other Eurasians, and the remainder of the population comprised Singhalese, Tamils, Moors, Malays, Veddas, and others. The registered movement of population in 1927 was as follows: Births, 205,170, deaths, 113,007 marriages, 30,566. The chief cities with their populations in 1921 were Colombo, 244,163, Jaffna, 42,136, Galle, 39,073, and Kandy, 32,047. The number of vernacular schools in 1927 was Government schools, 1130, attended by 114,856 boys and 57,892 girls, aided schools, 1876, attended by 137,863 boys and 90,775 girls, unaided schools, 416, attended by 12,207 boys and 6825 girls, English and Anglo-vernacular schools, 423, attended by 63,539 boys and 17,783 girls.

Ceylon is almost entirely agricultural and specializes in export crops. Plantation tea, rubber, and coconuts make up the bulk of its products, but considerable amounts of cacao, cinnamon, citronella grass, and miscellaneous products are grown, largely by individual native farmers. Considerable rice also is raised but more than half of the country's total consumption of this food supply is imported from India and other sources. Specializing in export crops as Ceylon does, its export record is an excellent gauge of its prosperity. Tea is the ranking product of the island, but rubber is rapidly approaching it in value of output.

The volume of foreign trade in 1929 amounted to \$208,045,000 as compared with \$294,134,000 in 1928. Imports for 1929 totaled \$145,489,000 and exports, \$152,556,000. The increase in Ceylon's total trade is indicated by the fact that in 1913 it amounted to \$144,835,000 and in 1922, to \$193,174,639. About one-third of the total trade is carried on with the United Kingdom, one-third with the other British dominions and possessions, and one-third with all other countries. In 1927, 41 per cent of the exports went to the United Kingdom, 17 per cent to other British dominions, and 41 per cent to all other countries, including 25 per cent to the United States. About 15 per cent of Ceylon's total trade is carried on with the United States, but the latter country furnishes only about 3 per cent of Ceylon's imports. The principal products of Ceylon, with the value of the respective exports in 1927, are tea, \$77,174,957, rubber,

\$46,843,924, copra, \$11,406,326, coconut (desiccated), \$7,395,221, coconut oil, \$5,980,062, cinnamon, \$1,727,885, ateca nuts, \$1,083,490, coir fibre, \$1,040,869. Other products are cacao, palm-oil, corn yarn, skins, fresh coconuts, citronella oil, coconut product, endonims, and pupani. Husked rice, cotton piece goods, wheat products, sugar, raw cotton, coal, oils, iron and steel manufactures, and automobiles and vehicles constitute the chief imports. Livestock in 1927 included 1500 horses, 1,588,000 horned cattle, 60,000 sheep, 51,000 swine, and 176,000 goats.

Plumbago is the chief mineral mined, 67 plumbago mines worked in 1927 having an output of 258,000 cwt. Gold, thomium, and monazite exist and there are small gem quarries producing sapphires, rubies, moonstones, etc. In 1927 there were about 1600 tea, rubber, and cacao factories, 1400 cinnamon, citronella, coconut, fibre oil, and other factories, and some 20 sawmills.

For the fiscal year ending Sept. 30, 1927, the revenues totaled £8,623,928 and the expenditures, £8,069,753. The net public debt on Sept. 30, 1927, was £3,628,543, incurred entirely for public works. Shipping cleared and entered from Ceylon ports in 1927 totaled 20,103,000 tons (British, 12,381,000 tons). In 1929 the island had 1125 miles of government-owned railway line, of which 704 miles were main lines. In 1927 operating revenues were \$10,888,900 and operating expenditures, \$7,171,062. There was an excellent system of roads 4238 miles in length, of which 3644 were surfaced. The mileage of telegraph wire was 9771.

**GOVERNMENT** The administration as embodied in an Order in Council of December, 1923, was in the hands of a Governor, aided by an executive council of nine members, and a legislative council of 49 members (12 official and 37 unofficial). Of the unofficial members, 23 are elected to represent the territorial divisions, two to represent the Europeans, two the Burgher community, one the Chamber of Commerce, one the Western Province Tamils, three the Mohammedans and two the Indians. Subject to the approval of the legislative council, a new system of government proposed by a special commission was approved in November, 1929, by Lord Passfield, the British Secretary of State. A representative Chamber elected by the suffrage of all adult males and of women over thirty and with legislative and executive functions was provided for. Government departments were divided into ten groups, the chairman of which would have the standing of ministers. Seven of the chairmen would be elected by a revised legislative council of 50 elected members, eight nominated unofficial members, and the Colonial Secretary, Attorney-General, and Secretary. Powers of veto were reserved to the Governor. The former system of communal representation was abolished. The suffrage was formerly restricted to about 4 per cent of the population. The changes approved were formulated in response to administrative difficulties involved in the former system and in a larger measure of self-government for the native population. Governor in 1929, Sir Herbert James Stanley.

The Maldivé Archipelago, consisting of 13 coral islets, 100 miles west of Ceylon, is tributary to Ceylon. They are sparsely settled by a mixed race of probably pure Aryan stock and governed by a native Sultan. The islands are cov-

ered with coconut palms, and yield millet, fruit, and coconut produce. The population numbered over 70,000 in 1921. The islanders are civilized and are great navigators and traders.

**CHAMBERLAIN, EUGENE TYLER** American editor and official, died in Baltimore, Md., Oct. 8, 1929. He was born in Albany, N. Y., Sept. 28, 1856, and was graduated from Harvard. He engaged in editorial work during 1882-93, in which time he was associate editor of the *Albany Journal*, political correspondent at Albany for Boston, New York, Philadelphia, and Washington papers, and editor of the *Albany Times*. During 1893-21 he was commissioner of navigation in the U. S. Department of Commerce. He was the American delegate to the International Conference on Safety at Sea, held in London in 1913.

#### CHAMBER MUSIC SEE MUSIC

**CHAMBER OF COMMERCE OF THE UNITED STATES** A national federation of more than 1600 business organizations, established in 1912 primarily as a vehicle for the expression of national business opinion on important economic questions. The President of the United States and other government officials aided in its organization and it has since served as an agency for the cooperation of business and government in the furtherance of national economic policy, holding itself ready at all times to advise the government regarding the needs of business and the possible economic effects of legislative measures.

The members of the chamber are trade associations and local or regional chambers of commerce, these groups being represented on a board of directors composed of 34 members chosen from geographical districts or specific fields of business and elected for a term of two years. The membership in 1929 consisted of 1776 business organizations, 10,705 individual members, and 12,494 associate members. The policies of the organization are formulated only by resolutions adopted at its meetings or by direct referendum in order that they may reflect as accurately as possible the opinion of all classes of business represented in the constituent membership. Among the questions to which the chamber directed its attention during the year were: The tariff, foreign trade policies, tariff legislation, produce exchange trading, reduction of government in business, reorganization of Federal government departments and agencies, voluntary consolidation of railroads, relief for the Interstate Commerce Commission and continuance of its rate-making authority, modernization and codification of American navigation laws, adherence of the United States to the protocol of the Permanent Court of International Justice, prudent reduction of armaments, and tax revision.

For the convenience of its members the chamber maintains at its national headquarters 12 service departments covering the main divisions of business activity. The agricultural department aids local chambers of commerce in the solution of agricultural problems and the enhancement of trade area prosperity. The civic development department aids business men to approve not only local municipal and civic development but also matters of general national importance. The commercial organization department assists member chambers in strengthening their organization and extending their usefulness to the communities which they serve. The department of manufacture aims to assist local

chambers with their problems of industrial extension. The domestic distribution department attempts to distribute in a scientific manner the costs of distribution. It also has cooperated with the U. S. Bureau of the Census in working out a distribution census so as to obtain an accurate account of the channels of distribution, wages of employees, and volume of business in different parts of the country. The finance department studies methods of Federal, State, and local taxation and problems of corporation and international finance. The foreign commerce department deals with tariff policies and import and export prohibitions and restrictions. The insurance department is concerned with life extension and in 1929 inaugurated an inter-chamber health conservation contest; it also continued the inter-chamber fire-waste contest in which more than 660 local chambers and similar organizations participated in 1929, showing a decreased fire loss of more than \$13,500,000. The natural resources production department attempts to promote proper use of water power, oil, coal, forest, and other natural resources. The trade association department serves as a clearing house as to the activities which a local association can carry out most effectively. The transportation and communication department studies problems of rail, highway, waterway, and air transportation and of postal service and electrical communications. The research department covers the general field of economic research. The chamber also publishes a monthly magazine *The Nation's Business* and issues from time to time reports on economic subjects.

The seventeenth annual meeting of the chamber was held in Washington April 30 to May 3, 1929. The officers elected for 1929-30 were: President, William Butterworth of Moline, Ill.; chairman of the board, Julius H. Barnes of New York City; vice presidents, A. J. Brosseau of New York City, W. Ruess Abbott of Chicago, Robert R. Ellis of Memphis, Paul Shoup of San Francisco, Charles W. Lonsdale of Kansas City; treasurer, John Joy Edson of Washington; secretary, D. A. Skinner of Washington. National headquarters are in Washington with divisional headquarters in New York City, Atlanta, Chicago, Minneapolis, Dallas and San Francisco.

**CHAMPIONSHIPS** SEE AMATEUR BOXING and other sport titles.

**CHAUTAUQUA INSTITUTION** An educational movement established in 1871 by Lewis Miller and Dr. John H. Vincent, both prominent in the Methodist Episcopal Church. The institution is nonsectarian in principle although the original idea of the organization was a Sunday school for teachers where a series of correlated lectures and entertainments were presented during the months of June, July, and August. The three general fields of activity are the general assembly, consisting of an educational and popular series of lectures and addresses, concerts, dramatic entertainments, etc.; the summer schools, offering courses of formal classroom instruction and a home reading circle in which a set of four books is designated for reading during the year, in addition to a news narrative appearing in a monthly review. In 1929 there were 18 departments in the summer school, with 125 instructors and approximately 2,500 students, while the attendance at the annual session was estimated at 45,000. Financial support is obtained largely through individual gifts

Permanent buildings, valued at \$1,250,000, are owned by the institution in Chautauqua, N. Y., where the general summer assemblies are held and the Chautauqua Press is located. Officers in 1929 were George E. Vincent, honorary president, Arthur I. Heister, president, William L. Ransom, chairman of trustees, Shailer Mathews, chairman of the executive board, Charles E. Pearce, secretary, and Jessie M. Leslie, treasurer.

**CHECKERS.** The American Checker Association held its seventh annual tournament at Cedar Point, Ohio, in August. This meeting was the outstanding event of the year 1929, as it was in the preceding year to the followers of draughts in the United States. The championship was won by Asa Long, of Toledo, Ohio, who had also captured the crown in 1922. Louis T. Bailey of Brooklyn finished in second place. The other prize winners were Basil Case, of Chicago, third, N. Rubin, Detroit, fourth, E. F. Hunt, Nashville, fifth, W. Ryan, New York, sixth, J. B. Hanson, Flint, Mich., seventh, Saul Weslow, Boston, and H. S. Reynolds, Buffalo (tie), Gny (Gaimood, Fort Recovery, Ohio, tenth.

**CHEESE.** See DAIRYING.

**CHEMICAL INDUSTRY, SOCIETY OF** See (CHEMISTRY, INDUSTRIAL.

**CHEMICAL SOCIETY, AMERICAN.** See (CHEMISTRY, INDUSTRIAL.

**CHEMISTRY.** A review of the literature of chemistry for the year 1929 fails to reveal any outstanding announcement worthy of conspicuous notice. The advance is evident and it is shown by the ever-increasing contributions, giving the results of studies contained in the journals devoted to this branch of science, some of which are presented in the following paragraphs.

An event of more than passing interest was the presentation in Washington on October 30 of a draft for \$50,000 to Miss Marie Curie by President Hoover on behalf of a number of admirers in the United States. The money was for the purchase of a gram of radium to be used in the further investigation in the Curie Cancer Hospital and Laboratory in Warsaw, Poland.

**NEW ELEMENTS.** The isolation of no new element was reported during the year, but at the September meeting of the American Chemical Society the remarkable announcement was made by K. F. Bollnhoeffer that hydrogen, which had hitherto been regarded as indivisible was a mixture of two gases, which may be called parahydrogen and ortho-hydrogen. See CHEMISTRY, INDUSTRIAL.

**ATOMIC WEIGHTS.** New determinations of atomic weights make possible more exact analytical methods and there are those who devote their attention to the calculations of these important factors. Among the more recent results were the following:

The most probable value of the atomic weight of cerium was found by O. Hönigschmidt and H. Holch (*Zeit. anorg. Chem.*, vol. 177, p. 91) to be  $140.125 \pm 0.007$ . An interesting series of determinations of the atomic weight of copper from the Lake Superior region and from Chile by T. W. Richards and A. W. Phillips (*Jour. Amer. Chem. Soc.*, vol. 51, p. 400) gave 63.557 independent of the  $\text{Cu}_2\text{O}$  method. The metal O. Hönigschmidt (*Zeit. anorg. Chem.*, vol. 178, p. 1) continued their work on fundamental atomic weights and find

that the mean of five determinations gave  $107.880 \pm 0.001$  as the atomic weight of silver. For barium, they found as the mean value from five determinations 137.355. The atomic weight of phosphorus from determinations of the density and compressibility of phosphine according to M. Ritchie (*Nature*, vol. 123, p. 838) is 30.97 and 30.98. According to G. P. Baxter and S. Ishimaru (*Jour. Amer. Chem. Soc.*, vol. 51, p. 1729), terrestrial and meteoric nickel have identical isotopic compositions. They find the atomic weight of nickel to be 58.694. The atomic weight of arsenic from an analysis of arsenic trichloride is 74.937 according to H. Krepelka (*Nature*, vol. 123, p. 944).

**ANALYTICAL CHEMISTRY.** Analysis is the key by means of which the composition of chemical compounds is determined and improved methods of analysis and new forms of apparatus are valuable advances in the progress of science. An automatic pipette which is described by M. Hyman (*Jour. Soc. Chem. Ind.*, vol. 47, p. 368T) is said to be a modification of an ordinary pipette which is filled by suction as usual, but in which the level of the liquid is brought automatically to the graduation mark. The following improvements in Dubsky's micro-method for nitrogen determination are described by S. Okido (*Bull. Inst. Chem. Res.*, Tokyo, vol. 8, p. 2): (a) By passing carbon dioxide through the preheated combustion tube while still hot, to avoid occlusion of air, and (b) by use of a three-way cock between the carbon dioxide generator and the bubble counter. C. Dhier (*Bull. Soc. Chem.*, vol. 45, p. 183) describes a reaction tube as follows. The two components of a reaction are separated by placing the one in a small test tube which rests on three indentations inside a larger tube containing the other reactant. The larger tube is sealed off, and the reaction brought about by inverting the tube. The coloring matter of the juice of the black mulberry (*morus nigra*) according to L. Mosendz (*Zeit. anal. Chem.*, vol. 77, p. 37) may be used as an indicator in acidimetry, the colorations in acid and alkaline media being red and green, respectively. It is found that the most accurate results are obtained when acids are titrated with alkalis.

R. E. Zinn (*Ind. Eng. Chem.*, vol. 1, p. 112) describes a new air separator for the laboratory in which the powder to be separated is carried by an air stream into the annular space between two cylindrical containers, when the velocity is depressed sufficiently to cause deposition of coarser particles. The air then enters the inner container, where finer particles are deposited. Escaping dust is arrested by a muslin filter. It was found by S. R. Benedict (*Jour. Biol. Chem.*, vol. 82, p. 1) that picric acid, for the purpose of the colorimetric determination of creatinine, is best purified by crystallization from glacial acetic acid, or by solution in sodium carbonate, and then decomposition of the latter with dilute hydrochloric acid. R. A. Van Linge (*Chem. Werkblad*, vol. 26, p. 301) describes a simple viscosimeter as consisting of a pipette having a capillary tube in place of the lower limb and provided at the upper end with a three-way tap, which permits of easy filling to a constant level, a half turn allows the measured quantity to flow through the capillary tube. For the determination of very small quantities of mercury, A. Stock and W. Zimmerman reported (*Zeit. angew. Chem.*, vol. 42, p. 429) that the effect of

carbamide in the colorimetric determination by means of diphenylcarbazone is apparent if the acidity of the test solution is kept low. A new type of ionization electroscrope is described by B. F. J. Schonland (*Proc Camb Phil. Soc.*, vol. 29, p. 340) which combines a high voltage-sensitivity with a small capillary, and has a sensitivity for quantity of electricity of the same order as a combination of an ionization chamber and a Compton electrometer.

**BIOLOGICAL CHEMISTRY.** The application of chemistry to the many phases of life is a fascinating study. There are those who believe that life may be generated in a proper chemical environment as was indicated by the experiments of Jacques Loeb, while others are dubious.

Some of the results published during the year are given in the following paragraphs. According to E. Sadolin (*Biochem Zeit.*, vol. 201, p. 323) the arsenic of fish occurs principally in the fat soluble compounds. The arsenic compounds appear to be acidic, since they are extracted by a weakly alkaline solution along with the fatty acids. The concentration of arsenic is higher in the liver of fish than in muscular tissue. The oil extracted from tissue contains more arsenic than the tissue itself. The arsenic content of fish bears no relation to their oil content. G. Pfeiffer finds (*Biochem Zeit.*, vol. 201, p. 298) in determining small amounts of iodine in organic compounds that fatty acids which would otherwise distill into the receiver are intercepted by a special condenser from which the condensate can be run off. They are received in dilute potassium hydroxide solution and removed as calcium salts.

According to R. P. Kennedy and G. H. Whipple (*Amer Jour Physiol.*, vol. 87, p. 192) spectrophotometric analysis of chicken-blood hemoglobin showed it to be identical with dog-blood hemoglobin. The muscle-hemoglobins of the two animals were also found to be identical. The announcement is made by M. Goldzicher (*Klin Woch.*, vol. 7, p. 1124) that a physiologically active substance, called interrenin, which when injected intravenously reduces arterial blood pressure and causes a decrease of blood-lipids, has been prepared from the suprarenals. For the detection of bile pigment in urine, L. Van Itallie (*Pharm Weekblad*, vol. 60, p. 13) recommends that the pigment be absorbed on filter paper or talc, and after washing with water, removed again in acid alcohol solution, also that treatment of the solution with an oxidizing agent gives the characteristic green coloration.

It is reported by S. Loewe, H. E. Voss, F. Lange, and A. Wahner (*Klin Woch.*, vol. 7, p. 1376) that testicular hormone is present in the urine of males, although it does not respond to the Allen-Dossy test. Testicular and ovarian hormones can be separated by fractionation. The following process is recommended by S. Kannegger (*Pharm Weekblad*, vol. 60, p. 129) for the preparation of urea from urine. The urine is shaken with from 2 to 3 per cent of nitric acid, filtered, evaporated to one-sixth of its original volume, cooled, and treated with nitric acid. Pure urea is obtained directly. The base is obtained by treatment with barium carbonate and extraction with alcohol.

A comparison of analytical data of sound spruce and spruce decayed by the action of the fungus *Merulius lacrymans* was made by G. C. Barton-Wright and J. G. Boswell (*Biochem. Jour.*, vol. 23, p. 110). They found that there

was a removal in the latter of galactan, mannan, and cellulose fractions. The hemicelluloses and lignin are not affected by the fungus. E. N. Harvey (*Plant Physiol.*, vol. 123, p. 315) reported that certain marine algae can produce oxygen, which may be detected by luminous bacteria, from carbon dioxide when illuminated in absence of oxygen. It is found by F. W. Went (*Proc. K. Akad. Wet.*, Amsterdam, vol. 32, p. 35), that a hormone which is able to promote root formation and is nonspecific and resistant to heating at 100° C may be extracted from leaves of *Acalypha* and from germinating barley. That the action is nonspecific was shown by the fact that the root-forming substance produced from leaves of *Caros papaya* promoted root formation in *Acalypha*. This substance seems to be transported by the phloem and is found in leaves and sprouting buds and in considerable quantities in branches.

According to E. J. Bigwood and A. Wuilott (*Compt rend Soc Biol.*, vol. 99, p. 352), the difference in reducing power of blood-serum before and after acid hydrolysis is no proof of the presence of a protein sugar. The chemical examination of a mummy from the Vatican Museum according to A. Tuile (*Atti R. Acad. Lincei*, vol. 9, p. 223) showed absence of nitre, arsenic, heavy metals, and bitumen, from which the author assumes as probable that natural balsams only were used in the mummifying process.

Bounhol reported (*Compt rend.*, vol. 188, p. 1340) that guinea pigs in 80 per cent oxygen died within two or three days. Under such circumstances death is accompanied by increase in the soluble nitrogen compounds of the blood. The ease of obtaining oxygen retards circulation so that the metabolic products accumulate and cause death. According to Kurishita (*Chem. Zentr.*, vol. 2, p. 237), shed blood contains more bilirubin than circulating blood. It is his belief, therefore, that most of the bilirubin is formed outside the liver. The presence of nickel in gelatin has been traced according to A. Martini (*Mikrochem.*, vol. 7, p. 235) to the bones used in its manufacture. Nickel is apparently a normal constituent of bones. From his experimental observation, E. Schilling (*Chem. Zentr.*, vol. 2, p. 760) deduces the belief that catalase, by protecting tissue from the oxidizing action of peroxide, may be accepted as a protective enzyme. B. Buchholz reports (*Chem. Zentr.*, vol. 1, p. 188) that iodine was found in all of the human organs examined, although individuals showed differences. The thyroid gland contains the most iodine, the adrenals, ovaries, thymus, and sometimes the spleen contain fairly large amounts. He finds that chronic pathological conditions affect the values. The total iodine content of the human body varies considerably around 11 mgr. It has been found by G. Fricke (*Zeit. ges. exp. Med.*, vol. 64, p. 81) that by simultaneous administration of dextrose and insulin to the normal dog the dextrose threshold of the kidneys is diminished. In the pancreas of a diabetic dog, the renal elimination of sugar is increased by the action of insulin with diminishing blood-sugar.

**GENERAL CHEMISTRY.** Under this heading are mentioned some of the advances reported during the year that pertain to the chemistry of the mineral elements or compounds, as distinguished from the organic compounds.

F. Ashton in an interesting article (*Nature*,

vol 123, p. 488), claimed that there was no evidence that oxygen is other than a simple element and cites the fact that faint lines which might be ascribed to the existence of  $O^+$  are capable of other interpretations. E. W. R. Steacie and F. J. Toole (*Jour Amer Chem Soc*, vol 51, p. 1134) report that very pure silver which has been fused and kept just below the melting point for several days and then cooled very slowly dissolves nonuniformly in dilute nitric acid, gradually assuming the shape of an octagonal prism. The  $O^+$  ions do not come into contact with oxygen during the operations. The crystal form of the prism is briefly described in this paper.

In a study for the interpretation of the atmospheric absorption bands, W. F. Giauque and H. L. Johnston (*Jour Amer Chem Soc*, vol 51, p. 1436) found that the weak band in the atmospheric absorption bands for oxygen originates from oxygen molecules each consisting of an atom of mass 16 combined with an atom of mass 18. G. Klein (*Zeit anorg Chem*, vol 180, p. 306) presents a historical survey of the problem of the genesis of the actinium family of elements. According to this paper, all the known facts support the view that the actinium series is derived from a radioactive isotope of uranium, actinouranium, which must have an atomic weight of 238. A study of the continuous spectrum of the hydrogen atom by S. P. Epstein and M. Minskai (*Proc Nat Acad Sci*, vol 15, p. 405) resulted in the publication by the authors of expressions suitable for numerous calculations by means of a new integral representation for the wave function. These results were also applied to the calculation of the absorption spectra of hydrogen beyond the limits of the Balmer and Lyman series, as well as certain limiting values of the absorption. H. J. Schumacher and G. Spengler presented in an interesting paper (*Zeit anorg Chem*, vol 42, p. 697) the evidence published for and against the existence of the compound cerium monoxide ( $NO$ ).

K. L. S. (Wass Veroff *Stemanns Kong*, vol 8, p. 26) published a valuable review of the literature dealing with the physical properties of beryllium and its behavior toward acids, bases, gases, and various oxides. The trivalent rare-earth metals of the cerium group, according to G. A. Barbieri (*Atti R Acad Lincei*, ser 6, vol 9, p. 906), form argentic cyanides and amercyanides, and, of these, the salts have been made of the elements cerium, lanthanum, and neodymium. It has not been found possible to produce analogous salts of the other trivalent metals.

**MINERALOGICAL CHEMISTRY.** A better knowledge of the composition of the solid crust of the earth's surface is of great value. It gives information as to how mineral combinations have been formed, and includes the discovery of new minerals.

The rare earth elements which, according to C. E. St. John and C. E. Moore (*Isotaphys Jour*, vol 68, p. 93), are probably present in the sun, include lanthanum, cerium, neodymium, praseodymium, samarium, europium, gadolinium, dysprosium, erbium, and ytterbium, probably in the ionized state. Unusually low values described by Klockmann was found by P. Rindfleisch to be a new mineral with the composition  $Cu_2Se$  and to which the name Klockmannite was most appropriately given. A new mineral was reported from the bauxite deposits of the Tikhvin district by J. M. Anshelov and N. J. Vlodavetz (*Mem Soc Rus*

*Min*, vol 56, p. 53), which has a composition corresponding to the formula  $2SrO, 3Al_2O_3, P_2O_5, 7H_2O$  and to which the name Tikhvinit was given. C. E. Tilley (*Min Mag*, vol 22, p. 77) described a new aluminum orthosilicate with the formula  $Ca_2SiO_4$  from Seawt Hill, near Larne in Ireland, which he calls Larneite. Renardite was a new uranium mineral from Chinkolobwe (*Bull Soc Franc Min*, vol 1, p. 374) which according to A. Schoep has a composition corresponding to the formula  $PbO, 4UO_2, P_2O_5, 9H_2O$ . Rimann (*Bol Acad Sci Cienc*, vol 31, p. 5) reports a new red mineral with a glassy lustre from Argentium which has the composition  $4MO_2, 3MO$ , which he names Bodenbenderite.

**ORGANIC CHEMISTRY.** The chemistry of the carbon compounds continues to attract a large number of students for its possibilities are very great. From its study will come in time the synthetic compounds such as artificial rubber, that will revolutionize commercial industries.

E. Kleuk reported (*Zeit Physiol Chem*, vol 179, p. 312) that treatment of ceribionic acid with hydroiodic acid dissolved in acetic acid gave lignoceric acid thus confirming the constitution of ceribionic acid as an alpha hydroxylignoceric acid. The probable derivation of the lipins from the sugar was also discussed by the author in his paper referred to. According to W. Fuchs (*Ber*, vol 61, p. 2599) diphenylene oxide is converted into diphenyl by passage over calcium hydride at  $450^\circ C$  in an atmosphere of hydrogen. According to E. Bahl (*Biochem Zeit*, vol 204, p. 474) cholesterol gives a yellowish coloration with a solution of benzidine in glacial acetic acid and an intensely red coloration with a faintly pink solution of resaniline in chloroform. Both tests are parallel to those of Salkowski and Liebermann.

A new combination of sulphhemoglobin is obtained by A. D. Volta (*Arch Ital Biol*, vol 77, p. 6) who found that by treatment of blood with freshly prepared ammonium sulphide solution saturated with hydrocyanic acid, hydrochloric acid, or sulphite affords an olive-green coloration due to chlorohemoglobin. Additions of pyridine changes the green color to brick red and the phenochromogen spectrum may then be observed. The author recorded his spectrophotographic measurements. According to W. S. Sadikov (*Biochem Zeit*, vol 25, p. 360) hydrolysis of proteins by ammonium carbonate under pressure at  $150-180^\circ C$  gives after one to six hours principally peptones, and only after 24 hours are crystalline products obtainable. Caseinogen gave a peptone suitable for bacteriological purposes and on further hydrolysis a number of products which were crystallizable or separable by precipitation. Leucine was obtained and nine other preparations for which empirical formulas are suggested.

The synthesis of sucrose was accomplished by G. Zemlin and A. Gereis (*Ber*, vol 62, p. 510) as follows. The condensation of tetraacetyl gamma fructose with tetraacetyl glucose in the presence of phosphoric oxide causes the production of 10-15 per cent of a disaccharide from which octa-acetylglucose could not be obtained crystalline. The acetylated sucrose does not crystallize when seeded with mixtures of 50 per cent of it with 50 per cent of tetraacetyl gamma fructose or 50 per cent of tetraacetyl glucose. The conditions for the synthesis of sucrose, according to these authors, appear particularly suitable. According to B. Rutovskii and A. Koroley

(*Chem Zentr*, vol 2, p 2353), the electrolyte reduction of salicylic acid afforded salicylaldehyde in a yield of 33 per cent of the theoretical. If magnesium butyrate is added in order to avoid sparking and explosion of the benzene, the chief product (45 per cent) is saligenin. C. A. Rojahn and F. Struffmann (*Pharm Zentr*, vol 70, p 277) find that while hydrostome and papaverine separately give poorly characterized color reactions with alkaloid reagents, mixtures of the two alkaloids give intense colorations, and this fact may be utilized in their identification. For the detection and determination of methylpentose, T. Fukui (*Bull. Feim.*, Tokyo, No 100, p 106) reports that the distillate obtained from methylpentose and hydrochloric acid gives a violet-red coloration with vanillin in 0.5 per cent sulphuric acid. Soluble differences of the phloroglucides of furfuraldehyde, methylfurfuraldehyde and hydroxymethylfurfuraldehyde are applied to their separation.

A. Pictet and H. Vogel (*Ber.*, vol 60, p 1418) describe in full their preparation of tetra-acetyl-gamma-fructose, the condensation of the tetra-acetates of glucose and gamma fructose, and then the isolation and hydrolysis of sucrose octaacetate. Anserine, a new constituent of bird-muscle tissue was obtained by Di Ackermann, O. Timme and K. Poller (*Z. Physiol. Chem.*, vol 183, p 1) by extraction of goose flesh with water and treatment of the extract with mercuric sulphate and sulphuric acid. The new substance is precipitated from solution by alkaloidal reagents and gives the ninhydrin reaction. Anserine is not present in the liver, stomach, or heart.

A. E. Tschischbabin discussed (*Journ. Russ. Phys. Chem. Soc.*, vol 61, p 607) the theoretical possibility of the existence of cis-trans-isomerism of oxalic acid and certain results obtained by previous writers are considered in the light of this possibility. According to C. S. Hudson and E. P. Peasn (*Science*, vol 69, p 278) crystals of turanose from a syrup of hydrolyzed melizitose after keeping for several years have been successfully used to seed fresh syrups and obtain rapid crystallization. The crystals are moderately soluble in methyl alcohol, from which they can be easily recrystallized in prisms with a melting point of 177° C. A study on the denaturation of proteins by T. Tadokora and his assistants showed (*Journ. Fac. Sci.*, Hokkaido, vol 25, p 117) that rice ovocin was denatured in solution by boiling and by freezing, soy-bean glycin by boiling, freezing, superheated steam, gasoline or benzene, soy beans by heating, boiling, freezing, and sinking in gasoline, salmon proteins by cooling, freezing, salting, and smoking. The resulting chemical and optical changes also are reported on by these chemists. According to W. L. O. Whaley (*Planter and Sugar Mfg.*, vol 81, p 321) alcohol may be satisfactorily determined by measurement, with the Juvet ebulliometer, of the lowering of the boiling point of its aqueous solution.

**PHYSICAL CHEMISTRY.** The action of the physical forces on chemical substances is an important branch of science. In 1929 the world celebrated the fiftieth anniversary of the wonderful results of the action of electricity on a carbon film, resulting in the electric light.

The red line in the spectrum of the aurora borealis, long supposed to be an unclassified oxygen line was reexamined by J. Kaplan (*Proc. Nat. Acad. Sci.*, vol 14, p 892) and found to be

a band belonging to the first positive group of nitrogen. The green line is probably the only oxygen line in the auroral spectrum. Observations on the furnace spectrum of beryllium were made by R. F. Paton and G. M. Rassweiler (*Physical Rev.*, vol 33, p 16) from 2150 to 7000 Å and up to 2500° Abs., in both absorption and emission, using a specially designed 2.1 liter, saturation vacuum furnace. Their results confirmed that the beryllium line 2318.62 Å is the first line of the principal series of singlets for the neutral atom. The diffuse and sharp series of singlets of the element were discovered and tabulated.

A Japanese scientist, M. Miyazaki (*Japan Journ. Phys.*, vol 5, p 67) reported that the streamers emanating from the anode and cathode of a spark were examined spectrographically and found to consist of positively and negatively charged particles, respectively. Then velocity and luminosity also were measured. Additional records on the creeping of crystals are reported by H. Erlenmeyer (*Helv. Chim. Acta*, vol 12, p 264). He found that the addition of 1 per cent of glycerol almost entirely prevents creeping in a saturated solution of potassium chloride, also sucrose and thymol have a similar effect. This is not due to a decrease in evaporation. Experiments also are described by this author relating to the factors which influence the height to which crystals will creep up a glass rod placed in a saturated solution of a salt.

According to C. E. S. Phillips (*Nature*, vol 123, p 681), when a cell prepared by condensing the vapor of heated selenium on a gold grid, was exposed to cathode rays, a rapid diminution of resistance, which could be widely varied by deviating the rays with a magnet took place. This effect is not attributed to the production of X-rays in the selenium. J. de Smedt, W. H. Keesom, and H. H. Mooy (*Proc. Acad. Wet.*, Amsterdam, vol 32, p 745) found that, when carefully purified nitrogen was submitted at the temperature of liquid hydrogen to the  $K\alpha$  radiations from copper and the results photographed, a critical analysis of the photographs obtained seemed to indicate a quadratic crystal structure. According to L. Farkas, P. Goldfinger, and F. Haber (*Naturwiss.*, vol 17, p 278), their earlier work on the suggested chain mechanism for the ignition of electrolytic gas has been confirmed and extended. Atomic oxygen or atomic hydrogen present in minute amount renders electrolytic gas immediately explosive. Further control experiments strengthen the case in favor of the chain mechanism. See CHEMISTRY, INDUSTRIAL, PHYSICS.

**CHEMISTRY, INDUSTRIAL.** The growth of the application of chemistry to the industrial arts has continued to increase. As evidence of this fact may be cited the statement by Dr A. D. Little, president of the Society of Chemical Industry, that "the incessant questioning of nature by the experimenter to create wealth and jobs" was scientific research so essential to the progress of industry.

In February, the American Chemical Society announced the awards from the Frash bequest to be devoted to research in agricultural chemistry as follows: the Boyce Thompson Institute, Yonkers, N. Y., \$20,000, the University of Missouri, \$12,000, and the University of Wisconsin, \$8000 annually for five years.

**AMERICAN CHEMICAL SOCIETY.** Two meetings,

as usual, were held during the year. The first, in Columbus, Ohio, from April 20 to May 3, at which 1765 persons registered and at which 375 papers were read before 16 divisions. The subject of the presidential address by Dr. Irving Langmuir was "Modern Concepts on Physics and Their Relation to Chemistry." The membership of the Society has reached the high record of 17,273. President-elect Samuel W. Parr tendered his resignation and Prof. William McPherson of Ohio State University was chosen in his place by the Council.

At the Columbus meeting, various interesting papers were presented. These included one by James F. Norris, of the Massachusetts Institute of Technology, on a new alcoholic substance which is a product of petroleum and one of the first results obtained in experiments that aim at using oil wastes as a raw material to make useful things in addition to lubricants and gasoline. Chemists have produced this alcohol under the name of isopropyl. They are now studying it actively in order to extend its industrial uses and to determine whether it may be substituted for grain or ethyl alcohol. It is unlike other alcohols, as its physiological effect on humans is different. It produces no exhilaration but has a deadening effect. If it can be developed sufficiently, it may help to prevent the rectifying of denatured alcohol. We are at the beginning of the use of former wastes of petroleum as raw material. Chemists are experimenting in taking rather cheap substances from these wastes and converting them into articles of value, thereby increasing wealth.

One day of the meeting was given over to a symposium on agriculture and chemistry, described as the largest two industries of the United States. That chemistry, rather than congressional measures, may be the salvation of the farmer seeking relief, was the contention of Louis J. Taber, master of the National Grange, who argued that "farm relief that will endure can come to agriculture through proper research directed by American chemists in discovering new uses for food products as the raw materials for industry." When we can think of farm products as food for machines, as well as for man and beast, we shall find burdensome surpluses vanishing.

Maj. T. P. Walker of the Commercial Solvents Company, Terre Haute, Ind., in discussing M. Taber's address, claimed that corn and cotton are the only crops of major importance to the chemist at present. Other farm products, however, may acquire interest for the chemist as new means of utilizing them are discovered. The corn crops in Illinois, which once went into the making of whisky, are now being converted into lacquer. The production of acetone, and butyl and ethyl alcohols consumes nearly 10,000,000 bushels of corn annually, which is one-quarter of the amount formerly used in the manufacture of spirituous liquors.

More than 50 chemical products are derived from the corn kernel. They include such things as table oil, soap, glycerin, rubber substitutes, fertilizer, starch, corn sirup, tanner's sugar, and vegetable glue. Cottonseed also yields quite a number, including refined oils, stearin, soap, nitroglycerin, roofing paint, writing paper, nitrocellulose, smokeless powder, lacquers, artificial leather, celluloid, rayon, photographic films, sausage casings, toilet ware, furfural, carbohydrates,

and potash. The cotton plant itself is used in bleaching, dyeing, printing, waterproofing, and mercerizing. Major Walker referred to the manufacture of insulating board from bagasse, the refuse of sugar cane after it had been crushed in the mill to extract the juice, and also to the production of ethyl alcohol from "blackstrap" molasses.

Of interest in this connection is the prospect of an increased yield in the beet-sugar industry. A process has been worked out by chemists at Ohio State University, with the aim of enabling sugar farmers to overcome bad crop years. On an average, two out of every three years bring poor yields for the beet growers, due to a gum caused by insoluble matter in the juice of the beets, which then produce little sugar, but plenty of molasses. The molasses is salable, but at a lower price than sugar. Lime sulphitation was employed to overcome similar gum in sugar-cane juice, but the use of lime and sulphur dioxide to eliminate the gum in beet-sugar refining was not successful, owing to the difficulty of ascertaining the amount of gum present and how much lime and sulphur to use. Ethyl alcohol and hydrochloric acid are used in the perfected method for control of the gum in sugar-beet juice, and it is claimed the amount of gum is now accurately and quickly determined.

Economic relations between the chemist and the farmer also were discussed by Charles M. McDowell, of the Armour Fertilizer Works of Chicago, who urged that run-down soil be continually replenished with chemical nutriment. In wide areas of land, there are deficiencies of nitrogen, phosphorus, potassium, calcium, iodine, sulphur, molybdenum, and manganese. The effect of a total lack of any one of these is often insidious and far-reaching. If the crops are deficient, there may result underweight and weaker livestock and poultry on the farm, milk that is lacking in vital minerals and vitamins, and consequently, ill health and deficiency diseases in the city.

The use of talking motion pictures as a medium of instruction in certain courses in universities and colleges was suggested. Sound pictures, it was predicted, especially in laboratory demonstrations introduced as part of lectures, will reestablish a more intimate bond between instructor and student, enabling the student by "close ups" to follow every phase of an experiment. Several times, when changes were taking place in the substances under experimentation and close scrutiny was essential, the lecturer on the screen invited the audience to look over his shoulder. A "close-up" flashed on the screen and the audience found itself almost with its collective nose in the test tray. The adaptation of the "talkies" for the use of the modern large classrooms, it was predicted, would give a new reality to the oft-quoted definition of education. "A student on one end of the log and Mark Hopkins on the other." Plans were already under way to make projection machines at nominal cost for institutions of learning.

The second meeting was held in Minneapolis, Minn., during September 9-13, at which 1175 persons registered and at which 325 papers were presented before 20 sections. Among the papers presented at this meeting, one by K. F. Bonhoeffer was conspicuous. In a demonstration, from a cylinder of ordinary liquefied hydrogen provided by the University of Minnesota, he drew off some of the liquid to be used as an outside bath

around a glass tube filled with ordinary gas charcoal. The liquid gas bubbled and froze and the charcoal rapidly approached the ultimate cold of the physicists. When everything was cold enough, Mr. Bonhoeffer passed some ordinary hydrogen from the cylinder through the supercooled tube of charcoal and it came out at the other end as parahydrogen. By tests, he showed how it differed from the ordinary hydrogen from which it had been divided, showing it to be a mixture of two kinds of hydrogen, of different melting and boiling points, different heat conductivities, and different spectra.

Dr. Irving Langmuir, president of the American Chemical Society, and himself famous for his researches in molecular and atomic structure said: "The division of the hydrogen mixture today would have a compelling effect in spreading the new wave mechanics among chemists who are now seeking to control chemical reactions by understanding their mechanism." Dr. H. S. Taylor characterized it as "the greatest chemical achievement of 1929." Francis P. Garvin sent a paper entitled, "Random Thoughts of a Lay Chemist," in which he said "I am convinced that, in case of a modern war between great Powers, it would be foolish and useless for any battleship or cruiser to leave its dock or an army to take the field. Should not the terrible powers of chemistry, as we know them, and its war messengers, the airplane, on sea and on land, strengthen the effort to safeguard the peace of the world by treaties and by agreements? Should not the dread possibilities of chemistry rule out the politicians and give to research in chemistry, in medicine, and in the other sciences, a fraction of the huge cost of navies and armies, created to destroy life and property? The Chemical Foundation stands ready to bear all the expenses of any commission the President may care to appoint to inquire into the vast possibilities of chemistry as an agent of peace, outlawing war by its ferocious, advancing health and prosperity by its humane discoveries."

In his presidential address, Dr. Irving Langmuir gave an inkling of the things of which chemistry dreams for the future. He asserted that "with Einstein's theory and other purely mathematical concepts of the nature of time and space, it is possible to conceive that in a distant future different forms of light than those now known may evolve." He asked whether it may be possible that "eventually time itself will be different, its arrow pointing in other directions. The idea is of time that grows younger instead of older. Such speculations may seem fantastic. It is, I believe, of the most importance for the chemists and the physicists to evolve fundamentally sound conceptions of such things as time and entropy. It seems that there has never been a time when we can predict with such certainty rapid progress in fundamental chemistry."

According to Gustav Egloff, the motor car's rôle is not as a creator of demand, but as mother to useful chemicals such as that which has come into existence recently from the new process of making gasoline. In the formerly waste gases from gasoline cracking, chemists have found substances used for the manufacture of various articles that bear no resemblance to gas or gasoline, such as cosmetics and pharmaceuticals, lampblack and hydrogen, some of them already on the market. Ethylene, one of the gasoline

products, already is made into anesthetics, is used to ripen fruit and vegetables, and to prepare war gases. Chemists are beginning to get a little "butadiene," which resembles rubber and can be manufactured into rubber-like substances. Many fuel-gas users are getting a better grade, made so by being mixed with some of the product of the former waste from cracked gasoline.

There is enough refuse material to make 300,000,000 gallons yearly of grain alcohol, three times the amount consumed commercially in the United States. Predictions that stale bread will return to the home in the guise of alcohol, pastes, etc., was made by C. G. Harrel, who asserted that the hundreds of thousands of tons of dry or stale bread yearly burned in furnaces or sent to city dumps, could be transformed into those materials, though this was not being done as yet. The bakers have been in fear of public opinion. Economic necessity, however, will open this field to the chemist and the bakery will then keep pace with many other industries.

That large and beautiful diamonds can be made by man was claimed by Prof. J. W. Hershey. He told how he melted iron filings and sugar in graphite crucibles, heated these in an electric furnace at a temperature of nearly 5000° F. and, when white hot, plunged them into ice-cold brine, the theory being that the immense pressure created by fast cooling would turn the sugar into diamonds. Next, he dissolved the iron balls with various acids. After a week, everything except some dust, the sugar-carbon product, was dissolved. Some of it proved to be graphite, another form of carbon when examined with the microscope. Hundreds of microscopic diamond particles and some larger diamonds so far had been produced at McPherson College. Professor Hershey declared his belief that "the artificial construction of diamonds, from the scientific point of view, is no longer an unattainable goal."

Professor S. C. Lind solved a problem that has been bothering chemists in many branches of manufacturing. He had produced phosgene, one of the poison gases used during the World War, merely by turning light upon carbon monoxide and chlorine, which caused the two gases to combine into phosgene. He substituted radium rays for the light and again obtained phosgene. Chemists have been in doubt as to how the change into phosgene took place. The method used by Dr. Lind was quite simple. The point of importance to commercial chemists is that radium substituted for light produced the same result.

The closing session of the Chemical Society's meeting was devoted to a consideration of how best to educate the public to an understanding of chemistry and its function in national defense. It resulted in the adoption of a programme of popular study courses which open with the romance of chemistry, points out the impossibility of naming any three things of importance with which chemistry is not involved; explains that the human body is a chemical factory, what makes some water hard and other water soft, how soap is made, the use of nitrogen and potassium for fertilizer and the importance of sufficient sources of supply, and compares the chemical elements in cotton with those in silk. The concluding sections of the course deal with such titles as "Why Do Large Manufacturers of Explosives Produce so Wide a Variety of Peace Products?", "Have Explosives Been a Blessing or a Curse to

Man", "Classes of Explosives and Uses of Values of Each in War and Peace", and "Which is the Real Goal, 'Peace Regardless of Security' or 'Lasting Peace in Permanent Security'?" The administration of this programme with the organization of lecture courses to make it effective throughout the country, was accepted by the Bureau of Women's Clubs of the University of Kansas, and it is expected that many similar organizations will make it a part of the programmes for the coming year.

**SOCIETY OF CHEMICAL INDUSTRY.** The 48th annual meeting of this Society was held in Manchester, England, during July 8-13, with President A. D. Little in the chair. The council reported that the membership had declined from 4668 to 4550, a loss of 118 members. The gold medal of the society was awarded to Sir Richard Trellfall for his services during the World War in devising various appliances for the Ministry of Munitions, especially those connected with the use of phosphorus as a smoke-producing agent, and later, as chairman of the Chemical Research Board, he delivered an address, "The Electrolysis of Molten Zinc Chloride." The subject of President Little's retiring address was "Science and Labor." The honorary degree of D. Sc. was conferred by the University of Manchester on past presidents Finnis H. Carr and Arthur D. Little. The new officers elected were Dr. Herbert Levinstein as president and H. J. Pooley as secretary. Birmingham, England, was selected as the meeting place in 1930.

**EXPOSITIONS OF CHEMICAL INDUSTRIES.** The 12th occurrence of this event took place in the Grand Central Palace, New York City, during May 6-11. There were over 400 exhibits, many of which showed the advances made by science during the year. Every State in the Union, and Canada, Mexico, the West Indies, and many European nations were represented. Two educational courses were given daily under the direction of Prof. W. T. Read of Texas Technological College, one for elementary students and the other for advanced chemical engineers, teachers, and experts. Among the exhibits were concrete made of peanut shells, motion picture film which does not burn, houses built of corn, and plants whose growth may be rushed by feeding them poison. Another display was of wire cloth, so finely woven that one inch contains more openings than there are hairs on the human head. How new discoveries in chemical engineering are applicable to radio, television, and talking pictures was described. The sixth annual chemical industries dinner was held at the Hotel Roosevelt on Thursday, May 9, under the auspices of the Salesmen's Association of the American Chemical Industry.

**MEMBERS.** The Perkin Medal of the Society of Chemical Industry was awarded on January 4 to Eugene C. Sullivan for his chemical studies that have improved the quality of American glass. The Nichols Medal of the American Chemical Society was awarded on March 4 to William L. Evans of the Ohio State University for his contributions to the chemistry of the carbonylates. The medal of the American Institute of Chemistry was awarded on May 4 to Mr. and Mrs. Francis P. Garvin for noteworthy and outstanding services to the science, especially in consideration of their financial support of the Chemical Foundation. In appreciation of a long career of achievement, Charles E. Munroe, chief ex-

plorative chemist of the United States Bureau of Mines, was on June 16, his eightieth birthday, presented with a bronze medal bearing his portrait, the outlines of which were literally blown into the medal by means of the "Munroe effect." The Willard Gibbs Medal of the Chicago section of the American Chemical Society was awarded May 24 to Claude S. Hudson for his researches in the field of sugars. The medal of the Society of Chemical Industry was awarded on July 11 to Sir Richard Threlfall for his work on explosives during the World War. The Priestly Medal, the highest honor of the American Chemical Society, was conferred on Francis P. Garvin "for his distinguished services in chemistry," on September 11. The Grasselli Medal was awarded on November 8 to Prof. Bradley Stoughton for his paper, "Light Structural Alloys," and on December 13, the Chandler Medal of Columbia University was awarded to Dr. Irving Langmuir, president of the American Chemical Society and associate director of the research laboratory of the General Electric Company.

**CADMIUM.** According to a report on the uses of this metal, by Paul M. Tyler issued by the U. S. Bureau of Mines, cadmium formerly entered largely into dental alloys as an amalgam 26 per cent cadmium and 74 per cent mercury, but this discolors the denture more than other mixtures and has been largely discontinued.

Cheché metal for stereotype plates may be made of about 22.5 per cent cadmium, 50 per cent lead, and 27.5 per cent tin, a mixture superior to the corresponding chebe metal containing bismuth. An important use of the metal is in copper telephone and trolley wires. In proportions of 0.5 to 1.2 per cent, cadmium raises the annealing temperatures and adds materially to the strength and wearing qualities of copper without greatly reducing the conductivity. Some quantities of cadmium are used to improve the properties of both plated and sterling silverware. In the jewelry trade, cadmium is employed for producing green gold. A recent use for cadmium is in rustproofing steel, particularly nuts, bolts, sundry small parts for automobiles, and various light hardware, including locks, refrigerator trimmings, and certain wire products. Cadmium has been employed in the form of wire for coating or metal spraying, plaster casts, statuary and other objects.

Alloys containing cadmium are used in non-rusting hand-springs for watches and clocks. For the manufacture of electric-light filaments one of the earlier processes employed cadmium. An amalgam which is 42 per cent cadmium, 53 per cent mercury, and 5 per cent bismuth can be impregnated with tungsten metal powder and then extruded through dies to produce a raw filament which is later heated to a high temperature to drive off the volatile metals. Five per cent of cadmium is sometimes added to aluminum powder to improve the color and lustre and to make it more resistant to atmospheric influences.

Cadmium has been recommended for use in electric storage batteries. A battery having cadmium plates can be discharged completely and allowed to remain discharged indefinitely, whereas such abuse causes serious damage to ordinary lead batteries. The monochromatic red light for scientific investigation in physical laboratories is produced by means of cadmium. In the quartz-cadmium vapor lamp developed by the U. S.

Bureau of Standards, the cadmium is alloyed with a very small fraction of 1 per cent of gallium, giving a long-lived lamp that does not become clouded by adhesion of cadmium vapor to the walls.

**CHROMIUM** From a report on the uses of chromium issued by the U S Bureau of Mines, the following is taken: Chromium steels that are approximately 1 per cent chromium and 1 per cent carbon are utilized in the manufacture of shoes and dies, for use in stamp mills and burglar-proof safes. The expanding market for stainless steel and iron is playing its part in the increasing consumption of chromium in the manufacture of steel. In the manufacturing of chromium steels and irons, the chromium is added in the form of ferrochrome, which is made from chromite in the electric furnace. In this process, the bath tends to take up much carbon, and as carbon is considered undesirable, the quality and price are in inverse proportion to the carbon content.

The potential uses of chromium seem to open a field so useful to humanity that attention is called to the consumption of chromite as a refractory. As chromium may be used for the preservation of many metals, it becomes evident that any of the uses which rapidly dissipate chromium should be eliminated. The demand of the paper-pulp mills for chromite brick has lately developed an expanding market. These bricks fulfill a need in the lining of the kilns used in the sulphite process for drying pulp, as they resist corrosion caused by the liberated gases in the kiln.

**POTASSIUM** A consent decree, signed Feb 27, 1929, by Federal Judge Bondy, disposed of the suit of the Government against the Deutsches Kaliyndikat (Gesellschaft) and the Société Commerciale des Potasses d'Alsace which were charged with violation of the anti-trust laws in the importation and sale of potash. The suit, begun in April, 1927, under instructions from the U S Department of Justice, alleged that a group of German and French producers of potash were in New York City to complete arrangements with American distributing agencies for the creation of a monopoly. It also was alleged that the foreign producers had reached an agreement effective May 1, 1927, for the division of the United States business, but that the defendants had been dividing the potash trade since August, 1924.

Government agents reported that 1,000,000 tons of potash worth \$50,000,000 were imported annually, that 90 per cent of it was sent here by the defendants, the German producers providing 70 per cent of this and the French, the remainder. This decree binds the principal defendants and their agents to observe the anti-trust laws and enjoins them from fixing resale prices or unfair discrimination among purchasers. Jurisdiction is retained by the court to enforce the decree and to correct any inadequacies or inappropriate provisions as the business develops.

The passage by Congress of a bill makes possible further investigations into the potash resources of the United States. Previous investigations were limited to the exploration of potash deposits in Texas and New Mexico, which geological data indicated as being present but which had not been proven. The U S Geological Survey located the most promising sections for drilling. Following this, the Bureau of Mines carried on a

comprehensive diamond-drilling campaign and laboratory study of the drill cores. By the provisions of the new bill, investigations are authorized to cover other potash minerals, such as the leucites and aluminates, greensands, and other potash ores, also, that investigations shall be conducted by the Bureau of Mines and the Department of Commerce, and the Bureau of Chemistry and Soils of the Department of Agriculture.

**HELIUM** A press notice published on May 30, announced that a rich deposit of helium gas had been discovered in Utah near the government's reserve. The find was hailed as of much importance in the development of "air-craft in the United States. The contents in the Utah natural gas, it was estimated, might reduce the cost to one-third of the present  $3\frac{1}{2}$  cents a cubic foot. In July, it was announced that new deposits of helium gas had been found in Colorado that would provide sufficient lifting gas for inflation and operation of all United States airships for the next 20 years. The new field was said to be the richest helium deposit yet found, the gas having a helium content of 7.07 per cent, the best previous content being 3.6 per cent.

In Canada, the greatest source of supply comes from the Bow Island district of Alberta, near Calgary, where it is estimated some 12,000,000 feet of helium are lost annually. In 1919 a plant was erected at Calgary for extraction and from which vast quantities of helium were exported to France and utilized in balloons and lighter-than-air war craft. It was officially stated that, if this gas had been utilized earlier, it would have had a marked effect upon the operation of craft of this nature and resulted in a considerable saving of life. The termination of the War brought an end to the demand, the British Government's subsidies were withdrawn, and production ceased.

The new government plant at Amarillo, Tex., announced in June the sending of a tank car filled with about 200,000 cubic feet of helium to Langley Field, Va. The helium is extracted from natural gas having a helium content of 1½ per cent produced from the Chilside structure lying northwest of Amarillo. Gas from 20,000 acres of land is available to the plant. The helium-bearing natural gas is transported from the wells to the plant, by the natural pressure of the wells, through a welded steel pipe line 11 miles long. In the plant, the gas is cooled to a temperature so low that all of the constituents except helium are reduced to liquids. This temperature is approximately that of liquid air and is lower than 300° F below zero. The helium is drawn off as a gas and the liquids are returned to the gaseous state by allowing their temperature to return to that of the atmosphere. A part of the gas resulting from the evaporation of the liquid is used as fuel for generating power to operate the plant and the remainder is discharged into a pipe line which carries it to Amarillo, where it is used as domestic and industrial fuel. The process of extracting helium is a continuous one involving pressures as high as 2500 pounds to the square inch.

**STEEL** The Westinghouse Electric & Manufacturing Co announced the manufacture of steel with a skin which is produced through a process called nitriding, by placing the steel in a box of ammonia gas at 1000° F. This forms a thin

skin extremely hard, quite tough, and rustproof. It is claimed that, by this process, bearings may be made that seem never to wear and which may run safely though heat to redness. A new mechanism to start and stop electric motors was recently built and tested "on" and "off," until after some 22,000,000 or more operations, everything wore out except some bushings and pins of nitrided steel, still as good as new. In the making of small machine parts by die casting, in which molten metal is flowed into a steel mold, the new material withstood 2000 operations, though former steels perished after 100. Nitrided tools do not rust when left out in the weather.

**NEW ALLOYS** A new metallic composition consisting of tungsten, carbon, and cobalt, originating with the Krupp Steel Works in Germany and sold there under the name of Izett, has appeared in the United States under the name of Widia. After a thorough test by the General Electric Company at its plant in Bridgeport, Conn., it has been found serviceable as a cutting metal, cutting through steel at a rate of 230 feet a minute, and through cast iron at a rate of 600 feet a minute. Notwithstanding its high cost of \$500 a ton, it promises to supplant other cutting metals. Its properties are described as follows: Its strength, hardness, toughness, and chemical stability, as well as its ability to take and keep a "fine" characterize it as a material of "possibilities."

The performance of carboloy on the lathe and in the shop actually exceeds the predictions which might be made from a knowledge of its properties. Glass was quite easy to machine or to cut with screw threads and it was found that hard porcelain insulators could be machined on a shaper. Mycalex is an insulating material of excellent properties and there is a considerable demand for it in the electrical industry. Ordinary tool materials are worn away on mycalex so quickly that it would be difficult to give quantitative data on their performance. Carholoy tools, on the other hand, are capable of machining mycalex commercially, and we have had tools cutting over 1000 feet linearly before losing their edge. Materials like bakelite and hard rubber are very abrasive when machined at high speeds. Carboloy tools keep their edge very well on hard rubber. The metal is sold in the United States under the trade name of "carboloy."

The announcement was made in September that a new alloy that gains tensile strength as it grows hotter—something entirely different from anything heretofore known—has been perfected by Dr. Erwin F. Lowry of the research department of the Westinghouse Electric & Manufacturing Co. The alloy consists of a combination of cobalt and nickel from which it derives its name, konel, and ferrotitanium. Konel has been subjected to exhaustive tests which revealed many valuable qualities. Almost without exception, metals grow softer and lose tensile strength as they undergo high heat, but konel, heated to 800° C, which is approximately 1100° F, will withstand a pressure of 60,000 pounds to the square inch. Even further tests show konel is tougher and harder when heated to 1800° F. It is used in the manufacturing of the filament in high-class radio tubes, replacing iridium, long believed the only metal fitted for that purpose; also, it should be highly efficient where metal is exposed to great

heat generated by friction or internal combustion.

**MOTOR FUEL.** Early in 1929 the American Chemical Society issued a summary of the advances made during 1928 in motor fuels, most of which had already appeared in various issues of the *YEAR BOOK*. In addition to gasoline and its many mixtures, there are motor fuels derived as by-products from coal, which are now commercial products in Germany, produced by the direct hydrogenation of coal, yielding a motor fuel that resembles, but is cheaper than, gasoline. More recently, chemists have turned their attention to other carbonaceous materials as a source, and in June, 1929, announcement was made of an anti-knock motor fuel obtained from tar of the Douglas fir. The development of a practical and economic means of converting wood waste into motor fuels provides a source of motor fuels for the future which is under the direct control of man. The great storehouse of potential motor fuel from petroleum, coal, and oil shales are heritages from past ages, while wood tars and other vegetables are producible under controlled conditions.

Approximately 24 per cent of the standing tree is converted into useful products, while 76 per cent is wasted. As an example of the possibilities of the utilization of this waste, from an average annual yield of 7,500,000,000 board feet of Douglas fir, the equivalent of 2,500,000 cords, or 4,200,000 tons, is available for destructive distillation, yielding the following products: turpentine and light oils, 8,500,000 gallons; tar, 70,000,000 gallons; wood alcohol, 9,780,000 gallons; calcium acetate 187,500,000 pounds; charcoal, 2,440,000,000 pounds; and a large yield of gas for fuel. The 70,000,000 gallons of tar will produce by cracking, it is claimed, 23,300,000 gallons of motor fuel equal to benzene in anti-knock properties.

According to tests made by the Pittsburgh station of the Bureau of Mines, ethyl gasoline used as an automobile engine fuel does not materially increase the percentage of carbon monoxide in exhaust gases. As to the effect of ethyl gasoline on health and safety, the amounts of carbon monoxide produced by the engine, under any comparable operating condition, were found to be the same for ethyl gasoline and straight gasoline.

**GLASS.** A special new glass is reported from Japan. It is composed of two sheets of glass with a thin sheet of celluloid between. It is patented and approved for use in the Japanese Army and Navy. At present, this glass is produced in only one size, namely, 5 millimeters thick, 24 inches wide, and 48 inches long. It is sold at 4 yen per square foot, factory packing and shipping charges being extra. Only 200 pieces of the above dimensions are produced each month.

**SUGAR.** The announcement of the discovery of a new sugar was made in February, 1929, by the U. S. Bureau of Standards, where experiments on inulin, a starch-like substance found in dahlias, chicory, artichokes, and other plants, have yielded a new product called "difructose anhydride." The process is as follows: By treatment with acid, inulin is changed to the very sweet sugar, fructose or levulose. Experiment showed, however, that not more than 92 per cent of the expected amount of fructose was obtained, and a study of the remaining 8 per cent revealed the presence of a new sugar which was composed of two molecules combined in such close union

that the acid was unable to convert it to fructose.

**EXPLOSIVE** Amatol is the name of a substance experimented with as a high explosive at the Pettawawa Military Camp in Canada. It was said that amatol was produced by British chemical engineers and was being used in some of the new guns with which artillery divisions of the British Army have been equipped. Experiments were being carried on by the military authorities of all the dominions of the British Empire with amatol, and it was said that if the cost of manufacture is no greater than that of cordite, the new explosive eventually would be adopted as the charge of the quick-firing guns. One of the features of the new explosive is that there is no charred residue of the envelope containing the charge. In cartridges of quick-firing guns charged with cordite, the charge is contained in a cotton envelope and, on opening the breech immediately after firing, the remains of this envelope are still in the cylinder, charred and smoldering, but when amatol is used the whole content of the cartridge case is immediately consumed.

**PURIFIED WATER** A press dispatch from Berlin, Germany, in February, 1929, claimed that sterilizing water for drinking purposes could be easily accomplished by using  $1\frac{1}{2}$  grains of silver prepared by the Krause method. Dr. Rudolf Degkwitz, professor of hygiene at Greifswald University, made a thorough test of the process and found that, within less than an hour, he succeeded in completely sterilizing a cubic centimeter of water which contained a million germs. The new method is said to work independently of temperature, can be applied to any quantity of water, and needs no supervising.

**SYNTHETIC RUBBER** Late in October, 1929, a press dispatch from Geneva, Switzerland, announced that E. Kleiber, of Basel, after many years of experiment, had discovered a process for producing cheap synthetic rubber on a large scale. Kleiber asserts that it possesses all the qualities of rubber, but has more elasticity, its basis being natural mineral oils. He also claims that, owing to the cheapness and durability of his product, streets and roads may be covered in the future with synthetic rubber and that it also may be used in many other fields. A German chemist from Frankfurt already had produced synthetic rubber costing \$7.50 a kilogram which is 10 times the price of ordinary rubber, but Kleiber's product costs only 8 cents a kilogram.

**COMMERCIAL CONSIDERATIONS** At a meeting of the American Institute of Chemists held in New York City on May 4, 1929, Francis P. Garvin again expressed the opinion that German dyestuff makers had launched a war to destroy American post-war progress in dye manufacture and other chemical processes, thus endeavoring to recapture the market. He said the German Interessen Gemeinschaft was brought into the United States by a group of American commission-bankers who had taken \$30,000,000 out of the funds in their custody, or under their control, to assist the I. G., under the guise of bonds, in the new war to destroy United States chemical progress. Mr. Garvin gave this succinct admonition and warning: "Always and forever remember the stake for which the Germans strove before the War and in the War and since the War—world power through a monopoly of science. The battle will be taken up and fought over again, and that Grecian horse will be driven

out of the country. American I. G. What an insult to every man, woman, and child in this country! It is a sad thing to find men so money-mad as to be willing to betray their country and their families for just a few more dollars!"

In July, 1929, came the press announcement that the American I. G. Chemical Corporation, representing an alliance between the German Dye Trust and the Standard Oil Company of New Jersey, would establish a \$20,000,000 plant near Monroe, La. It was said in Wall Street that the proposed Louisiana plant would be in a position not only to manufacture dyes but to use a new process for extracting gasoline from petroleum controlled by the American I. G. Chemical Corporation. Oil from the fields in Louisiana and nearby areas is to be used in the process.

During August 3-6 representatives of the U. S. Department of Commerce, from all the principal cities of Europe, and Washington officials and spokesmen of the chemical interests of the United States met in the American Embassy in Paris for a four-day conference to consider the present state of chemistry and chemical industry. The principal object of these sessions was to devise ways and means to stimulate the American chemical trade. During the conference, chemical experts surveyed the entire chemical situation in Europe. Much time was given to an examination of the European chemical cartel's smooth operation, which has given the new American industry strong competition. While the foreign trade of the American industry is very great, the American companies are very keenly aware of the European trust.

It was brought out that there exist three separate divisions in the world chemical trade—the European cartel, probably the strongest, Great Britain, and the United States. Each group is employing the latest methods and ideas and each is going after world trade with a force and efficiency which is creating the swiftest kind of competition. Most remarkable of all, however, is the fact that the United States, within five or six years, had been able to develop her chemical industry to the point where it ranked with the cartel. Twelve years previously, the American industry, practically speaking, did not exist, the American chemical experts explained. By 1929 the United States had become the greatest chemical producer and consumer in the world.

Germany, it was true, remained in the first place as an exporter, owing to her far-sightedness, long before the War, of seeing the advantages politically and commercially, of a strong chemical industry, but in exports, the United States was rapidly catching up. The Americans pointed out that a "U. S. export figure had already been exceeded. It was further disclosed that, a few years before, the foreign chemical interests, viewing with disturbed eyes the American chemical expansion, put their heads together with the idea of crushing the potential new competition. With commendable foresight, however, the Americans obtained the necessary protection to make it possible for them to grow and become strong. It is true that the protection took the form of high protective tariffs; but as the Americans explained, in this, they merely followed the example of their older foreign rivals.

An item from the *Commercial Reports* of the Bureau of Commerce, issued at the beginning of the year, indicated the trend of affairs in Belgium, which also prevailed elsewhere. The for-

mation of the Union Chimique Belge was the outstanding event in the chemical industry during 1928, as being indicative of the transition from small independent units to large central organizations that was taking place and was interpreted as a preliminary step toward further integration. The central organization controlling the production and regulating sales of sulphuric acid would have a total estimated output of 700,000 metric tons, and the erection of a new plant with an additional capacity of 50,000 metric tons was proposed.

The output of sodium sulphate had increased to approximately 100,000 metric tons. Intensive agricultural cultivation was creating a strong demand for chemical fertilizers. Three synthetic ammonia plants had been completed and a fourth was under construction, the total productive capacity was estimated at 85,000 tons. The manufacture of coal-tar derivatives also had shown increased development during the year. The dye industry was producing 50,000 tons of ultramarine blue. The explosive industry was active, its production increasing.

**BIBLIOGRAPHY.** Among the more important works on chemistry published during the year are Allen's *Commercial Organic Analysis* (vol. vii, 5th ed.), on "The Vegetable Alkaloids", Beilstein's *Handbuch der organischen Chemie* (vol. xi and Supplement 2), *Organic and Food Chemistry*, by G. E. Culver, *A Text-book of Inorganic Chemistry* (part i, vol. xi) on "Organometallic Compounds", by J. Newton Friend, the part on "Eisen" of Gmelin's *Handbuch der Anorganischen Chemie, The Constitution of Sugars*, by W. N. Haworth, *Catalytic Processes in Applied Chemistry*, by T. P. Hilditch, *Applied Inorganic Analysis*, by D. F. Hillebrand and G. E. F. Lindell, *The Pyrolysis of Carbon Compounds*, by Charles D. Hurd, *Thyroxine*, by E. C. Kendall, *Reference Book of Inorganic Chemistry*, by W. M. Latimer, *Chemisches Fachwörterbuch*, by A. W. Mayer, *1 Comprehensive Treatise on Inorganic and Theoretical Chemistry* (vol. ix), by J. W. Mellor, *Oxidation-Reduction Potentials*, by L. Michaelis, *The Biochemistry of the Amino Acids*, by H. H. Mitchell, and *Photometric Chemical Analysis* (vol. ii, on "Nephelometry"), by John H. Yoe.

**NECROLOGY.** Thomas Burr Osborne, distinguished for his studies in the field of nutrition and a member of the National Academy of Sciences, died in New Haven, Conn., on Jan. 29, 1929. Frank Austin Gooch, Kent professor of chemistry in Yale University and member of the National Academy of Sciences, died in New Haven, Conn., on Aug. 16, 1929. Karl Auer von Welsbach, eminent for his investigations in incandescent lighting, died in Schloss Welsbach, Carinthia, Austria, on Aug. 5, 1929. William Henry Perkin, Waynflete professor of Chemistry in Oxford, England, died in Oxford, England, on Sept. 17, 1929 (he was the son of Prof. W. H. Perkin, who discovered the first aniline mauve), Raoul Pierre Pictet, well known for his pioneer work on the liquefaction of gases, died July 27, 1929.

**CHESS.** The fact that Dr. Alexander Alekhine, champion of the world, was called upon to defend his title by E. D. Bogoljubow of Tiberge gave significance to the chess happenings of 1929. Dr. Alekhine was successful in retaining his title against the challenger, winning eleven games and losing five, with nine games drawn. The

games of the match were contested at Heidelberg, Berlin, The Hague, Weisbaden, Amsterdam, and Rotterdam. José Capablanca immediately challenged the victor and the match was to be played in October, 1930. Alekhine also made a successful tour of the United States, which was brought to a close by a triumph at the international tournament at Bradley Beach, N. J., in June.

The greatest tournament of the year, the one at Carlsbad in October, was captured by Aron Nimzowitsch of Copenhagen. Capablanca divided second and third prizes with Rudolf Spielmann of Vienna. Capablanca also made the best score for a foreign team which met a British one at Ramsgate. Akiba Rubinstein of Warsaw was the victor in an important tourney at Rogaska-Slatina in Yugoslavia.

The annual Metropolitan Chess League championship competition was won by the representatives of the Marshall Chess Club after a hard battle with the Manhattan Chess Club team. Herman Steiner and Jacob Bernstein both of New York City tied for the State championship at Buffalo. The former won the playoff. Hermann Hahlbohm of Chicago won the Western championship tournament played in St. Louis. Harvard captured the title in the H. Y. P. W. College Chess League, while City College of New York finished first in the Intercollegiate League.

#### CHICAGO. See ILLINOIS

**CHICAGO, UNIVERSITY OF.** An institution of higher education and research situated on the Midway Plaisance between Washington and Jackson Parks on the South Side of Chicago. The university is privately endowed, coeducational and nonsectarian, although three-fifths of its 40 trustees must be Baptists. John D. Rockefeller founded the university in 1890 and his personal gifts amounted to a total of \$35,000,000 over a period of 20 years. Divisions of the university include an under-graduate college, graduate schools of arts, literature, and science and a group of professional schools, including law, medicine, divinity, library science, education, commerce and administration and social service administration. The university year is divided into four quarters of 12 weeks each, including a regular term during the summer. The first class of the college is limited to 750 students, and a selective admission system is in force. On account of changes in student personnel, the total number of persons enrolled at one time or another during the course of the academic year attained approximately 14,000. These figures do not include the enrollment in the home study, or correspondence, department, which has an average of 7000 students at any one time. During the autumn quarter of 1929, 8230 students were in residence for class work. The total enrollment for 1928-29 was 14,443.

The members of the several faculties, exclusive of assistants, numbered 789 on June 30, 1929. In all departments and in all grades of service, the university employed approximately 2300 persons. Important additions to the faculties during the calendar year 1929 included the following: John Shaplev, as chairman of the department of art, Dr. Russell M. Wilder, as chairman of the department of medicine, Dr. Joseph B. DeLee, as chairman of the newly created department of obstetrics and gynecology and Dr. Fred L. Adair, as professor in that department. August Vollmer, as professor of police administration, Karl S. Lashley, as professor of

psychology, Dr Nathaniel Allison, as chairman of the department of orthopedic surgery, Edwin E Aubrey, as professor of Christian theology, Albert S Olmstead, as professor of Assyriology, Eleanor Rontecorn, as professor of legal relations, Leonard V Koos as professor of secondary education, and Floyd W Reeves as professor of education Dr Franklin McLean was appointed director of the university clinics, and Prof Henry A Bigelow was made dean of the law school. Others who were accepted from Prof George A Works, dean of the graduate library school, who became president of Connecticut Agricultural College, and from Prof Katherine Blunt, chairman of the department of home economics, who became president of the Connecticut College for Women. During 1929 seven special professorships known as distinguished-service professorships, were established at the university, each carrying a salary of at least \$10,000. Six of these bear the names of the donors who contributed funds sufficient for their endowment, as follows: Martin A Ryeison, Frank P Dixon, Charles H Swift, Sewell L Avery, Charles F Grey, and Morton D Hull. A seventh was named in honor of Prof Eliakim H Moore.

The assets of the university on June 30, 1929, were \$88,357,337, an increase of \$10,545,116 over the figure for the same date in 1928. These assets were divided as follows: Endowment fund, \$50,889,403, plant fund, \$30,834,067, current assets, \$4,688,994 and other fund assets, \$1,045,873. The total income under the university's combined budget for the fiscal year 1928-29 was \$6,015,538, while expenditures amounted to \$5,991,496. Student fees provided 39.11 per cent of the income and invested funds, 11.88 per cent. A significant factor in the increase of assets was the receipt of gifts during the year amounting to \$6,926,411. Among the important gifts, pledges, and bequests were the following: \$250,000 from a friend of Charles Markham for a medical endowment in his honor, \$250,000 from Julius Rosenwald, \$125,000 from Albert D Laskey and \$75,000 from John Heitz, in support of the university clinics and for medical research, \$400,000 from John P Wilson, Jr., and Mrs William R Dickenson, for an endowment of the law school in memory of their father, John P Wilson, \$177,121 from friends of the late Samuel Deutsch to establish a foundation in social service administration in his honor, \$200,000 under the will of the late H G B Alexander for an endowment in commerce and administration, \$1,000,000 from Max Epstein for the erection of an Institute of Fine Arts, and \$1,500,000 from the General Education Board for the further development of the school of education.

With the completion of five new structures during 1929, the number of buildings operated by the university for educational purposes was increased to 77, including the Yerkes Observatory at Williams Bay, Wis., the buildings of the Rush Medical College on the West Side of Chicago, and the expedition headquarters at Luxor, Egypt, Armageddon, Palestine, and Khorsabad, Iraq. The five buildings opened in 1929, valued at a total of \$3,850,000, were the social science research building, Bernard E Smyth Gymnasium, George Herbert Jones Chemistry Laboratory, botany greenhouses, and Blackstone Avenue power plant. Buildings under construction in 1929, involving an expenditure of \$3,250,

000, were the Chicago Lying-In Hospital and Dispensary, Bobs Robert Memorial Hospital, Bernard A Eckart Hall, for mathematics, physics, and mathematical astronomy, and the botany research laboratory. Plans were formulated for the construction of the following during 1930: Two quadrangles of South-of-the-Midway dormitories, Oriental Institute, art building, Gertrude Dunn Hicks Hospital for Orthopedics, Nancy Adele McElwee Memorial Hospital, International House, Athletic Field House, and a graduate building for the school of education. These projects were estimated to cost \$7,500,000.

The University of Chicago Press published 90 books of a scholarly nature during the year, while publications of faculty members in the various fields, including books, monographs, and articles, totaled over 800. An addition to the list of 13 quarterlies published recently by the Press was the *Journal of Modern History*, introduced under the editorship of Prof Berndtotte Schmidt. Among the scientific achievements of the year were the discovery of the wave-properties of the proton, by Prof Arthur J Dempster, discovery of the pulvex of Sennacherib, by Prof Edward Chiera, conclusion of a study by Prof I S Falk, indicating that a form of pleomorphic streptococcus was the organism responsible for the 1928 influenza epidemic, and the preparation of detailed social statistics on the Chicago metropolitan area by the Local Community Research Committee, a cooperative group of social scientists of the university. Accessions to the university libraries increased the number of bound volumes to 871,276, the number of pamphlets to approximately 400,000, and the number of periodicals received regularly to 4420. On April 17, 1929, Robert Maynard Hutchins, dean of the law school of Yale University, was elected president. He began his administration in September, 1929, and was formally inducted into office on November 19, as fifth president of the university.

**CHILD LABOR** NATIONAL CHILD LABOR

COMMITTEE. In a series of conferences held in December, marking the twenty-fifth anniversary of the existence of this organization, the National Child Labor Committee indicated that it was prepared to resume agitation for the adoption of a Federal child-labor amendment. Speakers before the conference pointed to the fact that the two million gainfully employed children in the United States appeared to be displacing a similar number of adult workers in industry. One of the speakers, Miss Ruth Morgan, vice president of the National League of Women Voters, said in urging the resumption of efforts for a Child Labor Amendment: "The truth seems to be that in the question of child labor, the advanced States continued to go forward, but the backward States are kept very backward indeed. Since the failure of the child labor amendment, only one State with low standards has brought up its State laws to the very moderate standard of the good State laws."

In 1929 the National Child Labor Committee reached the twenty-fifth year of its activity. This organization has consistently applied itself

to the problem of the checking of child labor in industry, and what successes have been obtained in the field must be largely attributed to its efforts. At this point, it is permissible to summarize the progress of child labor in the United States over the quarter of a century. At the time of the organization's founding, there were 1,750,000 children between the ages of 10 and 15 employed gainfully. Of this number, 686,000 were in nonagricultural occupations, 24,000 being in mining and 260,000 in manufacturing and mechanical pursuits. In some States of the Union, no age limits were fixed in the employ of children. In others, 10 years and in some 12, 13, and 14 years were placed as the legal minimums. Compulsory-attendance school laws were nonexistent in 14 States, in many others, they extended only to 12 or 13 years and required attendance for two or three months. Only two States had established an eight-hour day for children under 16, a handful had a ten-hour day, some efforts already had been begun in the direction of checking night work, but this applied only to children under 14 and started with 10 P. M. at night.

In the 25 years that have elapsed, the progress obtained has been extraordinary. Every State in the Union today has one kind or another of a 14-year age limit for entering industry, and a few go up to 15 or 16 years. All States regulate hours of work. Most of them have an eight-hour working day for children under 16. Almost every State restricts night work for children, with 6 or 7 P. M. being the closing hour in two-thirds of the States. In 31 States, the school laws require the completion of at least six grades before a child of 14 may leave school, in 27 States, the requirement is the eighth grade. Twenty-six States require a physician's examination and a certificate of physical fitness before a child of 14 can go to work. All these measures have had an important bearing on the decline of the number of children gainfully employed.

Between 1900 and 1920, the percentage of children 10 to 15 years inclusive dropped from 18.2 to 8.5 per cent. In 1904, only 17 States prohibited the employment of children under 14 years in factories, by 1920, 39 States barred children from factories. In 1904, 5 States prohibited the employment of children under 16 in factories after 7 P. M., by 1920, the total had reached 36 States. In 1904, only 2 States had an eight-hour day for children under 16 years in factories, by 1920 the total had increased to 36.

As these first objectives were realized, the National Child Labor Committee moved forward to new problems. Demands were growing that the entering age in industry should be raised to 15 or 16 years. Such a change would necessitate an overhauling of the educational system in order to make provision for retarded children who were swelling the child-labor ranks. Other problems include vocational education of children, the strengthening of the safety movement, and the creation of special safeguards and supervision for children between the ages of 16 and 18. The National Child Labor Committee appreciates that, with the increasing mechanization and technological unemployment, keeping children out of industry assures their fathers a longer period of employment. Nevertheless, serious education problems must be faced. If chil-

dren are to be kept longer in the schools, what is to be done about those who are mentally retarded and cannot profit from the customary academic programme? In the second place, is it advisable to combine school and gainful work on a part-time basis? The organization has dedicated itself to these principles. "Children must not be allowed to work at too early an age for long hours, at night, in work involving health strain or accident hazard, but equally important, their education must be assured, their vocational aptitudes developed, and when their time for employment comes, they must be aided in making the transition from school to industrial life."

**EMPLOYMENT CERTIFICATES** The Children's Bureau has been collecting figures bearing on the issuance of employment certificates to children between the ages of 14 and 16 for occupations other than domestic service and farm work. During the calendar year 1928, in the 16 States of Alabama, Connecticut, Indiana, Iowa, Kansas, Kentucky, Maine, Maryland, Minnesota, New Hampshire, New Jersey, Oregon, Tennessee, Vermont, Washington, Wisconsin, and also in the District of Columbia, as well as from 65 cities in 15 other States, there were issued 150,269 work certificates. On the basis of the 1920 census, it is estimated that these 14- and 15-year-old children represented more than one-half the children in the two age groups in the United States going to work.

It is significant to note that, for the same States and cities, the 14- and 15-year-olds going to work in 1928 were 6 per cent less than in 1927 and that in 1927 they were 8 per cent less than in 1926. In 1928, as compared with 1927, the reports for 11 States and 29 cities in other States showed decreases varying from less than 1 per cent to 93 per cent in the numbers of such certificates issued. In the State of Alabama, there was a decrease of 13 per cent. In Kentucky, there was a decrease of 17 per cent. In Maryland, there was a decrease of 15 per cent. On the other hand, increases of from 3 to 64 per cent for 1928 over 1927 were reported from the District of Columbia, Kansas, New Hampshire, Vermont, and Washington. In New York City, the decrease was 4 per cent, in Chicago, 2 per cent, in San Francisco, 14 per cent. In Detroit, on the other hand, the gain was 46 per cent. It is also interesting to note that there were considerable increases in the 16- and 17-year-old children, when 1928 is compared with 1927. States and cities for which the information was available reported an increase of 6 per cent in 1928, as compared with 1927. This is to be contrasted with the 12 per cent decrease in 1927, as compared with 1926.

A variety of factors naturally affects these trends. The figures show decreases or increases in opportunities for employment, changes in the school-attendance law, more complete administration of existing laws. For example, in Saginaw, Michigan, which showed a decrease of 93 per cent, the reason was to be found in the adoption of a policy of issuing certificates to children under 16 only if their earnings were necessary for the support of the family. In Sacramento, Calif., a special curriculum of certificates to increase the number of children receiving employment certificates in 1928 (for whom information as to school grade was ob-

tainable), it was found that more than half had completed the eighth or a higher grade in school, while only 24 per cent had completed only the sixth or a lower grade. In the two States of California and New York, where the completion of the eighth grade was required for children 14 years of age (but not for the 15-year-old), the percentage of 14- and 15-year-old children completing the eighth grade was as follows: in Los Angeles, 66 per cent, San Francisco, 83 per cent, in New York, 69 per cent; in Rochester, 61 per cent, in Buffalo, 60 per cent.

**MIGRATORY WORKERS** Dr. G. M. Mangold, in a pamphlet published by the New York Child Labor Committee, was authority for the statement that migratory child workers were on the increase, particularly in those sections of the country where fruit and vegetables were being raised and canned. The increasing use of the automobile had made it easier for whole families to follow harvesting seasons, and, as a result of this, migratory child workers were increasing in the South and West. The increasing use of Mexicans as casual laborers on fruit, vegetable, and sugar-beet farms accounted to a sizable extent for the greater number of child agricultural workers. Dr. Mangold found that the social and physical effects of life in the labor camps were reprehensible. Not only physically, but educationally, children suffer. Very often, in the case of entirely migratory families, children are likely to have no schooling at all. This authority found necessity for immediate State and Federal action, calling for the regulation of labor camps, the provision of traveling schools for the education of migratory children, and more explicit child labor legislation to protect the migratory child workers in agriculture.

Another section of the pamphlet, written by Lillian B. Hill, showed that the problem was particularly acute in the State of California. According to the school census of 1927, there were 36,891 in the State who had no settled homes. The same census showed that there were in the school population 102,405 Mexican children who were for the most part migratory. Miss Hill declared that 85 per cent of these children were engaged in seasonal labor for probably 10 months out of each year. California, in order to cope with this serious problem, enacted legislation for the maintenance of schools for children of migratory laborers. During the period of July 1, 1928 to July 1, 1929, migratory schools established under this act secured from the State and the county in which they were established almost \$20,000. The attending problems are, of course, many. The language difficulty is serious, there is great need for the development of physical education programmes for children who are already overworked and undernourished, retardation is a constant factor, and the continual change from one school to another breaks up social adjustments that may already have been created.

**ENGLAND** On July 18, the English government announced in Parliament that, beginning with Apr. 1, 1931, the compulsory school attendance age in England would be raised to 15 years. Not only is the change expected to improve the educational status of the English child, but it probably will have serious repercussions as far as the unemployment problem is concerned. With the keeping of the child a year longer in the

public schools, the supply of young workers will be decreased. Not only will more work be thrown to the adults, but the increasing physical budget will mean larger employment in the building and maintenance of school plants.

**WISCONSIN.** During the year 1928, the total number of work permits issued to children in the State of Wisconsin (excluding Milwaukee) was 8535. In Milwaukee, the number issued was 5791. In Milwaukee, all children applying for regular work permits are given a medical examination for the purpose of determining their fitness for the particular job they are taking and to discover physical or health defects. Of the 3483 examined, in 1928, only 246 were free from defects. The responsibility for illegal employment in this State is fixed squarely upon the employer, upon whom rests the burden of proof in clearing up the age of the minor. Wisconsin is on the roll of those progressive States which demand increased compensation for industrial injuries received by minors unlawfully employed. If a child of permit age is injured while employed without a permit, total compensation is paid, if he is injured while employed without a permit, in an employment which he is not legally permitted to enter, he is entitled to treble compensation. The history of Wisconsin's experiences has definitely indicated that such added liability is a definite deterrent in checking the illegal employment of minors. During the year 1928, increased compensation was paid in the cases of 53 minors, as contrasted with 1924, when such compensation was paid in 87 cases. In 1924 the total indemnity paid was \$55,819, as contrasted with 1928's record, which was \$17,248.

**MASSACHUSETTS.** The Supreme Judicial Court of Massachusetts on June 1, 1929, confirmed an award of compensation in favor of the dependents of an illegally employed minor killed as the result of an industrial accident. The insurer of the employer had argued that the Workmen's-compensation Act did not apply because the minor was illegally employed. The Court, however, declared that the responsibility rested with the employer, in view of the fact that the Compensation Act specifically declared "that no person shall employ a minor under 18." The Court said further: "The minors are free from statutory inhibitions, their contracts as to themselves are free from the taint of illegality, in each case, they are entitled to similar benefits and to an equivalent amount of protection. . . The violation of the statute subjects the employer to the penalties mentioned in the statute."

**NEW JERSEY.** The Children's Bureau, in a study made of child labor in that State, found that children under 16 years of age were working under conditions considerably more lax than those found in other industrial States. As a result of the study made of the employ of children in Paterson and Newark, it was found that children worked earlier in the morning, later at night, and for longer hours than the law permitted them. In Paterson, the children's working day in vacation time was as long, if not longer, than those of older brothers and sisters who were regularly in industry. The surveyors found that the law of the State had been weakened by adverse judiciary decisions and that laxity on the part of the officials responsible for their enforcement permitted the unfortunate conditions that existed. The survey covered all children in the public schools of Newark and

Pateison under 16. It was found that 4309 children were employed in indoor and street work in Newark. Newark had 176 children under 12 years of age working 48 hours or more a week in vacation and 256 under 12 years working at least 24 hours a week during the school year. In Pateison, the situation was found to be largely similar.

**ILLINOIS** In that State, the total number of industrial accidents involving minors under 18 years of age for the year 1928 was 1028, of whom 945 were involved in accidents that were compensable. Of this total, 101 children were 16 years of age. According to the Illinois law, an extra compensation of 60 per cent must be paid in the cases of children illegally employed. Of the 101 minors under 16, 30 were legally employed and 69 were illegally employed. Of the 69 illegally employed, the following was the extent of disability: fatal accidents, one, accidents in which the disability was permanent, 12, accident in which there was disfigurement, one, accidents in which disability was temporary, 50, accidents in which six or less working days were involved, five. Of the 30 who were legally employed, in the cases of two, fatalities occurred, and in the cases of three, disability was permanent. In the cases of 22, the disability was temporary.

**CHILD NUTRITION** See FOOD AND NUTRITION

**CHILD WELFARE** The YEAR BOOK has referred before to the excellent work that has consistently been performed by the Children's Bureau of the United States Department of Labor, whose chief is Miss Grace Abbott. There is no question that the careful researches being performed by this organization have been one of the factors in the creation of an excellent public attitude toward the problems of child welfare in the home, the school, and in industry. The record of the fiscal year 1929 shows that there were issued 27 new and revised publications of the bureau. Significant reports included "A list of the Psychiatric Clinics for Children in the United States," "Child Labor in New Jersey," "Child Workers on City Streets," "Children in the Street," "Children in Street Work," "The Child in the Court," "Public Dance-Halls," and a "Study of Illegitimate Children." During the fiscal year, the bureau distributed 1,173,430 publications concerned with child care, child management, infant care, and pre-natal care. The Bureau also issued its *Child Welfare News Summary* 30 times during the year.

**BIRTH RATES AND INFANT AND MATERNAL MORTALITY** The birth rate for 1928 in the official birth registration area of the country was 19.7 per thousand of estimated population as compared with 20.7 for 1927. In 33 of the 38 States for which figures for both the years were obtainable, the birth rates were lower in 1928, as compared with 1927. The same States in 1928 had a death rate of 12.3 per thousand, as compared with 11.4 for 1927. Increases were reported in 36 of the 38 States. The infant mortality rate increased in 1928 to 68 per thousand from 64.6 in 1927. The highest infant mortality was 142.2 per thousand in Arizona, and the lowest was 46.9 per thousand in Oregon. In New York State, the number of infants under one year of age dying in 1928 was 14,393. The birth rate in New York State dropped from 19.9

per thousand in 1927 to 19.3 in 1928. The infant mortality rate in New York State was 64.5 per thousand in 1928, as compared with 59.4 per thousand in 1927. In New York City, the birth rate dropped from 21.6 per thousand in 1927 to 21 per thousand in 1928. The infant mortality in New York City increased from 56 per thousand in 1927 to 59.3 in 1928.

In 1922 six countries for which comparable statistics were available, had a lower infant mortality rate than the United States birth registration area, viz., Australia, Irish Free State, New Zealand, Norway, Sweden, and Switzerland. The rate in England and Wales was the same as that of the United States. Despite reductions in this country, the latest available figures for Norway, Sweden, the Netherlands, Australia, New Zealand, and Switzerland still show infant mortality rates lower than the American rate. New Zealand, for instance, reduced its rate from 48 in 1921 to 40 in 1926. The lowest American rate was 47 in Oregon in 1928.

Maternal mortality rates have shown little improvement during the period 1922-27. In 1922 the rate was 66 maternal deaths per 10,000 live births, as compared with 65 in 1927. In the rural areas, the rate dropped from 59 in 1922 to 55 in 1927. The above figures relate to the expanding birth registration area. If the States that were in the birth registration area each year from 1922 to 1927 are considered alone, the reduction in the total maternal mortality rate is considerably greater, dropping from 65 in 1922 to 62 in 1927. Evidently, some progress has been made in the checking of principal deaths from albumen and convulsions, largely due to the programme of education of expectant mothers. The rate from this cause in the States that were in the birth registration area in the years 1922-1927 dropped from 18 deaths per 10,000 live births in the earlier year to 15 deaths in the later year.

**DELINQUENCY** The Children's Bureau was able to report a continuous increase in the number of courts cooperating with it in maintaining its plan for uniform recording of juvenile court statistics. On July 1, 1929, 150 courts had indicated their willingness to cooperate. During the calendar year 1928, 65 courts reported their statistics, as compared with a total of 43 in 1927. During the calendar year 1928, 38,882 delinquency cases, 16,289 dependency or neglect cases, and 10,429 cases of children who were discharged from probation were reported to the Children's Bureau by the juvenile courts cooperating. A juvenile delinquency rate has been determined by calculating the ratio of the delinquent children brought before the court to 1000 population of juvenile court age. These ratios indicate that delinquency is much more common among boys and also that there are unexpected differences which can be cleared up only by studies of local conditions. A number of these ratios for girls and boys are presented here. In San Francisco, the ratio of delinquent boys to 1000 estimated population of juvenile court age in 1927 was 14.5, as compared with a ratio of 1.3 for the girls. In Buffalo, the ratio for the boys in 1927 was 15.9, and in 1928 17.0, as compared with the girl ratios of 1.1 in 1927 and 1.4 in 1928. In New York City, the boy ratio in 1927 was 8.3 and in 1928, 11.6, for the girls, they were 1.4 in 1927 and 1.8 in 1928. In Philadelphia, the ratios for the boys were 27.5 in

1927, and 266 in 1928, as compared with 40 for the girls in 1927 and 42 in 1928.

The survey of the Bureau finds that Negro children are more likely to come to the attention of juvenile courts because of delinquency. Only 5 per cent of the population served by the courts in 1928 were Negroes, whereas 15 per cent of the boys and 21 per cent of the girls dealt with in delinquency cases were Negroes. It is interesting to discover that foreign-born children constitute a very small percentage of delinquent children coming before the courts. In 1928, only 2 per cent of the delinquent white boys and 3 per cent of the delinquent white girls dealt with by the 62 courts were reported as of foreign birth, although in 1920, 27 per cent of the white boys and 24 per cent of the white girls residing within the areas served by these courts were recorded as being foreign born.

The following table indicates the disposition in 1927 and 1928 of delinquency cases disposed of by juvenile courts reporting their statistics to the Children's Bureau.

DISPOSITIONS IN 1927 AND 1928 IN BOYS' AND GIRLS' DELINQUENCY CASES DISPOSED OF BY JUVENILE COURTS REPORTING STATISTICS TO THE CHILDREN'S BUREAU

Disposition	1927 (42 courts reporting)				1928 (62 courts reporting)			
	Boys cases	Per cent disposition	Girls cases	Per cent disposition	Boys cases	Per cent disposition	Girls cases	Per cent disposition
Total	21,244		4,143		32,822		6,060	
Disposition reported	21,088	100	4,116	100	32,739	100	6,041	100
Dismissed (closed after adjustment or continued indefinitely)	11,286	47	1,628	40	14,551	44	2,112	35
Child placed on probation	7,852	33	1,382	34	11,056	34	2,614	44
Child placed in institution	2,675	11	710	17	3,491	11	1,224	20
Restitution fine or costs	1,151	5	51	1	1,715	5	61	1
Other disposition	1,124	5	355	8	1,924	6	652	10
Disposition not reported	156		27		83		17	

\* One of the 43 courts reported too late for the figures to be used in the 1927 study.

\* Three of the 65 courts did not report delinquency cases in 1928.

The following table indicates the character of the offenses committed by the children brought before the juvenile courts cooperating with the Children's Bureau.

CHARGES IN 1928 IN BOYS' AND GIRLS' DELINQUENCY CASES DISPOSED OF BY JUVENILE COURTS REPORTING STATISTICS TO THE CHILDREN'S BUREAU

Charge	1928 (62 courts reporting)			
	Boys cases	Per cent disposition	Girls cases	Per cent disposition
Total	32,822		6,060	
Charge reported	32,667	100	6,021	100
Stealing	14,004	43	727	12
Automobile stealing	1,811	6	26	
Burglary or unlawful entry	4,219	13	13	1
Robbery	698	2	41	1
Other type of stealing	4,720	14	405	7
Type of stealing not reported	2,567	8	212	4
Truancy	2,880	9	752	12
Running away	2,005	6	904	15
Unlawful	2,271	7	1,713	28
Sex offense	564	2	1,158	19
Injury to person	922	3	152	3
Act of carelessness or mischief	9,146	28	179	3
Violating liquor or drug law or intoxication	740	1	65	1
Other charge	472	1	67	1
Charge not reported	155		39	

DEPENDENT CHILDREN The Children's Bureau has, in recent years, sought to be a centralizing

agency for centralizing the practices and the programmes of the various activities in the different States. In view of the fact that, in 1929, there existed in 35 States programmes concerned with child welfare, where public authority has the right to supervise in whole or in part private child-caring and child-placing institutions, it can be seen that the problem has large proportions. In 1920 a series of conferences were held in Washington at the instance of Secretary of Labor Davis in which there participated representatives from 32 States. The chief topic for discussion was dependency and child protection. The Children's Bureau also cooperated with individual States in the studies of the functioning of their Children's Bureaus. During the year, such an investigation was made in Minnesota. There was continued during the year, too, a general study in 10 representative States of the work of State Departments or Boards concerned with the care of children who were socially, physically, and mentally handicapped. The Bureau, too, continued to maintain contacts with the International

American Institute for the Protection of Childhood (Pan American organization), the League of Nations, and the International Social Welfare Conference.

CHILD WELFARE LEGISLATION, 1929 *Child Hygiene* California passed a law calling for the employment of dentists and dental hygienists by towns and cities and also authorized any city or county to establish and maintain tuberculosis preventorium and to receive State aid for the support of indigent persons. In Nevada, a law was passed, permitting any county or group of counties to levy a tax for the purpose of establishing and maintaining public hospitals and training schools for nurses. Laws in Illinois authorized the employment of school dentists. Pennsylvania amended its law relating to the employment of school nurses authorizing two more districts jointly to employ a school nurse. Texas passed a law making physical education courses part of the training in public, elementary, and secondary schools. Colorado and New Jersey authorized Boards of Education to install and operate without profit cafeterias or lunch rooms for school children.

*Child Labor and Compulsory School Attendance* In Illinois, the standard for the obtaining of employment certificates was raised from completion of the sixth to the completion of the eighth grade, and in Missouri from no educational requirement at all to completion of the sixth grade. In Maryland, a new law required completion of the course prescribed for elemen-

tary schools, thus raising the standard for Baltimore to completion of the sixth grade. In California, a new law required that children between 14 and 18 years of age who had left school for work must attend continuation school three hours a day while temporarily unemployed. The same law also provided for vocational guidance for continuation-school children. In Michigan, the law permitting a child over 14 to engage in specified employments during school vacation was amended to provide that such employment might be in any occupation not deemed injurious to health or morals or unduly hazardous. New York made provision for vocational and educational guidance and for the establishment of guidance bureaus as part of the public school system. Michigan amended its workmen's compensation law, requiring double compensation in the case of minors illegally employed (between 16 and 18 years of age) to apply to all minors under 18 years injured while employed. The new workmen's compensation act of North Carolina allowed compensation to all minors, whether legally or illegally employed.

**Dependent Children.** Laws relative to public aid to dependent children in their own homes were amended in the following 12 States: Delaware, Florida, Illinois, Iowa, Maine, Maryland, Michigan, Minnesota, Nevada, New Hampshire, New York, and Wisconsin. Delaware increased from 14 to 16 years the age of children to whom the mothers' pension law was to apply. In Florida, the change in residence requirement for the application of the law was from one year to two years. Michigan also amended its residence requirement. In Illinois, an amendment authorized the State to reimburse counties to the extent of one-half the amounts expended for aid to mothers with dependent children and appropriated \$500,000.

In Iowa, boards of supervisors in counties of 80,000 population or more were authorized to levy a tax not exceeding one mill. In Maine, the law was amended to provide that aid should be paid by the State, which is to be reimbursed by the municipality to the extent of 50 per cent of the expenditure. The Maryland law provided for a system of mothers' aid throughout the State applicable to widows with dependent children under 14 and those with children 14 to 16 who are ill or incapacitated for work. Nevada and New Hampshire increased the maximum amount of allowance authorized. In New York, the law was amended to permit aid in New York City to children of tuberculous parents receiving medical treatment in their own homes. Wisconsin authorized counties of 250,000 to permit food and fuel to be granted to needy families as part of and supplemental to the relief granted under the law. The bill to establish a system of mothers' aid in New Mexico failed of passage.

**Juvenile and Domestic Relations Courts.** Connecticut, Florida, New Jersey, North Carolina, and Tennessee created new courts. New juvenile courts were established in Bridgeport, Connecticut and Broward County, Florida. California made investigation and approval by a probation officer a prerequisite for the filing of a petition of delinquency, dependency, or neglect. New Mexico raised the age of delinquency from 16 to 18 years. The New York Wayward Minors' Act was amended to include within the definition of wayward minors not only those in danger of becoming morally depraved, but also those

who are morally depraved. North Dakota passed a law giving the juvenile courts continuing jurisdiction over children declared delinquent, dependent, or neglected until they reached the age of 21 years. The Ohio law provided for psychological and psychiatric examinations of children coming before the juvenile courts. The new Wisconsin children's code changed the age jurisdiction to include all delinquent and neglected children under 18 and dependent children under 16. Twenty-four-hour schools for pre-delinquent minors 8 to 16 years of age were authorized by a new California Act.

**Offenses Against Children.** Hawaii, Indiana, Michigan, and Texas increased the penalty for kidnaping. Minnesota amended its law which makes it an offense to take indecent liberties with boys and girls under 16. The New York law made it a misdemeanor for a man 18 or over to take indecent liberties with a girl over 10 or under 16.

**Illegitimate Children.** Wyoming passed a law based on the provisions of the Uniform Illegitimacy Act. Such a law is now on the statute books of six States.

**Physically and Mentally Handicapped.** The following States passed legislation concerned with the treatment and care of physically handicapped children: Arkansas, Florida, Illinois, Kansas, Michigan, Connecticut, New Jersey, Maryland, Nevada, and New York. Laws for the establishment of State training schools for the feeble-minded were enacted in Utah and Wyoming. The Nevada law required county commissioners to make provision for the education and the care of feeble-minded children.

**Marriage and Divorce.** California, Hawaii, Maine, New York, and Vermont passed laws relating to the ages of minors contracting marriage. California prohibited the marriage of boys under 18 and of girls under 16. It raised the age requiring consent of parents to boys and girls under 20. In New York, the written approval of a children's court judge, in addition to the consent of the parent, was required for the marriage of a girl between 14 and 16.

**PRESIDENT HOOVER'S CONFERENCE.** In July, President Hoover announced the appointment of a planning committee to call a White House Conference on Child Health and Protection. It was the hope of the President that such a conference would be in a position to take national stock of the progress that has taken place in safeguarding the health and in protecting childhood. In connection with the call for the conference, the President declared: "I need not urge upon you the fundamental importance of this undertaking. The greatest asset of a race is its children, that their bodily strength and development shall prepare them to receive the heritage which each generation must bequeath to the next."

Secretary of the Interior Wilbur was appointed secretary of the committee. The following other persons were members of the planning committee whose function was to be to lay out the agenda for the conference and to divide the work of the organization into special fields: Edgar Rickard, treasurer, of New York City; Dr. H. E. Bernard, executive secretary, of Indianapolis, Ind.; Grace Abbott, Children's Bureau, Department of Labor; Henry Breckenridge, National Amateur Athletic Federation, of New York City; Mrs. Grace S. Burlingham of

St. Louis, Mo., Bailey B. Burritt, the Association for Improving the Condition of the Poor, of New York City, Judge Frederick P. Cabot of Boston, Dr. Frank Cody, Superintendent of Schools of Detroit, Dr. S. J. Crumrine, American Child Health Association of New York City, Dr. Hugh S. Cumming, Surgeon General, United States Public Health Service; Dr. Lee K. Frankel, Metropolitan Life Insurance Company, of New York City; William M. Green, president, American Federation of Labor, Dr. Samuel McHammill, president American Pediatric Society, of Philadelphia, Dr. William F. King, State Health Commissioner, of Indianapolis, Gertrude B. Lane, editor of *The Woman's Home Companion*, of New York City, Mrs. William Brown Meloney, editor, *Herald-Tribune Magazine*, New York City, Mrs. Elizabeth A. Perkins, department of child welfare, World's WCTU, of Evanston, Mrs. Raymond Robins of Brooksville, Fla., Mrs. F. Louis Slade of New York City, Dr. William F. Snow, National Health Council, of New York City, Dr. Louise Stanley, Bureau of Home Economics, Department of Agriculture, French Strother, White House.

The special fields for study and discussion were to be the following: growth and development of the child, medical service and public health, education and training, care of the handicapped child. The principal work of the conference was to be under the direction of Dr. H. E. Bernard of Indianapolis.

It will be recalled that this White House Conference was the third of its kind. The first one was held in 1909 under Roosevelt and ended among other things in the establishment of the Children's Bureau in the then Department of Commerce and Labor. The second conference was under the aegis of President Wilson.

In November, a further announcement was made by Secretary Willbur, which indicated that more complete plans had been effected in the arrangement of the studies to be made. Surveys were to be made in four different fields. The first of these was to be a study of medical service headed by Dr. Samuel McHammill of Philadelphia. This work, in turn, was to be divided into the three sub-sections of pre-natal care, medical care for children, and the study of growth and development. The second section would concern itself with a study of public health service and administration under the direction of Surgeon-General Hugh S. Cumming, head of the Federal Public Health Service. This section had also been further subdivided into studies of public health as it affects communicable disease control, and milk production and control. Section three was to be devoted to education and training under the direction of Dr. F. J. Kelly. This section had been further subdivided into six branches, viz., the family and parent education, the infant and pre-school child, the school child, vocational guidance and child labor, recreation and physical education, and special classes. Section four was to be devoted to the study of the handicapped child and was to be under the direction of Mr. C. C. Carstens, director of the Child Welfare League of America. The work of this group had been divided into the following four sub-sections: Study of the State and local organizations of the handicapped, study of the physically and mentally handicapped, study of delinquency, and study of the dependent child.

**FOUNDATIONS.** In the spring, there was re-

ported the establishment of a unique philanthropy, "The Children's Fund of Michigan" made possible by the gift of \$10,000,000 from Senator James Couzens of Michigan. The grant was accompanied by the following proviso: principal and interest were to be spent in 25 years, the fund was not to memorialize anybody's name, it was not to create an elaborate administrative machinery with buildings and expensive overhead, it was to be spent on child care. Dr. Hugo A. Freund, appointed president of the fund, declared in an early statement that the money would be spent on the following activities: Mental hygiene and child guidance clinics, vocational and educational problems, assistance of group recreation, study of dietetic, hygienic, nutritional, and other subjects bearing upon the health of children. Particularly, attention was to be devoted to the problems of the physically handicapped. Dr. Freund commendably declared: "Nor will any edifice be erected to serve as a centre for the many activities. This fund is for the purpose of assisting and developing those agencies and institutions that are already established; of creating new projects for the welfare of children, and supplementing the work already begun on well-established organization." Another outstanding gift was that made by Mr. August Heckscher of New York. He created a fund of \$4,000,000 to be used in the service of underprivileged children. Unlike Senator Couzens' philanthropy, Mr. Heckscher's was institutional in character. His programme called for the construction of day nurseries, dental clinics, playgrounds and summer camps.

**MOTHERS' PENSIONS.** PREVIOUS YEAR BOOKS have from time to time indicated the progress being made in this important field of social legislation. Recently prepared reports of the U. S. Children's Bureau permit us at this point to summarize the status of mothers' pension legislation in the United States, as of the beginning of the year surveyed. The first State code for the granting of aid to mothers with dependent children was enacted in Missouri in 1911. At first, this applied only to the county in which Kansas City is located, but in the same year the law was extended to operate in St. Louis. The first State-wide mothers' aid law was passed by the Illinois Legislature in 1911. As a result of a popular referendum, Colorado initiated a similar law in 1913. In the same year, the following 18 States enacted mothers' pension acts: California, Idaho, Illinois, Iowa, Massachusetts, Michigan, Minnesota, Nebraska, Nevada, New Hampshire, New Jersey, Ohio, Oregon, Pennsylvania, South Dakota, Utah, Washington, and Wisconsin. In 1915, the following eight States followed suit: Kansas, Montana, New York, North Dakota, Oklahoma, Tennessee, West Virginia, Wyoming. In 1916, Maryland passed a law. In 1917, the Territory of Alaska and the States of Arizona, Arkansas, Delaware, Maine, Texas, and Vermont wrote these laws on their statute books. In 1918, Virginia joined the ranks. In 1919, to the roll were added Connecticut, Florida, Hawaii, and Indiana. In 1920 Louisiana followed. In 1923 North Carolina and Rhode Island followed. In 1925 the District of Columbia incorporated such a law, and in 1928 Kentucky and Mississippi passed similar legislation.

Thus, by January 1, 1929, laws providing for assistance from public funds for dependent children in their own homes were on the statute

books of 44 States, as well as those of the District of Columbia, Alaska, and Hawaii. The only States making no such provision were Alabama, Georgia, New Mexico, and South Carolina. This is not to indicate that these laws have been universally applied despite the general existence of the principle. In a number of States, advantage has not been taken of the existence of the law, while, in a number of other States, work has been done only in a limited number of localities. The original idea concerned itself with aid rendered to dependent children of widows. However, as a result of progressive amendments, there has been a widening application of the law, with the result that, in many States at the present time, the benefits of such aid are extended to all dependent children regardless of the character of the disability of the male parent. Such disability at the present time now includes cases where the father is dead, divorced, physically or mentally incapacitated, in prison, or has deserted his family.

Originally, too, citizenship was one of the requisites for aid, but liberalization, too, has taken place, so that most States at the present time do not require either citizenship or declarations of intention. Only 12 States and the District of Columbia make an exception. In 41 States, a period of residence is required, and in 17 residence is required both in the State and in the local political unit. Of the 23 States specifying a length of residence, 14 require one to two years, 6 require three years, and three require four or five years. Five of the 41 States require that the father must have been a resident of the State at the time of his death or disability. In the majority of the States, no definite mention is made of ownership and property. The administration of these laws is in the hands of a large variety of agencies including juvenile courts, State child welfare boards, State agencies acting in cooperation with local officials, county boards of guardians, county commissioners, probate or circuit courts. It is interesting to observe that the most liberal codes no longer fix by Statute the maximum allowance. In New York City, for instance, the law merely declares "that the size of the grants shall not exceed cost of institutional care." The same is true of Arizona, Colorado, District of Columbia, Hawaii, Kentucky, Maine, Massachusetts, Mississippi, Rhode Island, Virginia. As the result of a long series of trial suits, the principle of most pension legislation has been definitely established as constitutional. Constitutionality of the acts has been passed upon in 15 States. In 1918, the Supreme Court of the United States found the State of Washington act constitutional.

*Great Britain.* On Mar. 31, 1929, the following number of persons was receiving grants on the basis of widows', orphans', and old-age pensions: total, 1,159,607, of whom 200,292 were widows, 216,727 were children, and 455,271 were aged persons between 65 and 70, and 287,377 were aged persons over 70. For the year ending Mar. 31, 1929, \$35,090,000 was paid out in widows' pensions, \$1,146,885 was paid out in orphans' pensions, \$55,917,000 was paid out in contributory pensions to aged people between 65 and 70, making a total of \$92,153,000.

**FAMILY ENDOWMENTS.** In the article on MINIMUM WAGE, reference is had to the efforts, particularly in Australasia to determine a minimum wage on the basis of living standards. It has

followed naturally in these countries that the States have sought to preoccupy themselves with the supplementation of family incomes where wages earned in industry have proved inadequate. This realization has led to the passage in the last two years of family endowment acts. In New Zealand, such a measure was passed in September, 1926, and provided for the payment of allowances to families out of the public funds to be borne by the general taxpayer. Families, in order to benefit under the Act, had to show an average weekly income not in excess of \$19.47. As a result of this, the State was prepared to make a grant of two shillings per child per week in excess of two in the family. (The term "child" under the law was meant to apply to children under 15 years of age.) The act became effective Apr. 1, 1927. At the end of its first fiscal year, it was reported that grants had been made for nearly 10,000 children, beginning with the third child, in 300,000 3000 families whose total number of children was 16,000. The total amount paid in allowances was \$183,233. Of the 3154 families aided, the following were the occupations of the fathers: laborers, 1350, farm hands, 208, farmers, 290, public service, 122, waterside workers, 101, others, 94.

It is interesting to observe the number of children (in excess of two) in the families thus aided:

Number of families having 1 child	
2 children	549
3 "	751
4 "	706
5 "	542
6 "	143
7 "	178
8 "	51
9 "	26
10 "	7

In Australasia, family allowances were entirely restricted to persons in the service of the Commonwealth. In New South Wales, however, a measure was passed in 1927 for the purpose of supplementing family incomes to all workers. The basic wage was declared to be \$20.68 per week for men and \$11.19 for women. In the first year's experience of the Act, there were 40,567 claims received of which 23,310 were granted. In these families, the child beneficiaries numbered 58,375. The amount of endowment paid was \$2,498,000, and the administrative costs totaled \$205,000.

**FAMILY ALLOWANCES.** In 1929, there existed in France 228 family-allowance funds which reached 25,000 affiliated establishments and affected 1,740,000 employees. In 1929, there were distributed by these funds allowances amounting to \$11,446,000. These grants showed an increase of \$1,254,400 over the year 1928. If the figures for public administrations and the private enterprises paying family allowances outside of pension funds are included, the totals are considerably higher. In 1929 the grand total for such family distributions reached \$50,192,000 and the total number of employees concerned was 4,171,000. The leading association in the country presented several bills for introduction into Parliament for the purpose of the extension of family allowance, one of these bills calling for the establishment of a compulsory family endowment fund.

**CHILE, Chile.** A South American republic situated on the Pacific coast of the southern part

of the continent, extending from Peru to the southernmost point Capital, Santiago.

**AREA AND POPULATION** The extreme length of Chile is 2628 miles and the average width is 177 miles, area 290,084 square miles. At the census of 1920, the population was 3,753,709. The Republic is divided into 23 provinces, subdivided into 82 departments and one territory (Magallanes). The populations of the principal cities, according to the census of 1920, with 1927 estimates in parentheses were: Santiago, 507,296 (587,875), Valparaiso, 182,242 (191,750), Concepcion, 64,074 (68,155), Antofagasta, 51,531 (60,331), Iquique, 37,421 (36,200), Talca, 36,079 (35,152). The urban population made up 46 per cent of the total. The great majority of the population is of European descent. In 1920 the foreigners numbered 115,763, as against 134,524 in 1907. The natives comprise the Negrians, for the most part nomadic and living in the southern territories, the Changos, civilized and employed as laborers, in the coast region, and the Araucans, who live in the valleys and on the western slopes of the Andes and number about 101,118. The movement of population in 1926 was: Births, 159,540, deaths, 108,221, marriages, 30,314. The population was estimated in 1928 at 4,024,938. Immigration is small but is encouraged by the Government.

**EDUCATION** Primary instruction is free and compulsory. According to the latest available statistics, there were 4377 public schools, with 438,781 pupils and 9414 teachers. There were also 459 private primary schools, with 1430 teachers and 62,099 pupils, 15 public normal schools, with 2507 pupils and 453 teachers, 96 public and 102 private secondary schools, with 40,084 and 20,536 pupils and 2034 and 1247 teachers, respectively. If public commercial schools, with 181 teachers and 3138 pupils. There are various schools of mines, professional schools, and other special institutions. For higher education, there are the University of Chile belonging to the State, the Catholic University, and two industrial universities, situated at Valparaiso and Concepcion. Other noteworthy institutions are the Pedagogical Institute, the National Conservatory of Music, the National Observatory, etc. There are in addition various lycées and colleges maintained in the provinces.

**PRODUCTION, MINERALS, ETC.** Although agricultural activities are of vital importance to a considerable part of the Chilean population, in surveying the economic structure of Chile as a world market, it is the mineral resources which are of major interest, for the greater part of its exports, as well as furnishing the funds for most of its imports. Prior to and during the World War, Chile enjoyed an unassailable economic position because of its monopoly of natural nitrates, used principally as fertilizer and in the making of munitions, as well as because of the high war time prices prevailing for copper. Prices of nitrate, together with those for iodine, a by-product of the nitrate industry, were fixed by an international association of nitrate producers, this policy being followed until April, 1927, when free sales were adopted. This step was necessitated by increasing competition from synthetic fertilizers, the production of which has been increasing steadily since the War. Eighteen months later, the Government, after a study of the effects of the free-selling plan, announced that it had not permitted the

proper development of the overseas market nor led to economic distribution, and sponsored a new selling agreement among the producers. In 1929 a merger between the principal nitrate interests and the conclusion of a marketing agreement with European producers of synthetic nitrogen promised to improve the industry. Although the manufacturing industries are being developed as rapidly as possible in Chile with the encouragement of a strongly nationalistic Government, the nitrate industry remains the most important in the economic life of the country.

The agricultural zone lies in the centre of the country, the climate permitting the raising of tropical products, as well as those of the temperate zone. Cereals are the leading crops and wheat is the most important. Agricultural production in practically all major groups was greater in 1928 than in 1927 and in the crop year 1928-29 still further increases were recorded. The production in metric quintals of the leading crops in 1928-29, with figures for the preceding year in parentheses, was as follows: Wheat, 7,525,100 (6,341,200), barley fodder, 994,900 (984,800), oats, 766,400 (708,000), rye, 22,100 (20,600). The 1928 tobacco crop was 18.2 per cent larger than that harvested in 1927, the figures being 4,907,000 kilos in 1928 and 4,152,000 in 1927. A severe earthquake in the heart of the agricultural belt of southern Chile in December, 1928, hindered to some extent the rapid recovery of the country from the poor crops and agricultural depression of 1926. Fruit growing has latterly increased and covers an area of approximately 20,000 hectares. (On Jan. 1, 1926, the livestock comprised 323,581 horses, 27,304 asses, 40,187 mules, 1,918,433 cattle, 4,093,872 sheep, 357,033 goats and 246,636 pigs.)

Industrialization of Chile was increasing rapidly. The 1927 figures the latest . . . show 9093 manufacturing establishments, as compared with 7681 in 1925. The 1925 production was 48 per cent greater than in 1920 and 250 per cent greater than in 1912. While the number of plants has shown relatively moderate change, the capital invested in manufacturing increased 213 per cent between 1920 and 1925. Mining and agriculture seem destined to predominate for many years, but the industrialization of the country has already produced a strong trend toward urbanization. The population of the capital city increased 210 per cent, while the total population increased but 59 per cent. A shortage of labor was experienced by a number of industries during 1929. The commencement of reconstruction work in Talca and in surrounding districts damaged by the earthquake of 1928 stimulated industries producing construction materials. Early in 1929, the President was authorized to secure a loan of \$1,250,000 for this purpose. Tariff legislation calculated to protect Chilean industries was enacted in 1928.

Chile is richly endowed with minerals, being next to the largest producer of copper in the world. Other important minerals are gold, silver, cobalt, manganese, coal, nitrate, borate, salt, sulphur, and iron ore. In 1910 Chile produced 64 per cent of the world's consumption of inorganic fertilizers. During the World War, nitrate production reached a peak of 30,010,000 metric quintals (1917), but a post-war depression in the industry cut production sharply, particularly in 1926. A new record of 31,630,000

metric quintals was established in 1928, although prices averaged below the levels of immediately preceding years. During the year ending May 31, 1929, sales of nitrate amounted to 2,750,672 tons. The stock on hand on June 30, 1929, was 1,682,000 tons, as against 1,185,500 tons on June 30, 1928. Consumption of Chilean nitrate increased 53 per cent during the years 1927-29. Production of nitrate in the calendar year 1929 was estimated at 3,200,000 metric tons.

Copper production also reached a new peak during 1928, amounting to about 300,000 tons, or 30 per cent more than in 1927. Copper exports were valued at 608,793 pesos in 1928 and at 442,422 pesos in 1927. The situation in the coal-mining industry was less favorable, production in 1927-28 being 1,482,805 tons, slightly under that for the previous year. Silver, cobalt, manganese, borate, salt, sulphur, and guano are other mineral products. Iron-ore deposits of over 1,000,000,000 tons have been found in the provinces of Atacama and Coquimbo and 1,000,000 tons are exported annually.

COMMERCE: The total value of exports in 1928 amounted to 1,965,900 pesos and the value of imports to 1,169,700 pesos, the increase over 1927 being 16.4 per cent in exports and 9 per cent in imports. The value of some of the leading exports and imports in 1928 and 1927 is shown in the accompanying table.

#### LEADING EXPORTS AND IMPORTS OF CHILE 1927 AND 1928 [Value in thousands of pesos]

Exports	1928	1927
Copper bars	608,793	442,422
Nitrate	935,281	860,155
Wool	58,557	39,827
Beans	26,818	6,739
Frozen meat	22,160	17,948
Imports		
Petroleum	47,743	30,642
Pine lumber	34,835	34,137
Sugar	52,069	39,816
Empty bags	57,047	45,740
Automobiles	33,041	13,392

According to preliminary figures, the United States' imports from Chile in 1928 were over 15 per cent greater than in 1927, when they reached \$62,000,000, while exports from the United States to Chile were 5 per cent greater than in 1927, when the total was \$38,000,000. American importations of Chilean nitrate increased from about \$30,000,000 in 1927 to nearly \$37,000,000 in 1928. The bulk of Chile's foreign trade is carried on with the United States, Great Britain, Germany, Peru, Argentina, France, and India. Imports from and exports to the United States continued their upward trend in 1929.

FINANCE: The ordinary budget for 1929 as approved by Congress provides for receipts of 1,123,291,500 pesos and expenditures of 1,071,603,975 pesos, leaving an anticipated surplus of 51,687,525 pesos. The actual surplus was estimated by the Finance Minister late in the year to be 45,000,000 pesos. The total estimated revenues included the sum of 20,000,000 pesos representing the estimated surplus from financial operations in 1928. The 1930 budget estimated ordinary income at 1,215,000,000 pesos, and expenditures at 1,165,000,000 pesos, leaving a surplus of 50,000,000 pesos. The 1928 surplus actually reached the unexpectedly high total of 34,000,000 pesos, as compared with a surplus of 3,464,052 pesos in 1927 and a deficit of 217,

201,700 pesos in 1926. Ordinary receipts in 1928 were 1,009,600,000 pesos, according to preliminary figures, and ordinary expenditures 971,400,000 pesos. Internal taxes received during 1928 amounted to 282,511,750 pesos and the revenues from the new tariff, which went into effect on Apr. 27, 1928, amounted to 78,000,000 pesos by the end of the year. Estimated revenues and expenditures in the 1929 and 1930 budgets are shown in the accompanying table.

#### CHILEAN ORDINARY BUDGET, 1929 AND 1930

REVENUES (PESEOS)	1929	1930
National properties	41,094,000	32,950,000
National services	76,597,500	80,530,000
Direct and indirect taxation		
Imports	257,500,000	325,000,000
Exports	250,000,000	210,000,000
Income	139,000,000	170,000,000
Other	270,642,000	292,500,000
Various receipts	68,460,000	58,650,000
Total	1,103,291,500	1,189,650,000
Surplus from preceding year	20,000,000	45,000,000
Grand total	1,123,291,500	1,234,650,000
ITEMIZED EXPENDITURES (PESEOS)	1929	1930
Presidency of the Republic	802,180	1,810,000
Congress	7,161,752	7,440,000
Independent services	7,800,000	7,280,000
Interior	113,851,343	155,600,000
Foreign relations	17,607,480	17,200,000
Treasury	412,637,454	434,500,000
Public education	145,029,534	163,500,000
Justice	26,236,362	30,000,000
War	112,734,585	120,000,000
Navy	114,915,815	120,000,000
Industry	55,895,220	65,500,000
Social welfare	40,662,240	42,600,000
Total ordinary expenditures	1,071,603,975	1,165,530,000

The 1929 ordinary expense budget totaled 128,915,000 pesos greater than in the 1928 budget. Of the total, 620,429,271 pesos were set aside for administrative purposes and 235,650,844, for the service of the public debt. There was also included 119,114,200 pesos for social protection and 73,195,000 pesos appropriated as fiscal quotas to special funds and services. The extraordinary budget approved the expenditure of an additional 225,099,000 pesos from the proceeds of external or internal loans which the President was authorized to contract. The latter sum was to be distributed as follows: Interior, 12,149,797 pesos; Treasury, 6,565,500; Education, 22,565,900; Justice, 5,300,000; Navy, 65,050,405; industry, 62,450,000; social welfare, 29,838,789; losses and expenses from loan issues, 21,160,000. The extraordinary budget for 1930 provided for expenditures of 390,797,575 pesos and revenues of 392,420,000 pesos.

Loans totaling \$200,000,000 were reported to have been floated in the United States during 1929, the proceeds of which were to be used for the construction of a new water-supply system for Valparaiso, the improvement of the water-works of 70 other Chilean cities, and the construction of water system for 36 cities now without a public water supply. In addition to the cost of the Valparaiso water system, the government planned to expend \$2,500,000 annually on the other water systems over a period of six years. Another \$190,000,000 raised in North America was to be used for railway, highway, irrigation, and port developments, and the construction of sewers and school buildings.

President Ibáñez, in his message to the 1929 session of Congress, recommended that the revenue derived from the export taxes on nitrate be devoted entirely to improvements in the industry instead of being considered part of the state income for budget purposes. The nitrate law previously authorized the government to subsidize the industry with the export taxes received in excess of a certain amount. Chile now derives less than 20 per cent of its revenues from the export tax on nitrate.

The latest available figures showed a foreign debt on Jan. 1, 1927, of \$26,006,872 and \$64,492,355. The internal debt on Jan. 1, 1926, amounted to 154,220,000 gold pesos and 283,787,030 paper pesos. The Banco Central de Chile reported net profits of 18,727,058 pesos in 1928, as compared with 17,954,943 in 1927 and 10,386,867 in 1926. (Old government note issues, liability for the payment of which was assumed by the Banco Central de Chile when it opened, were reduced from 44,000,000 pesos to below 17,000,000 pesos during 1928. On Sept. 1, 1929, the government reassumed its obligation to redeem those still outstanding. American investments in Chile were estimated at \$500,000,000 in 1928. The peso equals \$0.1217 par of exchange.)

**COMMUNICATIONS.** In 1928 there were 5610 miles of railway in operation in Chile, 3610 miles of which were owned by the state. The private railways are largely British owned. The valuation of all railway properties was placed at 2,665,000,000 pesos. A new line between La Canela and Iquique, completed in April, 1929, opened up the northern section of the Republic and a number of nitrate deposits. Other new lines were under construction. During the year, the government completed the purchase of the Chilean Transandine Line. In 1928 Chile spent 34,957,244 pesos on highway development, of which about 12,000,000 pesos went toward the construction of new roads. Congress early in the year authorized the President to contract loans up to 90,000,000 pesos for use upon roads.

A contract for the construction in Santiago of the first subway system on the west coast of South America was awarded in 1929. In 1926 there were 23,373 kilometers of first-class highways, 16,910 kilometers of telegraph wire, 28,360 telephone instruments in use, and 11,780 automobiles registered (1927). The shipping entered at the ports of Chile in foreign trade in 1926 was 1100 vessels of 3,206,465 tons, cleared, 1044 vessels of 3,001,892 tons.

**GOVERNMENT.** According to the constitution of Oct. 18, 1925, legislative power is vested in the National Congress, consisting of a senate of 45 members and a house of representatives of 132 members. The executive power is vested in the President who is elected for six years, and who is not eligible to succeed himself. The President is assisted by a cabinet, which is responsible to him, and the members of which may speak in Congress but may not vote. Members of a new cabinet, constituted Aug. 24, 1929, are Manuel Barros Castanon, Minister of Foreign Affairs, Enrique Bernudez, Interior, Rodolfo Jaramillo, Finance, Emiliano Bustos, Promotion, Mariano Navarrete, Education; Osvaldo Koch, Justice; Luis Carvajal, Social Welfare; Bartolome Blanche, War, and Carlos Frodden, Navy. President in 1929, Col. Carlos Ibáñez. For NAVY, see NAVAL PROGRESS.

**HISTORY.** Settlement of the troublesome Tacna-

Arica dispute between Chile and Peru was the outstanding event in Chilean history during 1929. Terms of the settlement, under which Chile retained the province of Arica with its nitrate fields and Peru obtained Tacna and the sum of \$6,000,000, were announced May 17 by President Hoover as an act of "good offices." The treaty was formally signed at Lima June 3 and was ratified by the Chilean Senate and Assembly on July 1 and 4, and by the Peruvian Congress July 2. President Hoover, who had been advised of the difficulties in the way of a final settlement during his pre-inauguration tour of South America, proposed the final bases of the agreement to the respective governments on May 15 and the proposal was immediately accepted. Peru and Chile had previously agreed upon most of the questions at issue by direct negotiation. The sulphur deposits of Tacna remain in Chilean territory, while Peru assumed ownership of the canals of Uchusuma and Hauri and complete control of them where they pass through Chilean territory. Chile agreed to provide Peru with a wharf, customhouse, and railway station, and the facilities of a free port, on the Bay of Arica. Children of Peruvian nationals born in Arica are to be considered Peruvians until they reach the age of twenty-one, when they shall have the right to elect their definitive nationality, and children of Chileans born in Tacna shall have the same right. It was agreed to erect a monument commemorating the restoration of friendly relations on the border. On August 28, Tacna was formally placed under the Peruvian flag.

Bolivia, which had hoped to secure an outlet to the Pacific in connection with any settlement of the dispute, protested to Washington against an agreement precluding the subsequent cession of any portion of the disputed territory to a third power. Secretary of State Stimson replied that the settlement left the door open for later adjustment of Bolivia's aspirations among the three interested governments. Chile, however, on May 30, officially stated that she would "never break the continuity of her territory" as established in the treaty with Peru.

By announcing its intention to adhere to the Kellogg Pact early in 1929, Chile broke a deadlock which had existed among Argentina, Brazil, and Chile. Each country had held off, stating that it would not sign the pact until the intention of the other two rival nations was known.

President Carlos Ibáñez remained firmly entrenched in power during the year. In his message to Congress in May, he recommended passage of a new electoral law to make registration necessary before voting and to prevent "the election of persons not interested in the nation's welfare." He announced, however, that he did not advocate a change in the present law which prohibits reelection of a President. In a second message to Congress on July 8, he proposed that women and foreigners of both sexes be allowed to vote in municipal elections. Later, he recommended legislation providing loss of citizenship as the penalty for violation of the law and the loss of Congressional seats by Congressmen who refuse to take the oath of allegiance, who absent themselves from sessions for more than thirty days, or who divulge the proceedings of secret sessions of Congress. An unsuccessful attempt to assassinate him, made by a youth on October 22, greatly increased the President's popularity.

A new penal code, providing for the abolition

of both the death penalty and of life imprisonment, was adopted by Congress and submitted to the President for signature. It fixes a minimum incarceration of 20 years in place of the present alternative sentences of death or life imprisonment. Indemnification of the victims of criminal acts is also provided for.

The worst earthquake since April, 1927, shook central China on August 5, damaging many buildings and interrupting telegraphic and telephonic communications with the capital. Severe storms badly damaged a number of ports, the \$15,000,000 brickwater at Antofagasta being practically destroyed. See ARBITRATION, INTERNATIONAL, also PERU and BOLIVIA, under *History*.

**CHINA.** A Far-Eastern state forming the eastern part of Asia, on the Pacific Ocean, under a republican form of government after Feb. 2, 1912 (capital, under the Nationalist government, Nanking. The name of Peking, the former capital, was changed to Peiping in 1929 by a Nationalist decree).

**AREA AND POPULATION.** China comprises 18 provinces, the so-called dominion of Sinkiang, the dependencies of Manchuria, Fengtien, Kium, and Heilungkiang, and the regions over which only nominal authority exists, viz., Mongolia and Tibet. The area and population of China can be given only as estimates, as in the following table (figures for certain other countries are added for purposes of comparison).

#### AREA AND POPULATION OF CHINA

Regions	Area in square miles	Total	Population Density per square mile
China proper, including the three Manchurian Provinces	1,897,000	436,000,000	238
Mongolia	1,370,000	2,500,000	2
Chinese Turkestan	650,000	1,200,000	2
Tibet	465,000	6,500,000	14
Total, Chinese territory	4,282,000	446,200,000	104
South America	6,850,000	60,000,000	8
United States, exclusive of dependencies	3,620,000	110,000,000	30
Japanese Empire	260,000	80,000,000	107
France (continental)	207,000	40,000,000	150

The Chinese Maritime Customs in 1927 estimated the total population at 457,787,000, including 19,290,000 in Manchuria.

The population of the Great Yangtze Basin is estimated at 200,000,000. The Yangtze Delta, comprising an area of 50,000 square miles, or about that of the State of Illinois, has an estimated population of 40,000,000. Two-thirds of China's population is concentrated in one-third of its area, being densest along rivers and in coastal regions. Mongolia, Turkestan, and the three Manchurian Provinces offer vast areas of fertile lands for settlement and mineral resources for development, but lack of adequate means of transportation and protection against brigandage have discouraged settlement of these sections. The accompanying table gives certain essential data concerning the area and approximate population of the provinces of China.

After these provincial statistics were compiled by the Chinese Post Office, the Nationalist government provided for a number of changes in the internal political divisions of the country. The Province of Chihli was renamed Hopei and

#### AREA AND POPULATION OF CHINA BY PROVINCES

Province (capital)	Area square miles	Population, approximate thousands
Anhui (Anking)	54,826	19,833
Chekiang (Hangchow)	36,680	22,043
Chihli (Tientsin)	118,830	34,187
Fengtien (Mukden)	56,000	17,800
Fukien (Foochow)	48,172	15,158
Heilungkiang (Tsinihar)	203,000	2,500
Honan (Kaukiang)	67,954	30,832
Hunan (Chungsha)	83,198	28,443
Hupeh (Wuchang)	71,428	27,167
Kansu (Lanchow)	125,487	5,928
Kiangsu (Nanchang)	69,498	24,467
Ki-tsi (Nanking)	38,610	37,786
Kweichow (Kweiyang)	105,000	7,500
Kwangsi (Nanning)	77,220	12,258
Kwangtung (Canton)	100,000	77,168
Kweichow (Kweiyang)	67,182	11,115
Shansi (Taiyuan)	81,853	11,081
Shantung (Tsinan)	55,984	30,803
Shensi (Sian)	75,200	9,466
Szechwan (Chengtu)	218,111	49,783
Yunnan (Yunnanfu)	146,714	9,819
Total China proper (approximate)	1,897,000	435,000
Sinkiang (Tihwa)	550,000	2,500
Mongolia (Urga)	1,370,000	2,500
Tibet (Lassa)	465,000	1,500
Grand total (approximate)	4,300,000	442,000

the capital changed from Tientsin to Peking, the name of which was also changed to its original name of Peiping. A new province of Tsinghai was formed from the former special administrative district of Kokonor with Sining and the Sining prefecture of Kansu Province included within its boundaries. A second new Province of Ninghsia was established in the district lying south of the Gobi Desert and north of the Province of Kansu with Ninghsia as the capital.

The former special administrative districts of Jehol, Suifu, Chahar, Chihai, and Sikkang were made provinces with the cities of Chengteh, Kweisan, Kalgan and Kiangling respectively, as the provincial capitals. The seat of the provincial government in Kiangsu Province was moved from Nanking, the new national capital, to Chinkiang. The name of Fengtien Province was changed by decree to Liao Ning. With the new additions, China had the following 30 provinces: Anhwei, Chahar, Chekiang, Fukien, Heilungkiang, Honan, Hopei, Hunan, Hupeh, Jehol, Kansu, Kiangsu, Kiangsu, Kium, Kwangsi, Kwangtung, Kweichow, Liao Ning, Mongolia, Ninghsia, Shansi, Shantung, Shensi, Sikkang, Sinkiang, Suifu, Szechwan, Tibet, Tsinghai, and Yunnan.

There are similar divergences in the estimates of the population of the cities. According to the 1926 census of the Municipal Bureau, the population of Peking was 811,138. The census of the Metropolitan Police Administration, taken in 1927, estimated the population of Peking and its suburbs at about 1,207,718. The estimates for the chief Chinese treaty cities in 1927 given out by the Chinese Maritime Customs were as follows: Shanghai, 1,500,000; Hankow, 1,583,900; Canton, 746,300; Hangchow, 380,000; Tientsin, 800,000; Dairen, 222,400; Chungking, 623,300; Nanking, 360,500; Ningpo, 284,300; Changsha, 535,800; and Soochow, 500,000. The total number of foreigners and foreign residents in China in 1927, according to the Chinese Customs authorities, was 302,153 of whom there were 201,721 Japa-

nese, 68,097 Russians, 11,714 British, 6970 Americans, 2061 Portuguese, 2719 Germans, and 2588 French. The treaty powers in China down to the beginning of 1928 were as follows: Russia, Great Britain, United States, France, Norway, Sweden, Denmark, the Netherlands, Spain, Belgium, Italy, Peru, Brazil, Portugal, Japan, Mexico, Chile, Switzerland, Bolivia, Persia, and Germany. Of these powers, Chile, Germany, Bolivia, and Persia have renounced consular jurisdiction and others have agreed to do so. During 1928 the Nationalist government announced that treaties that had lapsed or were about to lapse would be abrogated and new treaties negotiated on a basis of equality.

**EDUCATION** Education throughout China in 1929 continued in a state of flux. Wherever possible, the Nanking government was reorganizing the educational system on the French model. Their plans contemplated that all academic and administrative work should be centralized directly in national and local educational institutions. The country was to be divided into university districts and in each district there was to be one government university, which, being the highest educational unit in the district, would take over administration. Above these districts, there would be a national university, the highest educational organization in the entire country. The functions of a ministry of education were to be vested in the National University.

In China before the Nationalist movement, there were two kinds of primary schools, the higher and the lower. The former were established by the district governments and were intended as intermediate schools between the lower primary schools and the middle schools. According to the latest available statistics, the total number was 10,236, with 592,579 pupils. At the same time, there were 167,076 lower primary schools, with 3,814,375 pupils. At the beginning of 1929 there were nine government universities, although their status and operations were rather shadowy because of the internal conditions of the country. Numerous mission schools, colleges, and universities at Shanghai and other ports, have a total enrollment of about 500,000. The activities of the mission schools and colleges have been in many cases seriously curtailed owing to regulative legislation by the Nationalist government.

The three forms of native religion are Confucianism, Buddhism, and Taoism. Besides these, there are Mohammedans in all the provinces. The Roman Catholic Church at the end of 1923 maintained 57 bishops, 1481 European priests, and the native Roman Catholics numbered 2,208,800. The Protestant missions in 1920 had 6636 engaged in their service and the Chinese Protestants numbered 618,601. Attached to the Protestant missions were 27 colleges of university standing, 256 middle schools, and 581 higher elementary schools.

**PRODUCTION, ETC.** China is essentially an agricultural country. It has been estimated that the total arable land in the country amounts to 192,060 square miles. The holdings are generally small and the methods of the most primitive kind. Intensive agriculture, with the aid of some irrigation, is commonly found, as is the practice of rotating crops. Horticulture is widely practiced. Wheat, barley, maize, millet, and other cereals, with peas and beans, are chiefly cultivated in the North, rice, sugar, and indigo in

the South. Cotton is grown widely even as far north as the northern part of the province of Chihli, the chief area of production being the Yangtze Valley.

The principal crops of China, with the average annual production and the percentage exported, were estimated as follows: Wheat, 300,000,000 bushels, none; rice, 800,000,000 bushels, none; corn, 100,000,000 bushels, none; peanuts, 600,000 tons, 33 per cent; soy beans, 5,000,000 tons, 65 to 80 per cent, including cake and oil in terms of beans, kaoliang, 200,000,000 bushels, 1 per cent; tea, 800,000,000 pounds, 15 per cent; tobacco, 500,000,000 pounds, 6 per cent; silk, 42,000,000 pounds, 48 per cent; cotton, 2,500,000 bales, 10 per cent. On the whole, crops in 1928 were not as plentiful as in the previous year, particularly in the central Yangtze region and northwest China, where much famine and suffering resulted. During the year ending Jan. 31, 1929, Chinese cotton mills consumed 2,191,000 bales of cotton, of which 267,000 represented imports from America, 418,000 imports from India, and the remainder was principally Chinese-grown cotton. Important fibre crops, including jute, hemp, and abutilon are also grown. Tea is cultivated exclusively in the West and the South. Silk culture, one of the most successful industries in the country, supplies about 25 per cent of the world's supply of raw silk. Swine are raised everywhere in China and pigs' bristles have become an important article of export. Wool exports in 1928 totaled 63,800,000 pounds, as compared with 47,350,000 in 1927 and 18,200,000 in 1926.

A remarkable expansion in China's agricultural productive capacity was taking place as a result of the occupation of vast farm lands in Manchuria by millions of Chinese immigrants. In 20 years, 20,000,000 immigrants were estimated to have settled in Manchuria, the newcomers in 1927 were about 1,500,000. Yet approximately 45,000,000 acres of arable land, or double the area now under cultivation, remained undeveloped. In 1928 Manchuria's crop of soy beans totaled 5,500,000 tons. Millet, Indian corn, and kaoliang are the most important crops grown in southern Manchuria.

An important feature in the development of the Chinese industries is the erection of cotton and woolen mills, and of silk filatures in Shanghai, Canton, and elsewhere, while native looms are found in most dwellings. The estimated production of cotton yarn in China during the year ended June 1, 1927, totaled 1,954,000 piculs, of which 676,000 piculs were produced in Japanese, 1,116,000 in Chinese, and 162,000 in British-owned mills. The estimated production of cotton piece goods amounted to 11,165,000 pieces, of which 5,658,000 pieces were manufactured in Japanese, 4,409,000 in Chinese, and 1,098,000 in British mills. In 1928 there were 120 cotton mills in China with 3,638,098 spindles and 29,788 looms, as compared with 31 mills, 1,008,986 spindles and 4564 looms in 1915. Of mills in operation in 1928, 74 were Chinese-owned, 43 were owned by Japanese, and three by British interests. At the large centres flour and rice mills are beginning to supersede native methods of treating wheat and rice. There are over 150 modern mills.

China is rich in mineral resources, although they are scarcely exploited. The coal fields, which have been rated as the first in the world,

cover an area of 133,513 acres and the average annual output is estimated at 25,000,000 tons. The production of iron ore is estimated at 1,500,000 tons yearly. Oil, both from wells and shale, is being produced in ever-increasing quantities. Copper, tin, antimony, wolfram, gold, and silver also are produced in commercial quantities. China's antimony mines supply about 75 per cent of the world's needs. The combined value of metal and mineral exports in 1927 was 25,000,000 taels (one tael equaled \$0.69).

1927. (Haikwan tael equaled approximately \$0.69 in 1927 and \$0.71 in 1928.) The combined imports and exports for the year totaled 2,187,324,000 taels (\$1,553,000,000). The merchandise trade showed an increase of 13 per cent over that for 1927 and the revenue collected by the Maritime Customs increased about 20 per cent, due to a new tariff schedule. The principal commodities entering the import and export trade in 1927 and 1928 are shown in the accompanying table.

CHINA'S EXPORTS AND IMPORTS, BY COMMODITIES, 1927 AND 1928  
[Quantities and values in thousands—000 omitted]

COMMERCE Political agitation, military operations, commandeering of transportation facilities, labor disputes, and boycotts, while abating somewhat during 1928, revived with the resumption of civil war in 1929, rendering trade spasmodic in some districts and paralyzing it in others. Treaty ports, not disturbed by actual warfare, were, nevertheless, hampered by the same heavy taxes and military exactions imposed elsewhere and by a pervading fear and uncertainty as to the future.

Despite these obstacles, China's imports and exports in 1928 were valued at 1,195,989,000 Haikwan taels and 991,355,000 taels, respectively, as compared with imports of 1,012,931,600 Haikwan taels and exports of 918,619,000 taels in

The 1928 imports showed a gain of 18 per cent in value over those for 1927, notwithstanding an increase in silver exchange which was unfavorable to import development. Chinese exports for the year increased by 8 per cent over 1927, although the crop production for the whole of China in 1928 was reported as somewhat below average for domestic consumption and about average for export products. Approximately 36 per cent of the total foreign trade passed through the ports of Manchuria and North China, while Shanghai and other Central Chinese ports handled 46 per cent and South China ports, 17 per cent.

Raw silk and soy beans were the leading export commodities in 1928, the silk products sold

abroad in 1927 to 187,768,000 taels, or 12 per cent. In 1927, and soy bean products to 213,466,000 taels, an increase of nearly 50,000 taels over 1927. Hides and skins exported increased nearly 50 per cent in 1928 and exports of tea gained by 17 per cent, mostly in the inferior grades. Cotton and cotton manufactures constituted more than one-fifth of the value of China's purchases abroad during the year.

British shipments of cotton piece goods to China and Hong Kong in 1928 totaled 186,521,000 square yards, as against 103,195,000 in 1927,

while American exports of cotton cloth to the same markets dropped to 1,590,000 square yards in 1928. In the same year, Japan shipped 654,442,000 square yards of cotton cloth, or 46 per cent of her total exports of cotton piece goods, to China and Hong Kong. China's exports of cotton piece goods in 1927 were valued at \$9,341,000. The distribution of China's trade by principal countries of origin and destination is shown in the accompanying table. Japan and the United States remained the closest competitors in the Chinese market. Hong Kong, it should be remembered, is largely a transshipment centre for both exports and imports.

**FINANCE.** For the fiscal year ending May 31, 1928, receipts and expenditures of the Nationalist government balanced at 148,256,001 Chinese dollars (1,844,385 taels), as shown in the accompanying table.

For 1929 the revenue was estimated at \$457,000,000 and expenditure, at \$507,000,000. The principal items of revenue in the 1929 budget were salt tax, \$117,000,000, liquor, \$76,000,000, wine and tobacco tax, \$47,000,000, stamp tax, \$13,000,000. Expenditure for military service was placed at \$192,000,000 and for the service of loans, \$156,000,000. The report of Finance Minister T. V. Soong for the year ending June 30, 1929, showed actual revenues of \$434,000,000, of which \$28,000,000 was used for the civil expenditures of the government, \$209,000,000 for military outlays, and the remainder for meeting loan obligations. The figure for military expenses do not include outlays in Manchuria or 11 provinces in China proper which maintained their own armies or in which civil war was waged during the year.

On Jan. 1, 1929, the public debt stood at \$1,034,569,000, converted at par. Of the total sum, \$166,580,000 represented internal loans and \$867,989,000 external loans. The total public debt on Jan. 1, 1926, was placed at \$2,256,537,000. A new Chinese tariff, with rates approximately double those of the former tariff, went into effect in February, 1929, with the agreement of all of the countries having interests in China.

**COMMUNICATIONS.** At the beginning of 1928,

**FINANCIAL OPERATIONS OF NATIONALIST GOVERNMENT FOR YEAR ENDING MAY 31, 1928**

there were 8750 miles of railway lines in China, of which 5555 miles were government-owned, 2305 miles concessioned lines, and 890 miles were operated by commercial and industrial concerns. Railway conditions continued to show improvement until the resumption of civil war in 1929. In North China, a shortage of rolling stock hampered all lines and levies for military requirements remained a heavy burden to trade. The Chinese Eastern Railway (see below, under *History*) made net profits of 27,000,000 Mexican dollars in the fiscal year ending in 1928 (Mexican dollar exchanged at \$0.4647 in 1928). Profits of the South Manchuria railway for the same period were 154,000,000 yen (1 yen had an exchange value of \$0.4040 in 1928).

The merchant marine in 1928 totaled 317,279 tons, of which 315,729 tons were operated by steam or other mechanical power. A total of 154,275 vessels of 116,211,000 net registered tons, entered and cleared the ports of China in 1927 in both the foreign and coastwise trades. Shipping conditions in 1928 and 1929 showed some improvement over 1927, but the difficulties which hindered trade and business after 1920 were still much in evidence, particularly on the Yangtze River. There was a surfeit of tonnage and lack of cargoes on both Pacific and European lines.

A National Highway Planning Commission was organized by the Ministry of Railways in January, 1929, and, after a three months' conference at Nanking, announced a programme for the construction of twelve national arterial highways. In Kiangsu Province, 1036 miles of road were under construction in 1929, in Hunan, some 312 miles of highway had been completed in August, and work on one of the national highways connecting Nanking with Wuhu, the leading trade centre of Anhwei Province, was commenced. There was a fairly well-developed telegraph service, with 52,050 miles of line, and telephones were in use in the principal cities.

**GOVERNMENT** The National government, of which General Chiang Kai-shek is chief executive, remained the nominal government of China during 1929, although a number of the provinces were dominated by quasi-independent war lords. The National government was established by the Kuomintang political party by an Organic Law adopted Oct. 3, 1928, with the State Council, of which General Chiang is chairman, as the highest unit in the system of government. Other members of the State Council were T'an Yen-k'ai, Hu Han-min, Ts'ai Yuan-p'ei, Tai Chi-t'ao, Wang Chung-hui, Sun Fo, Feng Yu-hsiang, Ch'en Kuo-fu, Ho Ying-ch'in, Li Tsung-jen, Li Chi-shên, Yang Shu-chuang, Lin Sen, Yen Hsi-shan, Chang Hsueh-liang, and Chang Chi.

T'an Yen-k'ai was Premier of the Cabinet of Executive Yuan. Hu Han-min was director of the Parliament or Legislative Yuan, and was assisted by the boards of Codification, Foreign Relations, Finance, and Economics. These two, with Wang Chung-hui, Tai Chi-t'ao, and Ts'ai Yuan-p'ei, comprised the Executive Yuan, which is subordinate to the State Council. The government is subject to the control and supervision of the Kuomintang party, of which the Central Executive Committee, the Central Supervisory Committee, and the Central Political Committee are the authoritative bodies. The Kuomintang, while it does not recognize factionalism, is actually divided into a right wing headed by Chiang Kai-shek and Chang Ching-kiang and a left

wing headed by Wang Ching-wei, Mrs. Sun Yat-sen, and Chen Kung-po. The heads of the various government departments were Foreign Affairs, C. T. Wang; Finance, T. Y. Soong; War, Feng Yu-hsiang; Agriculture, Y. Pei-chi; Industry, H. H. Kung; Education, Chiang Mengling; Railways, Sun Fo; Interior, Yen Hsi-shan; Communications, Wang Po-chun, and Health, Hsueh Tu-pi.

## HISTORY

The rapid strides toward national unity, independence, and economic rehabilitation achieved by China under the guidance of the Nationalist government during 1928, were halted to a large extent by severe setbacks in 1929. The resumption of civil war and a diplomatic and military defeat suffered in a clash with Soviet Russia over the control of the Chinese Eastern Railway combined to impair the political unity, and financial stability of the country. The year ended with important provinces under the virtually independent control of war lords antagonistic to the Nationalist régime, and with the radical wing of the Nationalist party, headed by Wang Ching-wei, showing increasing strength.

Nevertheless, definite progress was made toward liberating China of foreign tutelage and control. The first autonomous Chinese tariff schedule since 1842 went into effect on February 1 and the Government gave formal notice of its intention of terminating on Jan. 1, 1930, all extraterritorial privileges held by nationals of foreign powers in China. Of the 21 countries which formerly enjoyed extraterritoriality in China under treaty, a number, including Italy, Belgium, Spain, Denmark, and Portugal, agreed during the year to relinquish this right immediately on condition of satisfactory provision for the treatment of foreigners in Chinese courts. In September, the United States and Great Britain declined to take similar action as requested by the Nanking government. The United States announced its willingness to gradually give up extraterritoriality "as improvements are achieved by the Chinese government in the enactment and effective enforcement of laws based on modern concepts of jurisprudence." Great Britain's reply was similar, envisaging "further modification" in consular jurisdiction. On November 15, Great Britain returned to China the concession of Chinkiang, Kiangsu Province, which was leased in perpetuity in 1808.

**CIVIL WARS** The internal strife, which was continuous from September to the end of the year, was preceded early in 1929 by revolts in the provinces of Szechwan and Hunan. In Shantung, the Nationalist government, after several months of fighting, defeated the second attempt of the former tuchun (military governor), Chang Tsung-chang, to regain control of the province. In Hunan, a revolt by the so-called Kwangsi-Hankow faction, headed by General Li Tsung-jen, succeeded in replacing the Nationalist appointee, General Lu Ti-ping, by General Ho Chien. Although General Lu's overthrow was considered a local issue, it was interpreted as a blow at the Nationalist government's attempt to centralize control of the country in Nanking.

The Nationalist government, after confirming General Ho Chien as governor of Hunan, turned upon the Kwangsi-Hankow generals and crushed a serious revolt at Hankow, with the aid of

Col. Max Bauer, military adviser and former associate of General Ludendorff. The Kwangsi generals had anticipated help from General Li Chai-sun, head of the Canton regional government, and Feng Yu-hsiang, whose nominally Nationalist troops were in Honan. Li Chai-sun was arrested in Nanking, however, and his successor in Canton declared for the Nanking government. General Feng remained neutral, although he resigned as Minister of War in the Nationalist cabinet, pleading illness.

The political significance of these events lay in the fact that the ascendancy of any one of the three political parties in China depended upon the support of the three leading military figures, Feng Yu-hsiang, Yen Hsi-shan, Governor of Shensi, and Chang Hsueh-liang, the Manchurian military leader. President Chiang Kai-shek, head of the Nationalist government, representing the right wing of the Kuomintang or Nationalist party, had secured the nominal support of all three generals in 1928 and the first part of 1929. His government was one of the lauded gentry, and bourgeoisie. The successive revolts which marked the last four months of the year resulted from the withdrawal of actual support from the Nanking régime by all three generals, although Yen and Chang Hsueh-liang remained nominally affiliated with General Chiang's government. The left wing of the Kuomintang profited by these dissensions and increased its power, although none of the war lords was a member of, or in full sympathy with, the aims of the faction, which stood for increased benefits for the workers and peasants. The Communists, who were driven underground by Chiang Kai-shek in 1927, constituted the third party, but exercised little military power.

A strict censorship marked the Third National Congress of the Kuomintang or Nationalist party held in Nanking from Mar 15 to 28, 1929. All three war lords were absent. An appeal for greater unity by President Chiang Kai-shek revealed the state of affairs.

"Is China united?" he asked. "A cursory survey of the political situation shows that it is not. The provincial governments are acting independently in financial matters. They buy arms without the sanction of the central government and recruit soldiers of their own accord. What is worse, the provincial governments are taking advantage of their military strength to dictate to the central government. The recent military conference decided that troops should not be mobilized except by order of the disbandment committee, but hardly had the conference ended than troop movements were begun in the Wu Han area. Political unity has not been achieved."

The Kwangsi clique—Li Tsung-jen, Pei Chung-hsi, and Li Chai-sun—were expelled from the Kuomintang by the Congress.

The death on May 6 of Colonel Bauer (qv), the able soldier credited with directing the Nationalist victory at Hankow, was followed by the outbreak of war between the Kwangsi generals and Kwangtung, where the Nationalist government controlled the leading city, Canton. On May 24, the Government ordered the arrest of Marshal Feng Yu-hsiang, whose rivalry with Chiang Kai-shek for the control of Shantung was considered the motivating cause of revolts against the central government. The threatened outbreak of hostilities between Feng's army of some 200,000 men and the Nationalist forces of 250,000 divided into

two armies, was averted for several months by the intervention of Governor Yen Hsi-shan and others and the alienation of several of Feng's leading generals by the Nanking government. Governor Yen was appointed by President Chiang to succeed Feng as Northwest Frontier Commissioner in control of the provinces of Honan, Shensi, and Kansu, in addition to Shansi. Feng's armies were to remain in their former locations under their own officers.

In September, Feng and other dissatisfied elements found their opportunity in a revolt in Hupeli province led by General Chang Fa-kuei, a prominent Nationalist general of left wing leanings. The revolt spread to the north, south, and west, the principal accession (in October) being Marshal Feng's excellently disciplined troops, known as the Kuominchun. Feng himself did not take the field. On Oct. 28, the commandant of the Foochow garrison in southeast China declared the independence of Fukien province from the Nanking government. Late in September, the left wing of the Kuomintang issued a statement denouncing President Chiang Kai-shek and the entire government group. Twelve members of the central executive committee of the Nationalist party signed the manifesto. Their arrest was immediately ordered by President Chiang, who then left for the front, carrying with him a loan of \$15,000,000 silver obtained from Shanghai bankers.

Reports of heavy fighting in November along the Lunghai Railway in Honan and in Hupeli, in which Nationalist forces suffered several severe defeats, were followed by the sudden collapse of the Kuominchun onslaught and, on November 25, President Chiang returned to Nanking, proclaiming a great Nationalist victory. His success was attributed to the assistance of able German advisers, the judicious distribution of funds among enemy generals, and promises of governmental reorganization. The Nationalists admitted losses of 8000 dead and wounded and placed the casualties suffered by the rebels at over 40,000.

Meanwhile, Chang Fa-kuei's "Ironsides" and the Kwangsi rebels had joined forces and were advancing rapidly on Canton. Reinforcements were immediately rushed south to aid the Nationalist generals. The Nationalist cause profited from Russian aggressions in Manchuria, which at this critical time consolidated national feeling behind the central government. Yen Hsi-shan, remained nominally neutral during the Kuominchun revolt, although he was understood to have supplied Feng's forces with ammunition and supplies.

Afforded a breathing spell by the collapse of the Kuominchun offensive, General Chiang immediately commenced to rush additional troops to Canton, which was threatened by General Chang Fa-kuei's "Ironsides" and the forces of the Kwangsi malcontents. At this juncture, he was confronted with two additional revolts and the Nationalist régime appeared for some weeks on the verge of collapse. In Honan, the forces of General Tang Sheng-chi, which had assisted in turning back the Kuominchun attack, revolted and advanced south toward Hankow. About the same time, a Nationalist division, which had been ordered to Canton, mutinied at Pukow, across the river from Nanking, and retreated north along the Tientsin-Pukow Railway to Pengpu in Anhwei Province. On December 11, the rebels near Canton were decisively defeated by

the government troops. By December 18, General Tang Shengchi's revolt had apparently collapsed and the division which mutinied at Fukow had been defeated and scattered. General Chiang, admitting that the fate of the Nanking government had "hung by a single hair," announced December 18 that the crisis had passed. The future of the Nanking régime was not bright, however. Yen Hsi-shan had taken advantage of the internal strife to gain complete control of Shansi and Chihli provinces and of a vast area of northern China north of the Yellow River, from Honan north to Suiyuan and from Suiyuan to the Mongolian border. Manchuria had become more independent of Nanking's control than at any time during the previous year. Rumors of Gen. Chiang Kai-shek's impending resignation as head of the Nationalist government became increasingly frequent toward the end of the year and General Yen was looked upon as his probable successor.

**CHINA-RUSSIAN RELATIONS.** Relations between the Nationalist government of China and Soviet Russia were in a state of extreme tension throughout 1929. A diplomatic and at times military struggle was waged during the year for the control of the Chinese Eastern Railway, key to the immense undeveloped wealth of Manchuria. In 1924 China admitted Russia to joint control of the railway on condition that the latter would refrain from Communistic propaganda in China. Russia violated this pledge, according to the Nanking government, and on May 27, the Soviet Consulate at Harbin was raided by Chinese police, who reported finding evidence of a Communist plot to overthrow the Nationalist régime. On July 10, the Chinese assumed forcible control of the railroad, arresting many Russian officials and employees and replacing them with Chinese and with White Russians. A Russian ultimatum was ignored and on July 18, the Soviet Government severed diplomatic relations. Troop movements to the border caused the United States and other leading powers to remind both countries on July 19 of their obligations under the Kellogg-Briand Pact. While armed forces faced each other across the border and carried on unofficial warfare by guerrilla raids and airplane bombing expeditions, frontier incidents were continued for months at Harbin and at Berlin.

Warning that more drastic action would be taken if border raids continued, the Soviet Government on September 25 sent a note to Nanking, via the German Foreign Office, in which 28 raids into Russian territory between September 10 and 23 were cited. On the other hand, the Nanking government published a summary of Russian raids, estimating the total damage at \$25,000. Border attacks in October were renewed on a more sanguinary scale than before. Russian forces occupied Linkianghsien, at the confluence of the Amur and Sungari rivers, and advanced southward along the latter river.

Late in November, the Soviet forces, in an extensive operation, captured Hailar and all Manchurian territory west of the Khingan Mountains and overran eastern Manchuria over a 45-mile area to Muling. Chinese resistance crumbled under the blow and Moscow reported that Russian troops had disarmed 8000 Chinese and captured 10,000 rifles. On November 26, the Executive Council of the Nationalist government appealed to both the League of Nations and the individual signatories of the Kellogg-Briand Pact to halt and punish the Russian "invasion" of

Chinese territory. A similar appeal had been issued during the summer.

On December 2, the United States dispatched notes to both the Soviet and Chinese governments reminding them of their obligations under the Kellogg-Briand Pact and appealing to them to adjust the dispute by pacific means. Great Britain and France immediately accepted the suggestion of Secretary of State Stimson that they send similar notes and most of the other signatories to the Kellogg-Briand Pact, with the exception of Germany and Japan, followed suit. In the meantime, the Chinese authorities at Mukden had opened negotiations for a settlement of the dispute, apparently without waiting for Nanking's approval. Announcement that the Soviet and Mukden governments "already had agreed to several conditions and were proceeding with direct negotiations" which would make possible prompt settlement of the conflict between the Soviet Union and China" was made by the Soviet government on December 3 in a scathing reply to the American note. See *Russia*, under *History*.

"In view of this fact," the Soviet note stated, "the above (American) declaration cannot but be considered unjustifiable pressure on the negotiations and cannot therefore be taken as a friendly act."

The Chinese reply to Secretary Stimson's note, dated December 4, declared that military action had been taken purely for self-protection and that China was prepared to arrive at a peaceful settlement of the question. The Nationalist government acquiesced in the steps taken by the Mukden government and the Sino-Russian negotiations were continued at Khabarovsk, in Siberia, until December 22, when a joint protocol was signed. It contained the following provisions: (1) A conference to settle the difficulties between the two powers was to open in Moscow, Jan. 25, 1930; (2) both sides were to withdraw their troops from the border as soon as possible; (3) Soviet and Chinese railroad executives who had been dismissed or had resigned since the beginning of the dispute were to be restored to their position; (4) minor Soviet employees discharged were to be restored with pensions, back pay, etc.; (5) White Russians employed in place of Soviet employees were to be removed; (6) all Soviet citizens and Chinese arrested were to be released without distinction or exception; (7) all orders or instructions issued since the commencement of the dispute were to be canceled unless jointly confirmed; (8) the Chinese agreed to dissolve the White Guard Corps and to expel the leaders and organizers from Manchuria; (9) the Chinese and Russian consuls were to be restored with their previous privileges in East Siberia and Manchuria; (10) Russo-Chinese economic organizations interrupted by the dispute were to be reestablished.

The protocol entered into force from the moment of signature. Manchurian authorities appointed a new Chinese president of the railway board who was acceptable to the Soviet Government, and the latter Government appointed M. Rudyi and M. Denissov as manager and assistant manager, respectively, of the railway, in place of the Chinese managers.

**SINO-JAPANESE RELATIONS.** The none-too-friendly relations between China and Japan were eased somewhat following the fall of the Tanaka cabinet on July 2 and the adoption of a more

conciliatory policy by the new Hamaguchi cabinet. Negotiations for the settlement of the dispute arising out of the Tsunan-fu clash between Chinese Nationalist and Japanese troops in May, 1928, were opened by Foreign Minister Wang and the Japanese Minister at Nanking on January 25, and on March 24, an agreement was announced providing for the immediate withdrawal of Japanese troops from Shantung. Japan also accepted the new Chinese tariff. In January, Premier Tanaka, in an important statement relative to Japan's policy toward China, said that the Government would respect the sovereignty of China over Manchuria and do all in its power to preserve "the principle of the open door and equal opportunity." Calling attention, however, to Japan's economic and political interest in Manchuria, where 1,000,000 Japanese subjects reside, he said the Government was determined "to take appropriate steps" should a state of affairs arise which would jeopardize Japan's vital interests. On May 2, the two governments signed an agreement settling the Nanking and Hankow incidents, China agreeing to pay compensation.

Late in December, a new threat to peaceful relations between the two countries arose when the Nationalist government informed Japan that Torikichi Obata, former Ambassador to Turkey, would not be acceptable as the new Japanese Minister to China. The Chinese Government based its objection to Obata on his connection with Japan's famous 21 demands made upon China in 1915, when he was chargé d'affaires at Peking. The Japanese Government declined to withdraw the nomination, however, considering it a vital test of Chinese-Japanese relations.

The famine areas which are continually to be found in parts of China were considerably extended during 1929. Early in the year, Marshal Feng Yu-huang appealed to the Nanking government for funds or food for 20,000,000 sufferers in the provinces of Honan, Shensi, and Kansu. Dr. C. C. Wu, Chinese Minister at Washington, later announced that the famine affected 57,000,000 people and that thousands were dying daily. The American Red Cross on September 27 declined to undertake famine relief in China in accordance with recommendations of a commission which investigated the situation from June 15 to the end of August. The commission accepted the figure of 65,000,000 as an approximation of those rendered destitute at some time by the famine of 1928-29 and placed the blame upon Chinese militarists and the disorderly conditions prevailing.

At a national conference on military reorganization and troop disbandment held during January in Nanking, it was reported that there were 1,600,000 men under arms in China, and that 78 per cent of the Nationalist government's revenue went for military expenditures in addition to the bulk of the taxes collected by the provincial militarists. The plans adopted for the gradual demobilization of troops and for the substitution of a national for provincial military budgets were everywhere ignored. T. V. Soong, the Nationalist Finance Minister, resigned during the summer because disproportionate military expenditures made it impossible for him to balance the budget. He withdrew his resignation, however, when he was promised that half of the standing armies would be disbanded, a rigid budget system adopted, and that the Finance Minister would be allowed a voice in the expenditure of govern-

ment funds. On August 6, a disbandment enforcement conference at Nanking agreed that the standing army should be limited to 800,000 men. The subsequent revolt nullified these efforts.

The Nanking government exercised a strict censorship over a number of foreign and Chinese-owned newspapers which published reports considered unfriendly to the Nationalist régime. Some of them were denied the use of the mails. Similarly, correspondents of some foreign journals in China were denied the use of cables to send out their dispatches.

On May 26, the body of Sun Yat-sen, "Father of the Revolution," who died in March, 1925, was transferred from Peiping (Peking) to a magnificent tomb built on the side of Purple Mountain at Nanking. During July, the Nationalist government announced that it had signed an agreement with the British Government for the training of Chinese naval cadets in England and the engagement of a British naval mission to assist in the development of a Chinese Navy.

A settlement of the various claims growing out of the Nanking incident of Mar. 24, 1927, amounting to \$887,117 Mex., was agreed upon by the Government.

The Nationalist government, in connection with its reorganization of the nation, called upon numerous Americans and Europeans experienced in governmental problems to assist it. Prominent among them were Prof. Edwin W. Kemmerer of Princeton, who arrived in Shanghai in January to study the economic and financial rehabilitation of China, and Sir Frederick Whyte, first speaker of the Indian Parliament, who was appointed adviser to the Ministry of Foreign Affairs. See MANCHURIA.

An interesting work by Chao-Chu Wu, *The Nationalist Programme for China*, was published by the Yale University Press in 1929.

**CHINDA**, COUNT SUTEMI, Lord Chamberlain to the Emperor of Japan, died in Tokyo, Jan. 16, 1929. He was born in 1856 in Hirosaki, Japan, but went to America and was graduated from De Pauw University in 1881. Returning to Japan, he was appointed a junior official in the Japanese Foreign Office in 1886. In 1895 he went as consul-general to Shanghai, a position followed by appointments to Brazil, The Hague, and Petrograd. He was created a baron for his political services in 1907, and in 1908 was sent as Ambassador to Berlin. In 1911 he was created viscount and sent as Ambassador to Washington. He went in 1916 as Ambassador to England, where he remained until 1920, when he retired. For his services as a member of the Japanese delegation to the Peace Conference at Versailles, he was made a count in 1920. He became an adviser to the Emperor Hirohito of Japan in 1927, receiving the title Grand Chamberlain to the Emperor. As Foreign Minister in Tokyo, he had acted as peacemaker at the conference which came at the close of the Russo-Japanese War, and, again, when he was Ambassador to the United States, he had handled the anti-Japanese situation in California.

**CHIROL**, CHIROL, SIR VALENTINE. An English journalist and writer on the Orient, died Oct. 22, 1929. He was born May 23, 1852, and was educated in France and Germany, receiving the degree of *bachelier-ès-lettres* from the University of Paris. From 1872 to 1876, he was a clerk in the Foreign Office. Resigning this position, he spent the next 14 years in travel, going to European and Asiatic Turkey, to Egypt, Persia,

India, and the Far East, and to the United States and the British colonies. In 1892 he became correspondent for the London *Times* in Berlin; and on the retirement of Sir Donald Wallace in 1899, succeeded to the directorship of the *Times* Foreign Office, a position which he held until 1912. Upon retirement in that year, he was knighted. In that year also he was appointed to the Royal Commission on Indian Public Services. Although his years of travel and his work in Germany had given him a keen insight into European politics, his greatest interest was in Eastern affairs, especially in the government of India. That interest is reflected in his published works, which include *Thracian Greek and Turk* (1881), *The Far Eastern Question* (1896), *The Middle Eastern Question* (1903), *Indian Unrest* (1910), *Cecil Spring-Rice In Memoriam* (1919), *The Egyptian Problem* (1920), *India Old and New* (1921), *The Occident and the Orient* (1924), *India* (Modern Nations Series, 1926), *Fifty Years in a Changing World* (1927).

**CHITTENDEN, FRANK HURLBUT.** An American entomologist, died Sept. 15, 1929, in Washington, D. C. He was born Nov. 3, 1858, in Cleveland, Ohio, and was graduated from Cornell University in 1881. Before becoming associated with the Department of Agriculture, he organized the Entomological Society of Brooklyn, N. Y., and was assistant editor of *Entomologia Americana*. In 1891 he was appointed assistant entomologist in the division of entomology of the U. S. Department of Agriculture. He was placed in charge of breeding experiments in 1902, and in 1905, upon the organization of the Bureau of Entomology, he conducted its special investigations of truck-crop insects. He retired from administrative work in 1923, but gave his time to the investigation of a few groups in the order of insects, Coleoptera. Dr. Chittenden had a remarkable knowledge of insect pests in the crops of the United States. He wrote more than 350 articles and bulletins on economic and taxonomic entomology, and was a contributor to books of reference.

**CHOLECYSTOGRAPHY.** See GALLSTONE DISEASE.

**CHORAL SOCIETIES.** See MUSIC.

**CHORDATA.** See ZOOLOGY.

**CHOSEN.** See KOREA.

**CHRISTIAN CHURCH.** A church originating in three religious movements, that of the Rev. James O'Kelly, who withdrew from the Baptist Church in 1792, that of the Baptist, Abner Jones, who organized a separate church in Lyndon, Vt., in 1801, and that of a group of Kentucky Presbyterian ministers who formed a new denomination in 1804. These groups eventually united, all holding that minor points of belief should be subordinated to Christian brotherhood. In 1929 the Christian Church had 1283 church organizations, 110,326 members, 1047 ministers, 1324 Sunday schools, 801 Christian Endeavor societies, and 307 women's societies. It sponsors home and foreign missions, educational work, publications, evangelism, Christian unity, social service, and other general activities. Its home-mission work includes new Americans in the East, the lumber camps in Washington, Indiana, mountaineers, and Negroes, its foreign field, Japan, Porto Rico, and South America. It also maintains eight educational institutions, including Franklinton Christian College in Franklinton, N. C., in which

colored boys and girls are taught self-help.

The quadrennial general convention, which first convened in Urbana, Ill., in 1826, met in Piqua, Ohio, Oct. 25, 1929, being brought forward a year so as to consider the question of union with the Congregational churches. This plan for the organic unity of the two bodies was the result of the overtures which had been made some years previously to 22 denominations by the commission on Christian unity. It was approved by the National Council of the Congregational Churches at its session in Detroit, May 22 to June 3, 1929, and by the General Convention of the Christian Church on Oct. 25, 1929. See CONGREGATIONALISM. The plan anticipated a complete corporate union under one governing body, the General Council of the Congregational and Christian Churches, with a common administration of all benevolent activities. By the end of 1929, it had been effected in parts of the mission fields and in State field work. The periodicals of the two denominations also were combined, being issued under the title of the *Congregationalist and Herald of Gospel Liberty*. The president of the General Convention of the Christian Church in 1929 was the Rev. F. G. Coffin. Headquarters are at 507 Certified Public Accountants' Building, Dayton, Ohio.

**CHRISTIAN ENDEAVOR, INTERNATIONAL SOCIETY OF.** An organization comprising all Christian Endeavor societies in North America and a member of the World's Christian Endeavor Union composed of Christian Endeavor societies in every country. The first society was organized in Portland, Me., Feb. 2, 1881, by the late Rev. Francis E. Clark for the purpose of training young people in the duties of church membership and the activities of the Christian life. The present name was adopted by vote of the board of trustees in August, 1927, previous to which time it was known as the United Society of Christian Endeavor.

The society is organized into departments to carry on its work. Among the more important are a department of Christian vocations, which yearly gives vocational counsel to thousands of young people in high schools and colleges, and a department of travel and recreation, which supplies, free of charge, monthly church-centered recreation service to Christian Endeavor societies and church workers and conducts world friendship tours to Europe for young people at cost. The society promotes systematic and proportionate giving through the Tenth Legion, in which 1751 were enrolled during the year, and emphasizes regular habits of prayer and daily Bible reading through the Quiet Hour, in which 8453 were enrolled.

The international society comprises an active organization for each State and each Canadian Province. These, in turn, in 1929 were divided into 1200 city, county, and district unions, each including 400 to 500 societies. In the same year, there were throughout the world approximately 80,000 societies, with a membership of 4,000,000. The international society, which meets biennially, held a convention in Kansas City, Mo., July 3-8, 1929, with a total attendance of more than 15,000. The Fiftieth Anniversary International Convention was to be held in San Francisco in July 1931, and a quadrennial world's convention also was planned to be held in Berlin, Germany, Aug. 5-10, 1930. The official periodical of the society is the *Christian Endeavor World*. Officers

for 1929 were: President, the Rev. Daniel A. Poling, vice presidents, the Rev. William Hiram Foulkes and the Rev. Howard B. Grose; treasurer, A. J. Shartle; and secretary, Edward P. Gates. Headquarters are at Mount Vernon and Joy streets, Boston.

**CHRISTIANS.** See DISCIPLES OF CHRIST.

**CHRISTIAN SCIENCE.** A system of metaphysical or spiritual healing discovered by Mrs. Mary Baker Eddy in 1886. The first church was established by Mrs. Eddy in Boston in 1879 and given a charter by the Commonwealth of Massachusetts. In 1892 it was reorganized as a voluntary religious association known as The First Church of Christ, Scientist, in Boston, called more frequently by its adherents "The Mother Church." Mrs. Eddy wrote the textbook of the movement, *Science and Health with Key to the Scriptures*, published in 1875. The Sunday services of the church are conducted by first and second readers, the former reading from *Science and Health*, and the latter from the authorized version of the Bible. In 1929 there were approximately 10,000 practitioners of Christian Science in the United States and other countries, who devoted their entire time to healing the sick through prayer.

A board of directors administers the affairs of The Mother Church. Its annual meeting was held in Boston June 3. Reports indicated expenditures totaling \$1,048,239 from the general fund of the church during the year, \$754,568 from the permanent special funds, and \$134,500 for relief of flood victims in Florida, the West Indies, Alabama, and Vermont. During the fiscal year ending May 31, 65 churches and Christian Science societies, including two university societies, were recognized as branches of The Mother Church, 17 new organizations were located in Europe, three in Africa, one in India, and six in Australia. The total number of recognized branches, including 31 college and university societies, was 2386. Three departments conduct the principal activities of the movement: the board of education, board of lectureship, and committee on publication. The educational board instructs and authorizes students to teach Christian Science, the board of lectureship consists of 24 members who deliver free lectures on Christian Science throughout the world. During the year, 3049 lectures were delivered, of which 3268 were in the United States, Canada, and Alaska, and 381 in foreign fields. Lectures were given for the first time in Czechoslovakia and Poland.

The Committee on Publication aims to correct impositions on the public in regard to Christian Science. It also endeavors to guard the rights of Christian Scientists against restriction by public authority. The Christian Science Publishing Society, which publishes and issues the authorized literature of The Mother Church, operates under a deed of trust granted by Mrs. Eddy, its affairs are now administered by a board of trustees according to the manual of the church. The publishing society issues the daily paper of the organization, *The Christian Science Monitor*, other periodicals include: *The Christian Science Journal*, *Christian Science Sentinel*, *Der Herold der Christian Science*, and *Le Héraut de Christian Science*. The Benevolent Association of the Church conducts a sanitarium, Pleasant View Home, which was opened July 15, 1927. Dr. Frank C. Colby was president of The Mother Church for the year ending May 31, 1929. The headquarters

of the church are at 206 Massachusetts Avenue, Boston.

**CHRISTMAS ISLAND.** An island in the Indian Ocean lying 190 miles southwest of Java, belonging to Great Britain, annexed in 1888. Area, 62 square miles, population, estimated in 1927, 1159. Christmas Island is important because of its very large deposits of phosphate of lime which constitute its only export. In 1927 exports amounted to \$116,651 and imports, to \$4375. The chief imports are tools, machinery, railway materials, and lorries. For administrative purposes, the island was connected with the settlement of Singapore in 1900.

Christmas Island is also the name of the largest atoll in the Pacific Ocean. It belongs to the British colony of Gilbert and Ellice Islands.

**CINCINNATI, UNIVERSITY OF.** An institution for the higher education of men and women in Cincinnati, Ohio, founded in 1870. The registration for the autumn of 1929 was 9079, distributed as follows: Graduate school, 233, liberal arts, 1301, evening courses in liberal arts, 830, education, 1186, engineering and commerce, 1611; evening courses in commerce, 3484, applied arts, 338, law, 180, medicine, 283, nursing and health, 97, household administration, 136. The summer-school enrollment for 1929 was 1224. There were 581 members on the faculty. The endowment funds of the university for the year ending Dec. 31, 1928, amounted to \$6,398,658, the income for the same period was \$2,256,365. The library contained 144,633 volumes. During 1929 a new library building was under construction. President, Herman Schneider, Sc D.

**CITY AND REGIONAL PLANNING.** Activity in city planning continued, as also its recent notable outgrowth, regional planning. Evidence of this is afforded by the list of 691 cities with planning commissions and the list of 840 zoned cities at the beginning of 1930, compiled by the U. S. Department of Commerce and also by the 25 county and city planning bodies established within 10 years. Most of the city and regional planning bodies had little to show except plans and reports—if zoning be ignored for the moment—large portions of some of the plans and minor parts of many others were executed. Street widenings and extensions for thorough traffic and to lessen traffic congestion probably take the lead in construction. Park systems and civic centres probably come next in cost and unpopularity. This leaves out extensive rapid transit construction, limited to New York and a few other cities, also water supply and sewerage, not ordinarily included in

city-planning studies but both rapidly being taken up as district undertakings, sometimes regional in extent.

One of the reasons why there were so many more planning commissions and resulting plans than executed projects was general lack of integration of planning commissions with legislative and executive departments of cities and absence of local government agencies for regions. The latter may embrace parts or all of several counties but not follow county nor even city lines.

**ZONING** Zoning has more concrete examples than any other part of city planning because it is limited to planning of uses to which land may be put, percentages of lots that may be built upon, and heights of buildings and requires no capital outlay. Zoning is a fundamental of planning because upon the use to which buildings may be put, their height, percentage of lot covered, and possible number of occupants depends the planning of streets, sewers, water supply, and transit. Except for number and location of planning commissions and zoned cities, no complete exhibit of city and regional planning exists. The nearest approach to it is a recent survey in all the larger cities of the United States and many smaller ones, the latter chosen by size as representative of the whole country. See *Bibliography*, Hubbard, below.

**REGIONAL PLANNING** Completion of the *Regional Plan of New York and Environs*, by far the largest achievement in city or regional planning yet consummated, was a notable event of the year. The region embraces 436 cities and towns in 22 counties of three States and has an area of 5528 square miles or as large as the whole State of Connecticut or a tenth of the area of England. The population of the area in 1929 was about 10,000,000 which was expected to double by 1965. The work was done by a large staff of engineers, architects, and landscape architects, lawyers, sociologists, and other planning specialists. It was sponsored by the Russell Sage Foundation and directed by a committee of which Frederic A. Delano was chairman. The director of the survey was Thomas Adams. The work took seven years and cost about \$1,000,000. Besides a dozen monographs and a number of pamphlets dealing with various phases of the study, there are two large volumes called the *Graphical Regional Plan*, the first dealing with the plan horizontally—land uses, highways, etc.—and the second taking it up vertically—height and bulk of buildings.

On the question of boundaries for a regional plan vol. 1 of *The New York Graphical Regional Plan* says: (1) "They embrace the area within which the population can and does travel in a reasonable time from home to place of work—that is, the commuting area; (2) they follow the boundaries of cities and counties at the periphery of the commuting areas in order to relate the plan to the areas of administration; (3) they have regard to the physical characteristics, such as watersheds and waterways." The main elements of the *Graphical Regional Plan of New York and Environs* are highways, rapid transit, trunk railways, waterways, airports, parks and parkways, and land uses, including zoning. Maps appropriate to each of these elements, together with descriptive text, are included in the voluminous report.

The second volume (1930) was to go at length into height and bulk of buildings and to include

a project for a municipal civic centre, with an immense building back of the old City Hall, supplementing and dominating the present municipal office building, considered a skyscraper when erected.

Although the Regional Plan was privately made and is non-governmental it was hoped that it would serve as a pattern for the region covered, to which municipalities, individually and by groups, would conform. To promote that end, a regional planning association was organized in 1929. Under its auspices, meetings were held throughout the region at which the plan and its local application were explained. Some of the municipalities had planning commissions, but New York City had none. Some had county park commissions, notably Westchester County in New York State and Essex and other counties in New Jersey. These had already provided or were establishing county-wide park systems, taken cognizance of in the *New York Graphical Regional Plan*. The recently organized Passaic County (N. J.) Park Commission had projected four parks, the boundaries of which were almost identical with those recommended in the *New York Regional Plan*. For a summary of the main features of the *New York Regional Plan* with reproductions of several of its maps—land uses, highway system, rapid transit, trunk railways and airports—see *Engineering News-Record*, June 6, 1929.

A county or group of counties unit embracing 13 cities in Lincoln County, Ohio, including Cincinnati, was organized on March 21, each city being represented by two members chosen by the respective local planning commission and in most cases members of the local commission. In Delaware, the Legislature authorized a regional planning commission for Wilmington and nearby parts of Newcastle County, but it was merely to report on its findings as to "the desirability of establishing a regional plan for Wilmington and vicinity in order to secure an orderly development of highway and other means of communication, sanitation, utilities, and other improvements necessary for the satisfactory development of a modern urban and suburban community." In Wisconsin, a State director of regional planning was appointed (under authority of Laws of 1929, Chap. 287). His duties are to help local planning agencies coordinate their activities, to gather and disseminate city, town, and regional planning information, to cooperate with the State conservation commission in making a recreational system plan for the State and with the State board of health in the regulation and control of lake and stream platting.

**CITY PLANNING.** Progress on the oldest and most notable city-planning programme of the United States was summarized by a number of speakers at the annual convention of the American Institute of Architects, held in Washington the latter part of April, and was presented graphically by maps and models. (For abstracts and pictorial reproductions, see *American Architect*, May 20, 1929). Work under way and projected in general line with the L'Enfant plan of 1791, the McMillan Commission plan of 1901, as revised by the National Capital Park and Planning Commission during the last few years, was to cost over \$200,000,000, of which \$120,000,000 had been authorized by Congress before it met in December, 1929. On December 16, the House unanimously passed a bill authorizing an addi-

tional outlay of \$115,000,000, not over \$15,000,000 of which was for land.

The largest unit in the current programme was the Triangle project for a large group of public buildings to fill, with their proper setting of open spaces, the area having its apex at the intersection of Pennsylvania Avenue and B Street near the Capitol, its base along 15th St., opposite the rear of the White House grounds, and its perpendicular along B Street, N. W., one of the boundaries of the Mall, and its hypotenuse on Pennsylvania Avenue. Toward the cost of the Triangle project, \$25,000,000 had been appropriated for land, and \$50,000,000 for buildings. A huge structure to house the Departments of Commerce and Labor at a cost of \$17,500,000 was under construction, as also a large building for the Bureau of Internal Revenue, to cost \$10,000,000. Diagonally opposite the apex of the Triangle, on the north side of Pennsylvania Avenue, an outlay of \$25,000,000 for a Municipal Centre was authorized—\$6,500,000 for land and \$18,500,000 for a large group of buildings.

These two projects are in accord with the L'Enfant plan to make Pennsylvania Avenue a noble street flanked with public buildings, but unfortunately it does this for only one side of the avenue, leaving the other occupied with buildings of all sorts and heights. The city portion of the Mall, a very broad parked area extending originally from the Mall to the rear of the White House grounds and since carried on from the Washington Monument to the Lincoln Memorial, will be protected by the B Street side of the triangle project.

Another important element of the Washington or District of Columbia plan being executed was the Arlington Memorial Bridge and highway connections, leading from the Lincoln Memorial to the Arlington National Cemetery. This project was estimated to cost \$14,750,000, while the Mount Vernon Boulevard, from Washington to the house of George Washington, will cost about \$5,000,000. The Library, a new home for the U. S. Supreme Court was to be erected. As indicated by its name, the National Capitol Park and Planning Commission is charged with making plans for enlarging the park system of Washington, which, with connecting highways, is considered a major part of the city plan.

A \$19,000,000 bond issue to meet a part of the cost of a street widening and extension in the central business district of Toronto, Ont., was defeated at the city election on Jan. 1, 1930, and with it the city administration that had sponsored the project was also defeated. Opponents of the bond issue urged that a comprehensive plan for the entire city should have been brought forward and objected also to placing the entire cost of the defeated project on the city at large instead of at least a portion of it on the property specially benefited. Indications were that a part of the programme, which had been recommended by an advisory planning commission and modified by the administration, was to be carried out soon, especially the widening of University Avenue, for this, the city had special legislative authority which included the right to use excess condemnation or to buy more land than is needed for the widening and sell the excess after the improvement is made.

Cities of North Dakota were authorized to

levy a one-mill tax for planning purposes and given a certain amount of jurisdiction for three miles outside of their limits by a legislative act of 1929.

The provision of various acts authorizing cities, towns, and villages in New York State to require approvals of the local planning board before a land subdivision plan may be filed with a county court was upheld by the New York State Court of Appeals on Dec. 3 (Village of Lynbrook v. George J. Cadoo et al.). The court stated "Town planning is a new field of legislation, comparable with the recent development of zoning laws and regulations. Its purpose is to preserve through a governmental agency a uniform and harmonious development of the growth of a village [in this case] and to prevent the individual owner from laying out streets according to his own sweet will without official approval."

**ZONING** A comprehensive zoning ordinance for Cleveland, Ohio, was enacted by the city council in May and approved later on referendum by a vote of about 64,000 to 44,000, this being one of the few zoning ordinances ever submitted to popular vote. *Newark, N. J.*, was divided into seven zones or districts by an ordinance introduced Nov. 20, 1929. There are three grades of residence, two of business, and two of industrial uses. The ordinance sets limits on height, percentage of lot built upon, widths of side yards, depths of front and rear yards, dimensions of inner and outer courts and density of population, with some exceptions, chiefly as to depth of front yards in business and industrial districts. Height limits are two and one-half stories in both first and second residence districts, while in the third residence and first business districts they may not exceed twice the street widths, but no street may be considered more than 60 feet wide. In the second business district, the street wall cannot exceed two and one-half times the width of the street, the width here also to be held as not over 60 feet in both industrial districts. Total heights in the second business and the two industrial districts are not limited provided (1) if "above a given level" the building covers not more than 25 per cent of the lot area, and (2) if the building thus contracted in area "sets back from each of its lot lines at every level at least one inch for each one foot that such level is above the curb level."

There are also some height exceptions based on setbacks for second business and industrial districts, that is, for every five feet of setback, the height may be increased one foot. Percentages of lot that may be covered by buildings range from 35 per cent for an interior lot and 45 for a corner lot in first residence districts, to 60 and 70 in the second and 70 and 90 per cent in the third residence district, and 90 to 100 per cent in all the other districts. These percentages are in a measure governed by width of side and depths of rear yards, and dimensions of inner and outer courts, detailed in the ordinance. Density of population is fixed at 2000 feet of lot area per family in first and 1200 feet in second residence districts, while for third residence districts there may not be more than one family per 1000 feet of lot area per story.

In general, residences in business and industrial districts are the same as those for residences in third-class residence districts, except that, in the second industrial district, the only residences permitted are for the family of one watchman for

the Seine in the National Assembly. In 1875 he was president of the Municipal Council of Paris and a member of the Chamber of Deputies for Paris from 1876 to 1885. He was minister of the Interior in 1906, and from 1906 to 1909, Premier of France. Active as a journalist, he had founded *La Justice* in 1880, and though often out of office for long periods of time except for his seat in the Chamber of Deputies, Clémenceau was always a force in the public life of France. So many cabinets were overthrown through his influence that he became known as the Destroyer of Ministries. With him, the professions of journalism and politics were closely related. He was one of the literary men who in the newspaper, *L'Aurore*, championed the cause of Captain Alfred Dreyfus, the wrongfully imprisoned French soldier.

When his paper, *L'Homme Libre*, was suppressed at the end of 1914 because of attacks made in it on the French government, he immediately founded another, which he called *L'Homme Fuchaine*. Long before the World War began, Clémenceau had predicted its coming and warned France to be prepared. At the outbreak of the War, he was president of the Foreign Affairs Committee, later becoming president of the Army Committee of the Upper Chamber. In 1917, when the morale of France was at low ebb, Clémenceau was asked to form a ministry. His flaming enthusiasm, his courage, even his ruthlessness in mobilizing men and resources for the nation, was what France needed to take her victoriously through the last years of the War. M. Clémenceau was duly lauded as the Savior of France, the Father of Victory, and he was elected a member of the French Academy in 1918. As chairman of the Council of Four at the Versailles Peace Conference, Clémenceau's militant ideas and un concealed concern for France clashed with the more idealistic views of President Wilson. Nor did his often arbitrary methods meet with the same approval in France after the Armistice as they had done before. In 1920 his premiership ended, and when he was not chosen a candidate for the presidency of the Republic, he retired from public life. After retirement, in 1922, he visited the United States as an unofficial lecturer on America's responsibilities with regard to Europe. In 1927 he published an exposition of his philosophy, *Au Soud de la Pensée*, which was translated into English in 1929 under the title, *In the Evening of My Thought*. At his own request, he was not given a state funeral, but was buried privately in a little wood beside the village of Colombier near Roche-sur-Yon in Vendée. Public honors, however, were paid to his memory by heads of governments throughout the world. Consult *Clémenceau, sa vie, sa œuvre*, by G. Geoffroy and Lumet (1920) and *Clémenceau* by Jean Martet (1929).

#### CLEVELAND MUSEUM. See ART MUSEUMS

**CLIFFORD, LUCY LANE** (Mrs. William Kingdon). English author, died Apr. 21, 1929, in London. In 1875 she was married to William Kingdon Clifford, a distinguished mathematician, and their home became a meeting place for the scientific and literary men of the late Victorian period. Mrs. Clifford's first novel, *Mrs. Keith's Crime* (1885), had as its theme the problem of parents of a hopelessly ill and suffering child. The solution, merciful death for the child, caused widespread discussion. Her second book, *Aunt*

*Anne* (1893), was also successful. Besides being the author of a number of novels, Mrs. Clifford also wrote plays, among them *The Likeness of the Night*, *The Searchlight*, and *A Woman Alone*, all produced in London theatres.

**COAL.** The world's production of coal of all grades in 1928 was estimated at approximately 1,450,000,000 metric tons (A metric ton is 2204.6 pounds, roughly the same as the gross ton of 2240 pounds). Of this grand total, 217,000,000 tons were lignite and 1,233,000,000 tons were bituminous coal and anthracite. In 1913, the last year before the World War, the production of lignite was 129,000,000 tons and the production of bituminous and anthracite was 1,213,000,000 tons. In 1928 the world's production was slightly less than that of 1927, 1,473,000,000 metric tons, which was the largest production since 1913.

It was quite interesting to note that in the quarter-century before 1913 the production of bituminous and anthracite coal grew at the average rate of 31,000,000 tons per year, while in the entire 15 years between 1913 and 1928 it had amounted to only 14,000,000 tons. The coal and lignite produced in the principal countries of the world in the calendar years, 1925-28, are given in the tabulation on pages 199 and 200, while the following table indicates the world production of coal of all grades 1914-28.

#### WORLD PRODUCTION OF COAL OF ALL GRADES, 1914-1928\*

Year	Production, in part estimated (metric tons)	Percentage produced by United States
1914	1,207,000,000	38.7
1915	1,198,000,000	40.5
1916	1,291,000,000	41.5
1917	1,356,000,000	43.6
1918	1,373,000,000	46.3
1919	1,373,000,000	42.8
1920	1,320,000,000	45.3
1921	1,135,000,000	40.5
1922	1,226,000,000	35.3
1923	1,359,000,000	43.9
1924	1,357,000,000	38.2
1925	1,372,000,000	38.5
1926	1,365,000,000	43.7
1927	1,470,000,000	36.9
1928	1,450,000,000	34.7

\*Includes lignite and subbituminous coal as reported, without attempting to reduce to equivalent tonnage of bituminous coal.

**UNITED STATES PRODUCTION OF BITUMINOUS COAL.** The total production of soft coal in the United States during the calendar year 1929, including lignite and coal coked at the mines, was estimated by the U. S. Bureau of Mines at 532,352,000 net tons. This figure represented the total of the bureau's estimate made for the 52 weeks in the year and was subject to slight revision compared with the output in 1928, namely, 500,745,000 net tons, the 1929 figure indicating an increase of 31,608,000 tons, or 6.3 per cent. Figures for the calendar years 1922-29 are given on page 200.

The increase in the production of bituminous coal in 1929 over 1928 was due in large measure to the increased use by electric utilities, railways, and steam plants and was of special significance in view of increased competition from natural gas. The consumers' stock of bituminous coal on Jan. 1, 1929, was estimated at 41,800,000 net tons, as compared with 55,500,000 net tons as of Jan. 1, 1928. On July 1, 1929, consumers' stock declined to 33,100,000 net tons and on October 1 there were in the hands of consum-

COAL AND LIGNITE PRODUCED IN THE PRINCIPAL COUNTRIES OF THE WORLD IN THE CALENDAR YEARS 1925-1928, IN METRIC TONS

\* Figures for calendar years 1922-1928 are final figures, as reported by the operators. Those for 1929 are preliminary estimates.

b Subject to revision

ers 37,500,000 net tons, or a net decline in amount of 4,307,000 net tons since January 1.

Soft coal production during 1929 was on the whole undisturbed by labor troubles and was affected by the usual seasonal fluctuations in demand and production. The average spot price for the year at the mines was \$1.79, ranging from a minimum of \$1.68 in May to \$1.90 in October. A notable feature of the bituminous industry during the year was the steady and increasing shipment of cargo coal via the Great Lakes which amounted to 37,933,240 net tons, as compared with 33,402,121 tons in 1928.

During 1929 the exports of bituminous coal increased, amounting to 13,477,877 gross tons for 11 months, as compared with 13,338,891 gross tons in the previous year, Canada taking the greater proportion of the increase, with Italy second. Exports to Cuba, the second largest importer of American coal, decreased slightly, as compared to the previous year.

## UNITED STATES PRODUCTION OF ANTHRACITE

COAL. Estimates of production by the U. S. Bureau of Mines for the Pennsylvania anthracite coal fields for the year 1929 amounted to 76,640,000 net tons. This estimate was based on the available reports of cars of anthracite loaded by the railroads including an allowance for colliery fuel and local sales within the anthracite region and for dredge and washery coal. Previous experience indicated that this estimate would prove to be within 1 or 2 per cent of the exact figures later reported by the company auditors. In 1928, for example, a similar estimate was 1.8 per cent higher than the final figures, namely, 75,348,000 net tons. Accordingly the 1929 figure was apparently 1.8 per cent lower than the 1928, and this apparent gain, if it is in case the estimate was too high. It was believed, however, at the end of the year by competent authorities that the production of Pennsylvania anthracite in 1929 was slightly greater than in 1928. Figures for the years 1925-29 are given below.

## PENNSYLVANIA ANTHRACITE PRODUCTION

Year	Net tons
1925	61,817,000
1926	84,437,000
1927	80,096,000
1928	75,348,000
1929	76,640,000

SHIPMENTS BY MONTHS. In the following table is shown the shipments of anthracite by months in 1928 and 1929, as reported by the carriers to the Anthracite Bureau of Information. Those for December, 1929, were estimated by the bureau and may be modified somewhat by the temperature records.

	1929	1928
January	5,811,972	4,523,139
February	5,168,197	4,374,886
March	3,628,691	4,175,482
April	5,160,620	5,603,876
May	4,817,334	6,313,174
June	3,778,679	3,990,698

September	5,380,130	4,640,995
October	6,477,729	6,770,806
November	4,615,464	5,759,031
December	5,550,000 *	4,844,050
Total	58,570,728	59,778,693

\* Estimated

Outside of Pennsylvania, Virginia, Arkansas, Colorado and New Mexico were the leading producers of anthracite, the total output in 1928 amounting to 712,406 net tons, valued at \$2,983,978, or an average of \$4.19 per ton. Of this amount, Virginia alone contributed 171,896 tons, valued at \$477,187, or \$2.78 per ton. The production of hard coal outside of Pennsylvania was of considerable interest again the interval since 1913, when it was 363,324 tons, it had practically doubled. The records of 786,594 and 843,125 net tons in 1921 and 1920 respectively, with the demand for higher grade household fuels were stimulated by the long season of mining in Pennsylvania anthracite fields. The 1928 production reported a gain of 9.3 per cent over 1927 when the total production was 651,860 net tons. Not only had there been an increase in the amount of hard coal mined in the period considered but a gain from \$2.58 to \$4.19, or approximately 62 per cent. The period of greatest prices was from 1919-23, when averages ranged from \$4.91 to \$5.75.

As the table indicates, the progressive decline in anthracite production since 1926 was checked for the first time and an increasing export business was recorded with 2,728,313 gross tons for the first 11 months of 1929, as compared with 2,720,177 gross tons for the corresponding period of 1928. In the latter part of the year, the mild weather caused considerable decline in purchases. An interesting development of the year was the use, by the anthracite interest, of the Frost Research Laboratories in Norristown, Pa., for testing and determining stokers, heat-control devices, and automatic systems, as well as for conducting various burning tests to determine accurately the relative efficiency of anthracite and other fuels. A new type of magazine-fed boiler was developed, as well as a mechanical stoker.

According to the Anthracite Bureau of Information, during the year 1929 there were a number of anthracite companies had either completed or begun extensive construction programmes. The most ambitious of these were the plans of the Philadelphia & Reading Coal and Iron Co. which included the construction of at least two new breakers and electrification of or installation of modern machinery in its other collieries. To quote the president of the company in a statement made by him, the "concentration and consolidation of coal preparation plants on their properties in Pennsylvania, together with complete electrification both of mechanical equipment and of transportation, stand out as high lights in the company's extensive programme. A much greater degree of efficiency and economy in the production and preparation of Reading anthracite is expected to result from these de-

velopments." At the close of the year, one of the new breakers was approaching completion. It was to be the largest breaker in Pennsylvania, which meant the largest in the world. The Lehigh & Wilkes-Barre Coal Co. also began the excavation of a drainage tunnel to cost \$3,000,000, by which it was expected to drain several of its collieries to the south of Wilkes-Barre.

Other interesting developments, as reported by the Anthracite Bureau of Information, were the mechanization of the anthracite industry. The human slate picker, usually young boys or old men incapacitated for heavier work, and once the subject of sob-producing stories peculiar to the anthracite industry, had disappeared. Likewise, the mine mule, once occupying as important a place in the anthracite industry as did his brother the "mule" in the military establishment, had given or was rapidly giving place to a mechanical rival, a victim of the age of machinery. The modern breaker was equipped with mechanical slate pickers and such new coal-cleaning devices as the Chance separator, the Rheolaveur, and the hydrotator, to the operation of which was credited in no small degree the improvement in the quality of the anthracite being shipped to market.

**BIBLIOGRAPHY.** During the year, an important publication, *Anthracite in 1928*, by O. E. Kiesel and H. L. Benoit, was published by the U. S. Bureau of Mines, presenting in printed form the final statistics of the Pennsylvania anthracite industry in 1928. In addition to the standard tables of production, value, men employed, days worked, etc. the report contained data on the following subjects: Losses in shipments and fuels used in place of anthracite, decline in prices of domestic coal, the movement toward mechanized heating, automatic heat and anthracite, anthracite's effort to meet competition.

**COCHIN-CHINA**, *Kochin chiná*. The southernmost colony in French Indo-China (see *FRENCH INDO-CHINA*). Area, estimated at 26,476 square miles, population estimated in 1928 at 4,119,832, consisting chiefly of Annamites, Cambodians, Mons, Chams, and Chinese, with a few Indians, Malays, Tugals, and 1927 there were 16,308 French and 10,000 foreigners. Saigon, the capital, had a population in 1927 of 123,550, of whom 13,150 were Europeans. Cholon had a population of 198,713 of whom 93,556 were Chinese. There are about 1445 schools with 3337 teachers and 101,404 pupils. About four-fifths of the 2,410,834 hectares under cultivation are given over to rice. In 1927, 5,118,000 acres were under its cultivation and in the same year the production of cleaned rice amounted to 1,493,327 metric tons. Other crops are maize, beans, sweet potatoes, groundnuts, cotton, rubber, sugar cane, tobacco, coffee, coconuts, pepper, oranges, bananas, etc. Other sources of wealth are livestock and fisheries. The output of the latter being valued at 2,800,000 francs annually. There are 11 rice mills in Saigon and Cholon, which turn out 3000 tons of rice daily. There are also in these cities two sawmills, two soap factories, and a varnish factory. Commerce is largely in the hands of the Europeans and Chinese, although the Annamites are traders on a small scale. The total exports in 1927 amounted to 2,854,879,872 francs and the total imports, to 2,314,754,255 francs. In 1928 the local budget balanced at 19,810,136 piastres (par value of the

piastre equals \$0.50) Trade is carried on mainly through the port of Saigon, which was visited by 882 steamers of 2,029,297 tons in 1927. Cochinchina is ruled directly by a governor and a council of 24 members.

**COINS, VALUES OF FOREIGN** The legal estimates of the values of foreign coins on Jan. 1, 1929, as issued by the Secretary of the Treasury are given in the table on page 203.

**COKE.** Naturally, with the increased production of pig iron during the year 1929, the output of coke made a record for by-product coke and an increase in production of beehive coke. The 1929 figures are shown in the accompanying table.

**PRODUCTION OF COKE AND PIG IRON, 1925-29**  
[Figures for coke in net tons, for pig iron in gross tons]

Year	By-product Coke	Beehive Coke	Total	Pig iron
1925 *	53,473,500	6,015,000	59,490,500	42,285,609
1926	48,713,025	4,492,804	53,205,829	37,847,804
1927	43,885,000	7,207,000	51,092,000	36,232,306
1928	44,377,000	12,489,000	56,866,000	39,070,470
1929	39,912,000	11,355,000	51,267,000	36,403,470

\* The figures for 1929 are estimates subject to revision when final returns are furnished by the coke operators.

The total quantity of coal consumed at by-product plants in the United States during 1929 was estimated at 77,162,000 net tons, as against 70,165,906 tons in 1928, an increase of 10 per cent. Beehive ovens consumed 9,354,000 tons of coal in 1929, as against 7,017,974 in 1928.

The production of by-product and beehive coke for groups of States for the calendar years 1928 and 1929 (estimated) are given in the accompanying tabulation.

**PRODUCTION OF COKE BY GROUPS OF STATES**  
[Net tons]

	Calendar years	
	1928	1929
<b>By-product coke—</b>		
New England, New Jersey, New York, east of Buffalo district	4,966,756	4,216,258
Pennsylvania, Buffalo district, Ohio, and adjacent plants	27,853,895	25,665,154
Alabama and Tennessee	4,899,826	4,440,458
Illinois, Indiana, Michigan, and Missouri	13,517,600	11,979,051
Northwest and Far West	2,237,604	2,012,104
<b>Total</b>	<b>53,475,481</b>	<b>48,313,025</b>
<b>Beehive coke—</b>		
Pennsylvania, Ohio, and West Virginia	5,385,100	3,908,187
Georgia, Kentucky, Tennessee, and Virginia	377,300	393,572
Colorado, Utah, and Washington	252,600	191,044
<b>Total</b>	<b>6,015,000</b>	<b>4,492,803</b>

The chief cause of the increase in coke production in 1929 was the greater activity of iron blast furnaces, the output of pig iron being increased by 11.8 per cent above the 1928 level. In 1929, 47 plants connected with iron furnaces produced 41,549,000 tons of coke, or 77.7 per cent of the total by-product output. The remaining 40 non-furnace plants produced 11,926,000 tons, or 22.3 per cent of the total. The by-product ovens contributed 89.9 per cent of the total output, as compared with 72.5 per cent in 1913, the beehive ovens contributed 10.1 per cent, as compared with 27.9 per cent in 1913. With the addition of 261 new ovens during the year the potential coking capacity of by-product plants was estimated at 59,000,000 net tons, with an increase in 1930 to

a potential capacity of 62,000,000 net tons through the construction of 408 additional ovens.

Allowing for imports and exports and for changes in producers' stocks, the indicated consumption of coke in 1929 was 57,812,000 tons. Of this amount, approximately 44,226,000 tons was consumed by blast furnaces in the manufacture of pig iron and ferro-alloys. The remaining 13,586,000 tons was used in foundries in smelting non-ferrous metals, in the manufacture of water gas, in miscellaneous other industrial uses, and for domestic heating.

**COLE, MAJ GEN ELI KELLEY** Officer in the United States Marine Corps, died in San Francisco, Calif., July 4, 1929. He was born in Carmel, N. Y., Sept. 1, 1867, and was graduated from the U. S. Naval Academy in 1888. Commissioned second lieutenant in the United States Marine Corps, July 1, 1890, he rose through the successive grades until made major general, June 3, 1924. He first commanded the Marine Barracks in Puget Sound, 1899-1901. From 1902 to 1910, Cole served alternately in the Philippines and in Panama, being returned to the United States for short periods. During 1911-14 he was attached to the office of the major general commandant of the Marine Corps of the Navy Department and in 1915 he commanded the Marine Barracks at Annapolis, Md. He was in Haiti, 1915-16, commanding the First Provisional Brigade of the Marines, for which service he was given the Navy Cross. In 1918 he was sent to France where he commanded the 5th Brigade of the U. S. Marines of the A. E. F., the first depot division of the 41st Division, and the American Embarkation Centre of the A. E. F. For this work, he was decorated with the Croix de Guerre and the American Distinguished Service Medal. On returning to America, he successively commanded Marine Barracks in Pennsylvania, South Carolina, and Virginia. After July 2, 1927, he was acting major general of the Department of the Pacific with headquarters at San Francisco.

**COLGATE UNIVERSITY.** A nonsectarian institution for the higher education of men in Hamilton, N. Y., founded in 1819. In the autumn of 1929, there were 985 students enrolled. By vote of the board of trustees, the enrollment has been limited to 1000 students, the freshman class of 320 men was selected from a list of approximately 450 applicants. The faculty numbered 78 members. The productive funds amounted to approximately \$4,250,000, and the income for the year was approximately \$410,000. The library contained 110,000 volumes. A new chemistry building, costing \$450,000, was under construction in 1929. The building formerly used as a chemical laboratory was to be remodeled for use by the department of physics. President, George Barton Cutten, Ph. D., D. D., LL. D.

**COLLEGES.** See UNIVERSITIES AND COLLEGES.  
**COLOMBIA.** A republic in the northwestern part of South America, third in population and fourth in size among the countries of that continent. Capital Bogotá.

**AREA AND POPULATION.** The area of Colombia is given at 440,846 square miles and the population according to the census of Oct. 14, 1918, 5,855,077; estimated in 1928 at 8,000,000. The total population was distributed as follows: whites 20 per cent; Negroes, 5 per cent; Indians, 7 per cent; mulattoes, 18 per cent; mestizos, 50 per cent. The net gain from immigration in 1926

was only 3048. The capital, Bogotá, had a population in 1918 of 143,944, and estimated in October, 1923, at 166,148. The country is divided into 14 departments, 3 intendencies, and 6 commissionerships. Other important towns with their populations in 1918 are Barranquilla, 64,543, estimated in 1923, 81,330; Medellín, 79,146, estimated in 1923, 86,641; Cartagena, 51,382; estimated in 1923, 68,119; Cali, 45,825, estimated in 1923, 68,777, and Manizales 43,203, estimated in 1923, 51,838. Manizales, which was destroyed by fire in 1925, has been rebuilt. By virtue of a law of Aug. 11, 1928, the taking of a general census of the Republic was authorized.

**EDUCATION.** In 1927 there were 7531 primary and secondary schools in Colombia, with 449,111 registered pupils, 25 industrial schools, with 1392 students, and 6 art schools with 399 students. There were also 17 normal schools with 987 students. The oldest university is that at Bogotá (founded in 1572). This and the school of mines at Medellín are national institutions. The other universities are departmental.

**PRODUCTION, MINERAL RESOURCES, ETC.** Notwithstanding the increasing importance of petroleum production within the past few years, Colombia continues to be primarily an agricultural country. Coffee is the chief crop, amounting to 22 per cent of the total agricultural production. In coffee production, Colombia is exceeded only by Brazil. Favorable coffee prices and a good crop are quickly reflected in an active market and increased imports. Coffee production, in fact, is considered the most reliable national barometer. Prior to the World War, coffee represented but little more than 50 per cent of the total exports. By 1926 it constituted 80 per cent of all exports, but in 1928 the ratio dropped to 60 per cent. The United States takes about 90 per cent of the total coffee shipments.

Colombia was unusually prosperous in 1925, 1926, and 1927, but toward the latter part of 1927 a downward trend was noticeable. The year 1928, however, was one of unusual prosperity and stimulated the real estate speculation and inflation apparent since 1926. In 1928 signs of anxiety developed in the retail trade and wages rose to unprecedented levels due to the number of workers drawn from the coffee plantations to the oil fields and public works. The cost of living climbed steadily.

A succession of serious labor troubles in the districts hampered economic progress of banana-plantation laborers in 1928 causing a loss estimated at \$1,000,000. Business took a downward trend at the beginning of 1929 and in July the country was in the grip of a general depression with the credit situation serious. The exceptionally favorable conditions of the years 1925-28 inclusive were due primarily to excellent coffee crops marketed at high prices, and secondarily to the exploitation and exportation of petroleum, commencing with the opening of a pipe line from oil fields at Barranca Bermeja to the seaport of Cartagena in the summer of 1926. The depression of 1929 was attributed to the drop in the price of Colombian coffee on the New York market, the curtailment of public works, with the discharge of thousands of laborers, and the high cost of living.

The total value of agricultural products in 1927-28 was estimated at 628,000,000 gold pesos (1 gold peso equals \$0.97), of which maize represented 160,000,000, coffee 90,000,000, and cattle

56,000,000. Exports of coffee in 1928 totaled 2,795,000 bags (of 62½ kilos each), or 266,000 bags more than in 1927. Cotton production in the same year was 14,000,000 pounds. Cocoa, sugar, vegetable ivory, dyewoods, wheat, plantains, and rubber are other products.

Colombia is rich in minerals. Gold is found in nearly all the departments, the exports in 1927 totaling \$2,000,000. Other minerals more or less worked are copper, lead, mercury, cinnabar, manganese, emeralds, and platinum. Colombia produces one-half of the world's output of platinum, the remainder coming from Russia. Exports in 1927 were valued at \$3,500,000. The Government operates the entrance mines which produce 90 per cent of the world's supply, and controls the salt monopoly. Although only producing oil a comparatively short time, Colombia is already considered an important factor in making estimates of future world production. The completion of the work of looping the pipe line from the oil fields to the port of Cartagena increased the capacity of the line from 30,000 to 50,000 barrels per day. The production of crude oil in 1928 totaled 19,896,797 barrels (of 42 gallons), as compared with 15,014,474 barrels in 1927. Exports of crude oil were 18,101,435 barrels in 1928, valued at \$22,000,000, and 13,679,317 barrels in 1927. Coal mining is carried on almost exclusively in the Cali district, where production is estimated at about 100,000,000 tons annually. The extensive coal and iron deposits are largely undeveloped.

**COMMERCE.** The total value of all exports in 1928 was \$116,602,745, of which \$94,500,000 went to the United States. The coffee exports in 1927, 151,730,000 kilos, valued at \$79,808,000, bananas, 196,624,000 kilos, valued at \$5,587,000, hides and skins, 7,229,000 kilos, valued at \$2,638,000. The platinum exported was valued at \$4,602,000. The value of 1928 imports, \$126,229,150. The United States supplied 43 per cent of 1927 imports, the United Kingdom, 15.4 per cent, and Germany, 12.7 per cent. Exports in 1928 totaled \$108,365,926 and imports \$107,369,910. Exports of crude petroleum in 1928 totaled 18,101,435 gallons, as compared with 13,679,317 barrels in 1927. Coffee exports totaled 2,795,000 bags in 1928 and 2,529,000 bags in 1927, the average price received on the New York market in 1928 being \$0.263 and in 1927, \$0.260. Colombian exports to the United States, amounting to about three-fourths of the total exports, increased slightly in 1928 owing to the higher coffee prices, and imports from the United States showed a decided increase over imports for the previous year. In 1929 imports from the United States fell below the 1928 level, but exports to that country continued to increase although retarded by low coffee prices. Besides petroleum and coffee, other leading exports in 1927 were cattle hides, \$3,076,672, bananas, \$5,310,961, alligator skins, gold bars, cotton, balsam, balafá, rubber, toquilla straw, cottonseed, leaf tobacco, ivory nuts, emeralds, and Panama hats. Exports in 1929 were officially estimated at \$120,625,000.

**FINANCE.** Budget estimates for 1929 placed the revenue at 65,658,668 gold pesos and expenditures at 80,097,804 gold pesos (par value of peso is \$0.97). The 1928 budget provided for revenues of 51,944,056 gold pesos and expenditures of 45,168,061 gold pesos, the main items of estimated ordinary expenditure being government, 9,197,017 pesos, finance, 7,004,340 pesos, war, 6,927,293 pesos, public instruction and

health, 5,354,579 pesos, posts and telegraphs, 5,757,639 pesos. Main items of estimated revenue in 1928 were national properties, 8,385,418 pesos; national services, 2,585,261 pesos, taxes, 32,168,548 pesos, new revenues, 5,050,000 pesos. Extraordinary expenditures in 1928 were placed at 30,785,996 gold pesos.

Actual revenues in 1928 amounted to 80,000,000 pesos, or about 18,000,000 pesos more than in 1927, according to the Colombia press. Revenues were greater than the budget estimates during the first quarter of 1929, but in May the Government found it necessary to economize and the budget was reduced by about 9,000,000 pesos. In November, the Minister of Finance informed the Senate that there was no money in the Treasury and the year ended with a deficit. Preliminary figures for the 1930 budget estimated revenues at 62,000,000 pesos (about \$80,140,000) and expenditures at 53,000,000 pesos (about \$51,110,000), which would leave a surplus of 9,000,000 pesos to be applied on the 1929 deficit. This represented a proposed reduction of nearly \$30,000,000 in expenditures, the principal cuts being made in appropriations for the ministries of Public Works, Education, and War. The national debt on Dec 31, 1929, was approximately \$4,456,000, of which \$72,770,171 was held abroad.

In the four years preceding 1929, Colombia spent more than \$100,000,000 on railway and other construction and the departmental governments another \$50,000,000. Foreign loans floated by Colombia up to June 30, 1929, totaled 248,075,797 pesos, of which 94,948,852 was for the national Government, 69,914,250 for the departments, 26,221,725 for the municipalities, and 56,991,240 for the banks. The bonds outstanding on the same date amounted to 223,029,746 pesos. From 1923 to 1926, the total debt of Colombia was cut almost in half, but from the end of 1926 to the end of 1928 the external public debt increased by about \$58,000,000. A law passed on June 5, 1928, limited the borrowing capacity of departments and municipalities. The balance of the Bank of the Republic, on June 20, 1929, showed a decrease in the gold reserve of 7,110,866 pesos and an increase in rediscounts, as compared with the balance on the same date, 1928. Note circulation fell from 50,977,000 pesos on June 30, 1928, to 48,656,000 pesos a year later.

The mission of American financial experts engaged by the Ministry of Finance ended its work Aug. 25, 1929. It recommended the organization of a Bureau of the Budget, and the reorganization of the financial operations of the national Government and its administrative units.

COMMUNICATIONS. In 1928 there were 1750 miles of railway in Colombia, 11 of the 14 lines being state owned and the remainder British owned. A 521-mile stretch of railroad to serve the Western section of the Republic is under construction between Bolombolo and Canadistula. In 1929 contracts were let for the construction of lines between Ibaguë and Armenia and between Velez and the Magdalena. The first will make possible direct railway communication between the capital and the Pacific and the second will connect eastern Colombia with the Magdalena River. Motor roads in use in 1928 totaled 2340 miles. A highway between Ibaguë and Armenia was opened in 1929, making it possible to reach Bogotá through the Pacific port of Buenaventura in three days by train and automobile. The former shortest route was from the Caribbean

coast and required nine days by boat and train. Improvement of the Magdalena River, which is the country's main traffic route, was being carried on. River transportation, without transshipment, was to be provided by a new company. The river ports and the port of Barranquilla on the Atlantic coast were badly congested during 1928 and this fact, with the high transportation charges, vitally affected the economic situation. In 1926, 2362 vessels of 2,849,366 gross tons entered Colombian ports and 2074 vessels of 1,895,140 gross tons cleared. Airplane lines connect Barranquilla, Buenaventura, and other cities. In 1929 a new all-service line was opened to Colon, Panama.

GOVERNMENT. The executive power is vested in a president elected for four years by direct popular vote, and the legislative power in a congress of two houses: the senate of 34 members, elected indirectly for four years, and the house of representatives with 92 members, elected by direct popular vote for two years. President in 1929, Dr. Miguel Abadía Méndez, elected Feb. 14, 1926, for the term 1926-30.

HISTORY. Internal politics were unusually turbulent during 1929, due in large measure to preparations for a presidential election, and in consequence Congress adjourned November 17 without acting upon a number of important bills. Chief among these were the proposed new oil law; the appropriations bill, measures for the reorganization of the National Council of Communications, the administration of the National Railways, and the establishment of a fiscal agency, the customs tariff, and the agrarian credits bill. The failure to pass the appropriations bill left the Government with the same budget as in 1929, although the business depression indicated that the revenues would show a considerable decrease.

President Abadía Méndez on November 19 appointed an advisory board to assist the Ministers of Finance and Public Works in dealing with their problems left unsolved by Congress. The advisory council submitted a new budget with reduced expenditures. The failure of the oil bill left foreign oil companies subject to the emergency oil law of 1927, protests against the law having been overruled by a decision of the Supreme Court in 1929. The cancellation, under the emergency law, of an oil concession held by an American company led to the diplomatic intervention of the United States in 1928. Because of the change in government in 1930, observers considered it improbable that legislation to replace the emergency law would be enacted before 1931.

In June, the dismissal of the Mayor of Bogotá by the national Government led to a boycott of Bogotá tramways, a student strike, and a huge street demonstration, which was charged by mounted police. Many were trampled upon and a student was killed. The mayor's dismissal followed his removal of the managers of the municipal aqueduct and tramways, one of whom was the brother-in-law of President Abadía Méndez. The latter was obliged to reorganize the Cabinet and the provincial and municipal administrations to prevent further demonstrations. Ignacio Rengifo, Minister of War, and Arturo Hernández, Minister of Public Works, resigned from the Cabinet, being succeeded by Premier Gabriel Rodríguez Diago (provisionally) and Rafael Escalón, respectively.

The Abadía Méndez administration came in for violent criticism during the sessions of Congress in October. The Lower House, after debating for a week, appointed a committee to discover whether there were sufficient grounds for the House to impeach the President before the Senate. The specific complaint was that the President had violated the constitution by declaring martial law during labor troubles in the banana zone in 1928. The committee, on November 14, reported that there were no grounds for such action. These maneuvers were carried on in the face of appeals from Archbishop Perdomo, Primate of Colombia, and the two Presidential candidates, General Vasquez Cobo, and Dr. Guillermo Valencia, to cease political agitation and pass urgently needed legislation. Both candidates were Conservatives. The Liberals having presented no candidate. The Liberals had abstained from voting since 1921 because of alleged election frauds, but agreed to participate in the 1930 election following the adoption of a law requiring every voter to present a certificate of identification.

Colombia's relations with the United States were injected into the campaign, Senor Valencia advocating more cordial relations with the northern republic in view of the increasingly close ties in trade and communications between the two countries.

His attitude was severely censured by former President Coneha, then in Rome, who was influential in the Conservative party. The abolition of the death penalty was also an outstanding issue in the campaign.

In the elections for Congress held on May 6, the Conservatives, as was expected, won a majority of seats over their Liberal opponents. Disorders attributed to Communist propaganda occurred in the Province of Santander during July. Troops and police quelled the disturbance and arrested a number of leaders. Critics of the government attributed the revolt to unendurable labor conditions in the district.

On November 15, Congress ratified a treaty settling the only remaining boundary dispute between Colombia and Brazil through reciprocal free navigation of the Amazon, Caqueta, and Putumayo rivers. Liberal members of Congress opposed the treaty.

**COLORADO. POPULATION.** According to the Fourteenth Census, the population of the State on Jan 1, 1920, was 939,629. The estimated population on July 1, 1928, was 1,090,000. The capital is Denver.

**AGRICULTURE.** The following table gives the acreage, production, and value of the principal crops in 1928 and 1929.

Crop	Year	Acreage	Prod Bu	Value
Hay	1929	1,590,000	3,103,000 *	\$35,174,000
	1928	1,583,000	2,805,000 *	\$2,345,000
	1928	1,397,000	18,912,000	16,691,000
Wheat	1929	1,389,000	18,564,000	15,815,000
	1929	240,000	2,880,000 *	
	1928	179,000	2,394,000 *	16,687,000
Corn	1929	1,366,000	23,222,000	17,416,000
	1928	1,438,000	18,694,000	12,712,000
	1929	88,000	12,330,000	18,552,000

	1929	212,000	6,672,000	3,155,000
Oats ...	1928	193,000	5,988,000	2,692,000

\* Tons

**MINERAL PRODUCTION.** The coal production of the State, which contributes somewhat less than one-half of the entire annual value of its mineral industry, on the basis of recent years, was maintained in 1928 at about the same degree of activity as in 1927. There were produced in 1928, 9,847,707 short tons of coal, in 1927, 9,724,075. The production of 1928 attained the value of \$27,613,000, that of 1927 reached \$27,044,000, as against \$29,529,000 for 1926. The production of gold recovered only in small part from the sharp fall of 1927, the production of 1928 being \$5,304,876 and that of 1927, \$5,279,118 in value. The placer operations were reported to have contributed \$61,406 of the gold production of 1928. The silver produced attained 4,052,253 fine ounces, in value \$2,370,558 for 1928, for 1927, 3,784,005 fine ounces, or \$2,145,871. Copper was produced to the value of \$1,237,829 in 1928, a considerable gain over the \$742,846 of 1927. The lead production fell off, being 53,501,723 pounds for 1928, as against 66,772,557 for 1927; in value, \$3,103,100 for 1928 and \$4,206,671 for 1927. Zinc production, 71,462,000 pounds for 1928, was little changed from that of 71,729,000 pounds for 1927; the value, however, was lower, being \$4,359,182 for 1928, as against \$4,590,076 for 1927. The combined value of the product of the five metals was \$16,375,355 for 1928, for 1927, \$16,965,172. Petroleum production was about the same in quantity, 2,722,000 barrels for 1928, as against 2,831,000 for 1927, the value was lower, being \$2,400,000 for 1928 (estimated) to \$3,400,000 for 1927. Clay products for 1927, the latest reported year, attained \$2,998,486, but fell short of the \$3,381,776 of 1926, as well as of the value for 1925. The total mineral product of the State attained for 1927 the value of \$58,855,203, for 1926, \$65,597,487.

The estimated output of gold, silver, copper, lead, and zinc from Colorado mines in 1929 in terms of recovered and estimated recoverable metal was 211,381 fine ounces of gold, 4,323,387 ounces of silver, 8,352,000 pounds of copper, 49,751,000 pounds of lead, and 59,312,000 pounds of zinc, according to the U S Bureau of Mines. These figures are to be compared with 256,623 fine ounces of gold, 4,052,253 ounces of silver, 8,504,646 pounds of copper, 53,501,723 pounds of lead, and 71,462,000 pounds of zinc in 1928. Compared with 1928 figures, gold shows a decrease of \$935,244, silver an increase of 271,134 ounces, copper a decrease of 242,646 pounds, lead a decrease of 3,750,723 pounds, and zinc a decrease of 12,150,000 pounds. The gross estimated value of the output of metals in Colorado in 1929 is gold, \$4,369,632, silver, \$2,308,689, copper, \$1,495,009, lead, \$3,159,189, zinc, \$3,944,248, or a total of \$15,276,766, compared with \$16,375,355 in 1928.

The Cripple Creek district in 1929 produced \$2,595,928 in gold, as compared with \$3,059,181 in 1928. This decrease is approximately equal to the 1928 output of the Portland-Independence cyanidation-concentration mill at Victor, closed Dec 1, 1928.

**FINANCE.** State expenditures in the year ended Nov. 30, 1928, as reported by the U. S. Department of Commerce, were for maintenance and operation of governmental departments, \$11,519,392 (of which \$538,110 was for local education), for interest on debt, \$557,468, for permanent improvements, \$5,454,989; total, \$17,631,849 (of which \$7,067,639 was for highways, \$2,148,055

being for maintenance and \$4,919,584 for construction). Revenues were \$18,808,280. Of these, property and special taxes furnished 37.9 per cent, departmental earnings and remuneration for officers' services, 11.2, license sales, 33.3 (including gasoline taxation of \$4,118,399). The State debt, \$10,124,206 net of sinking funds, included \$8,200,000 for highways. Property valuation was \$1,577,500,380, State taxation thereon, \$5,616,114.

**TRANSPORTATION** The total number of miles of railroad line under operation on Jan. 1, 1929, was 4982.82. There were built, in 1929, 5.25 miles of additional first track.

**MANUFACTURES.** According to the Federal biennial Census of Manufactures published by the U. S. Department of Commerce in 1929 and dealing with the operations of 1927, there were in the State, in 1927, 1483 manufacturing establishments. These employed 32,001 wage earners, whose wages for the year totaled \$43,193,765. Materials and supplies used in production cost \$173,277,399. Manufactured products attained the combined value of \$278,221,431.

**POLITICAL AND OTHER EVENTS** Permission was granted to the Denver & Salt Lake Railroad by the Interstate Commerce Commission on April 23 to build the projected line known as the Dotsero Cutoff, for the purpose of connecting Denver with Salt Lake by a short line utilizing the Moffat Tunnel. It was provided that the Denver & Rio Grande Western be permitted to operate through the tunnel. The fact that the payment of assessments upon property owners in the tunnel district was causing widespread hardship and that, under the existing lease, the railroad had to pay interest on two-thirds of but a portion of the bonds issued by the tunnel commission for construction afforded occasion for a move on the commission's part to demand higher payments of the railroad. The railroad applied for an injunction in the Federal District Court at Denver and the validity of the existing lease was sustained by a decision rendered September 20.

**EDUCATION** A general effort was made in the public schools in 1929 to concentrate the teaching effort on the development of character. To this end, the State Department of Education, as reported in the *Journal of the National Education Association*, gave out appropriate slogans for each county and formulated an outline of work. There were reported in the 63 counties of the State in 1928, 2032 school districts and 3183 schoolhouses in use. The number of children of school age (reckoned to be from 1 to 21 years) was estimated at 303,481. There were enrolled in the public schools 303,481 pupils and the number of teachers employed was 9647. Teachers' salaries ranged from \$179.23 a month for men and \$133.55 for women in high schools to \$106 for men and \$99.58 for women in one-teacher schools. The total expenditure of the year for public schools was \$25,410,608.

**CHARITIES AND CORRECTIONS** The State Department of Charities and Corrections consisted only of the Governor, as head, and a skeletal organization, concerned largely with applications for pardons and paroles, which lay within the sole disposal of the Governor, a former Pardon Board having been abolished. The correctional institutions and the insane hospital were directed by a single body, the Colorado Board of Corrections, composed of three members ap-

pointed under the civil service system. Eleemosynary institutions were under other boards. Among the institutions were State Penitentiary, Canon City; Reformatory, Buena Vista, State Hospital for the Insane, Pueblo, Homes for Mental Defectives, at Ridge and at Grand Junction, State Industrial School for Boys, Golden, State Industrial School for Girls, Denver, State Home for Dependent and Neglected Children, Denver. The penitentiary had, on November 30, 1108 inmates, the State hospital, 2890, the State Home for Dependent and Neglected Children, 198.

**LEGISLATION** The State Legislature convened on January 2 in its twenty-seventh biennial session, and adjourned on April 25. It changed the fiscal year of the State government to begin with July 1 and made necessary adjustment of the financial system of the State to the change. The proposal to call a constitutional convention was referred to popular vote. Jurisdiction over the Rocky Mountain National Park was ceded by the State to the Federal Government. A bill providing longer terms of imprisonment for the habitual criminals, somewhat after the model of the statutes of New York and several other States, was enacted, though weakened by amendments eliminating from the provisions of the act certain of the more common crimes. An enactment known as the Range Bill regulated the subjects that had caused long and bitter dispute between cattlemen and sheep owners over their respective claims to use of the open range for stock. Appropriations for the ensuing two years were made to the total of \$7,890,743. An increase of the salary of the governor to \$10,000 a year, from \$5000, and pay increases to the justices of the State Supreme Court were both vetoed by Governor Adams.

A measure for the control of predatory animals had attached to it a special tax levy on livestock. Life insurance policies in which another than the estate or the administrator of the estate of the deceased was named as beneficiary were exempted from the State inheritance tax. Debt incurred by the State in dealing with the coal strike of 1928 was validated by statute.

Former Judge Ben B. Lindsey, leader in the Colorado movement for the better control of juvenile offenders and nationally known as the advocate of companionate marriage, was disbarred from the practice of law in the courts of the State, by the order of the State Supreme Court, rendered on December 9. The charge leading to this action was that while on the bench Judge Lindsey had accepted money from Mrs. Helen Elwood Stokes for services rendered in her contest of the will of her former husband. The action against Lindsey was subsequent to a long conflict between him and his political opponents. The State penitentiary at Canon City was the scene, in the opening days of October, of one of the several sanguinary prison mutinies that marked the year in the United States. The mutineers seized a number of prison guards and used them as hostages in a demand for safe conduct to liberty. Their demand was refused and the mutineers were besieged and finally overcome on October 4. Four guards held as hostages were killed, as well as three other guards and five convicts. Colorado signed, with New Mexico and Texas, on February 12, a compact to maintain distribution of the waters of the Rio Grande River on the existing basis provisionally until 1935, when it was hoped that a permanent agree-

ment would have been attained. Construction on a \$5,000,000 city hall at Denver proceeded, with some delay due to the non-delivery of structural steel. The discovery of a turquoise field in the southern San Luis Valley was reported in April.

**OFFICERS** Governor, William H. Adams, Lieutenant-Governor, George M. Coilett, Secretary of State, Charles M. Armstrong, Treasurer, William D. MacGinnies, Auditor, Joseph P. Jackson, Attorney-General, Robert E. Winborn, Superintendent of Public Instruction, Katherine L. Craig.

**JUDICIARY** Supreme Court, Chief Justice, Greeley W. Whitford, Associate Justices, Haslett P. Burke, John Campbell, John H. Denison, John T. Adams, Charles C. Butler, Julian H. Moore.

**COLORADO, UNIVERSITY OF** A coeducational, State institution of higher learning in Boulder, Colo., founded in 1876. The number of students enrolled for the autumn of 1929 was 2983, the summer session enrollment was 3081. There were 288 faculty members, exclusive of assistants. The total income for general maintenance from State tax fees, tuition, etc., was estimated at \$1,611,590, while \$420,729 was received for the operation of hospitals, including fees, and \$37,692 for new buildings. The library contained 209,076 volumes, 17,600 pamphlets, and 2550 maps. The gift of \$2000 annually was received by the Denison Memorial (Medical) Library from the Denison Foundation. President, George Norlin, Ph.D., LL.D.

**COLORED METHODISTS** See METHODISTS, COLORED.

**COLUMBIA UNIVERSITY** A nonsectarian institution for the higher education of men and women in New York City, founded in 1754. At Morningside Heights, Broadway and 116th Street, are located Columbia College (for undergraduate men), Barnard College (for undergraduate women), Teachers College, including the departments of education and practical arts, the professional schools of law, engineering, architecture, journalism, business, library service, and optometry, and the non-professional graduate faculties of political science, philosophy, and pure science. The College of Physicians and Surgeons and the School of Dental and Oral Surgery are on West 168th Street, the College of Pharmacy on West 68th Street, Seth Low Junior College in Brooklyn, N. Y., and St. Stephen's College at Manhattanville-Hudson, N. Y. In addition, through university extension classes and the summer session, courses are offered for resident students at Morningside Heights, and other courses are offered at Camp Columbia, as well as at several extramural centers.

On the basis of the enrollment on Nov. 1, 1929, the total number of resident students for the year was estimated at 37,898, distributed as follows: Undergraduates, 3715, of whom 1950 were in Columbia College, 1100 in Barnard College, 390 in Seth Low Junior College, 135 in St. Stephen's College, and 140 in other schools. Graduate and professional students, as follows: Graduate faculties, 3080; law, 600, medicine, 434, engineering, 221, architecture, 109, journalism, 177, business, 472, dental and oral surgery, 279; pharmacy, 800, optometry, 23, library service, 240; Teachers College, 6620. University classes, 10,006, unclassified, 305. Of 13,700 non-

resident students, 10,800 were registered in home-study courses and 2900 in special and extramural courses. There were 13,817 students registered for the summer session of 1929. The grand total is exclusive of 300 duplicate registrations.

The faculty and officers of administration in 1929 numbered 2785, of whom all but 37 were in active service. This number was distributed as follows: Professors, 319; associate professors, 123, assistant professors, 220, associates, 97, instructors, 383, lecturers, 73, assistants, 207, curators, 3, associates, instructors, lecturers, and assistants in Teachers College, 216, instructors and lecturers in the College of Pharmacy, 25, instructors in extension and home study, not included above, 503, instructors in summer session, not included above, 516, officers of administration, 63.

Among the professorial appointees for the year 1929-30 were Elliott E. Cheatham (law), Armin K. Lobeck (geology), Thomas Thornton Read (mining engineering), Robert P. Hamilton, Jr. (law), Eric Randolph Jette (metallurgy), J. Thomas Hopkins (education), Claus W. Jungblut (bacteriology), Grayson N. Kefauver (education), Ewing C. McBeath (dentistry), Lois H. Meek (education), William R. Torgerson (tropical medicine), Leon A. Tulin (law), Clifford L. Brownell (physical education), Philip B. Buckley (mining), Hans Smetana (pathology), Douglas M. Whitaker (zoology), Oscar Wintersteiner (biological chemistry), Eleanor M. Whitmer (education), and Carl Garabedian (mathematics, St. Stephen's College). The visiting professors appointed for the year 1929-30 were Samuel Angus of the University of Sydney, Thomas E. Beiner, former chancellor of the University of Porto Rico, Ellwood P. Cubberley of Stanford University, Miles A. Dressel of State Teachers College, San José, Calif., Alfons Hlilka of the University of Göttingen, Ernest Horn of the University of Iowa, Vittorio Marchioni of the University of Naples, Antoine Meillet of the Collège de France, E. Allison Peers of the University of Liverpool, Giuseppe Piezolini, Italian representative of the Bureau of Intellectual Cooperation of the League of Nations, and Henry Suzzallo, former president of the University of Washington.

Important events of the year 1928-29 included the dedication of the new Medical Center, the opening of the Casa Italiana and of the Deutsches Haus, the establishment of the university medal, the dispatch of an anatomical expedition to Central Africa, the celebration of the one hundredth anniversary of the founding of the College of Pharmacy, the affiliation of Greenwich Settlement House with the university, the reorganization of the department of Romance languages, the change in title of the faculty of applied sciences to that of the faculty of engineering, with revision of the curriculum in the school of engineering, the conference of major industries, and the religious conference of representatives of the Jewish, Roman Catholic, and Protestant churches.

The one hundred and seventy-fifth anniversary of the founding of the university was celebrated during the week ending October 31. By gifts from many sources, the committee in charge financed the painting of 47 portraits, 27 of which were of officers and alumni identified with Columbia in the eighteenth and nineteenth centuries. On this occasion, the university medal, established by the trustees to reward outstanding achievement by

Columbia alumni, was awarded for the first time to 47 graduates of foreign birth who had returned to conspicuous public service in their native countries; honorary degrees were bestowed on 49 distinguished alumni and 74 members of the faculties

On November 4, the trustees announced nine new professorships named in honor of scholars who had contributed to the building of the university, the Moore Professorship of Philosophy, named in honor of Presidents Benjamin Moore and Nathaniel F. Moore and held by Prof. J. J. Coss, the Stevens Professorship of Mechanical Engineering, named for John Stevens and held by Prof. I. Lucke, the Hosack Professorship in the Faculty of Medicine, in memory of David Hosack and held by Prof. C. C. Lieb, the Renwick Professorship of Civil Engineering named for James Renwick and held by Prof. I. K. Finch, the Da Ponte Professorship of Italian, commemorating Lorenzo Da Ponte and held by Prof. D. Bigongiari, the Newberry Professorship of Geology, in memory of John S. Newberry and held by Prof. C. P. Berkey, the Vinton Professorship of Mining Engineering, in memory of Francis E. Vinton and held by Prof. T. T. Read, the Brander Matthews Professorship of Dramatic Literature, held by Prof. G. C. D. Odell, and the Burgess Professorship in the Faculty of Political Science, in honor of John W. Burgess and held by Prof. L. Rogers

The capital endowment in 1929, excluding value of plant (including Barnard College, Teachers College, College of Pharmacy, and St. Stephen's College), was \$73,543,073, the estimated total resources, as of June 30, 1929 (including Barnard College, Teachers College, and the College of Pharmacy), were \$131,088,851, and the annual budget for 1929-30 (including Barnard College, Teachers College, College of Pharmacy, and St. Stephen's College) was \$15,703,074. During 1928-29 the university received gifts in money representing a total of \$3,617,928. The principal additions to general endowment were payment made on account on estates still in course of administration. The chief additions to special endowments were the gift by Mrs. Nathan J. Miller of \$250,000 to establish the Miller Endowment Fund to maintain a chain of Jewish history, literature, and institutions, and various large gifts to the endowment fund of the School of Dental and Oral Surgery, including \$30,000 from Dr. Henry W. Gillett. In addition, \$525,000 was received from Edward S. Harkness for the purchase of a site for a residence hall for the medical school and an anonymous gift of \$175,000 toward the cost of erecting this hall. Gifts to income totaled \$1,044,354. The library contained 1,166,600 volumes. President, Nicholas Murray Butler, Ph.D., Hon.D., LL.D., Litt.D.

**CONGO, BELGIAN.** A Belgian colony in Central Africa, formerly the Congo Free State, which was annexed to Belgium in 1908. The boundaries were defined by declarations of August, 1885, and December, 1894, and by treaties with Germany, France, Great Britain, and Portugal. Area, estimated at 918,000 square miles, the native population is placed at 8,500,000 (Bantu). On Jan. 1, 1928, the white population numbered 20,702, of whom 14,147 were Belgians. The chief city and former capital is Boma, by a royal decree of 1923, the capital was transferred to Kinshasha, which was renamed Leopoldville. Other important towns are Elizabethville, Stanleyville, and Kookilhatville. Catholic and Protestant bodies carry on missionary work, the number of Catholic missionaries in 1927 being 1181 and of Protestant, 592. In co-operation with the Government, they supply means of education, and there are several educational institutions under direct government control, at the more important towns. In 1928 the government grant for education to the missionaries amounted to 9,184,600 francs, while the total expenditure on education was 23,428,434 francs.

**COMMERCE, FINANCE, ETC.** Total imports for consumption during 1927 reached 649,585 metric tons valued at \$41,599,000, as compared with 631,584 tons valued at \$42,158,000 for the preceding year. Exports rose from 203,678 metric tons valued at \$23,775,000 in 1926 to 223,266 tons valued at \$29,336,000 in 1927.

The budget for 1928 provided revenues of 521,563,585 francs and expenditures of 521,241,955 francs. The debt on Dec. 31, 1927, was 1,893,050,983 francs, of which 1,770,411,383 francs were consolidated debt and 122,639,600 francs floating debt. Steamers belonging to the Government ply on the Congo in its navigable section from its mouth to Matadi, a distance of 95 miles, and government and private companies supply a transport service on the upper Congo and its tributaries. There are over 1000 miles of navigable water between Stanley Pool and Stanley Falls, and above Stanley Falls there is another section navigable for about 585 miles. On Jan. 1, 1928 there were 2187 miles of railroad open to traffic and 9375 miles of road partly suitable for motor traffic. The extension of the Beignuela Railway to the western Katanga mines was expected to be completed by August, 1930. Copper production of these mines was about 338,626,000 pounds annually and it is estimated that the output will increase to 500,000,000 pounds with the advent of the railroad. A motor road linking the Nile and Congo rivers was completed in 1929, running from Stanleyville on the Congo to Rejaf, the Nile terminus of navigation from Khartum.

Governor-General in 1929, Lieutenant-General Tilkens, appointed Dec. 27, 1927.

**CONGREGATIONALISM.** A religious denomination founded in the United States by the Pilgrims in Plymouth, Mass., in 1620 under the leadership of Brewster, Bradford, and Winslow. The origin of this movement lay in the Separatist activity in England. The Puritans of Massachusetts Bay followed a similar tendency and, as a result, the essential elements of Separatism and Puritanism were combined in Congregation-

alism. In this denomination, each church holds the right to frame its own statement of belief, and the policy of the denomination, as a whole, represents adaptation to conditions rather than accord with a theory of church government. The national council, by which the administrative affairs of the church are carried on, has no ecclesiastical authority, but includes ministerial and lay delegates elected by the State conferences and district associations.

The national council meets biennially, the session in 1929 having been held May 22-June 3 in Detroit, Mich. The principal feature of this meeting was the approval by the council of a plan of union with the Christian Church, which in turn was concurred in by the convention of the Christian Church on Oct. 25, 1929, in Piqua, Ohio. See CHRISTIAN CHURCH. The plan provides that the membership of the National Council of Congregational Churches and the membership of the General Convention of the Christian Church shall constitute the voting membership of the General Council of the Congregational and Christian Churches, in which body the two denominations shall merge such interests as do not require the legal attention of either of the separate bodies, each of which will maintain its existence for necessary separate action for the time being. Provision also is made for the common administration of all benevolent activities, including home and foreign missions, religious education, and the like. Both bodies throughout their histories have been democratic in organization, and the plan of union provides for full local autonomy in the local church and in groups of churches associated together.

Statistics of the denomination for Jan. 1, 1929, showed 5497 churches, 5648 ministers, and a church membership of 939,130. There were 3059 young people's societies, with a membership of 149,887. The Sunday-school enrollment was 727,088. The total raised for all benevolences was \$4,166,952, and the home expenses of the church were \$21,713,328. The national benevolence societies of the denomination include the American Board of Commissioners for Foreign Missions and the Congregational Home Boards, consisting of the following corporations unified in their operations by the election of an identical board of directors for all American Missionary Association, Congregational Home Missionary Society, Congregational Church Building Society, Congregational Board of Ministerial Relief, Congregational Sunday School Extension Society, and the Congregational Publishing Society. The Annuity Fund for Congregational Ministers provides a participating plan of retiring ministers.\*

The American Board of Commissioners for Foreign Missions is the oldest foreign-missionary society in America, having been organized June 29, 1810. On Jan. 1, 1929, there were 17 missions under 12 different flags, the stations connected with these missions numbered 104 and the out-stations, 1525. The missionaries holding life appointments numbered 628 and included 147 ordained men, 67 unordained men, 201 wives, and 213 single women. There were also 90 associates serving for shorter periods, bringing the total number of missionaries up to 718, native workers numbered 5755. Religious services were carried on in 2560 places, the organized churches numbered 809, with 98,841 communicants. The total church constituency numbered 306,020, Sunday schools, 1285; theological seminaries and

training schools, 24, with an attendance of 1351 students; colleges, 11, with 3882 students, secondary schools, 96, and primary and elementary schools, 1149, with a total enrollment of 85,377. There were 27 hospitals and 51 dispensaries, with a staff of 44 physicians and 24 foreign nurses. Total expenditures of the board for the year ending Aug. 31, 1928, were \$2,120,935.

The field of the American Missionary Association included Negroes, Indians, and mountaineers in the South and Southwest, Orientals and Indians in the West, Porto Ricans, Mexicans, and Hawaiians. Statistics of the association show that in 1927-28 there were 200 churches with 10,560 members and 31 schools with an enrollment of 7211 pupils. Expenditures during the same period amounted to \$1,413,782. The Congregational Home Missionary Society with its

Congregational Sunday School Extension Society, organizes schools and churches and assists in the commissioning and support of pastors in four-fifths of the territory of the United States. In the remainder of the country, similar work is done by independent State conferences. In 1928 these societies helped to maintain 684 churches and preaching stations, having a total membership of 38,175, and received 3306 persons into church membership, 462 home missionaries were enrolled. Expenditures amounted to \$519,376 and total receipts, to \$516,761.

The Annuity Fund for Congregational Ministers was reported to have assets totaling \$8,518,489, the membership was 2472, and annuity payments amounted to \$164,070. The Congregational Church Building Society received \$320,951 in 1928 for current use and voted 208 church grants and loans and 37 parsonage loans amounting to \$533,543. The society also paid \$589,902 toward 121 new churches and 39 parsonages, leaving 139 applications for grants, church loans, parsonage loans, etc., which could not be provided for because of lack of funds.

\* United Church Comprises Presbyterian, Methodist, and Congregational churches.

\* Includes reports of London Missionary Society and American Board.

\* Repeated from last Congregational Year Book.

Among the 10 theological seminaries with which the denomination was affiliated were: Chicago Theological Seminary; Yale Divinity School, Hartford School of Religious Pedagogy; Oberlin College, and Pacific University. In addition, there were 41 colleges which have had some historical relation to Congregationalism, although a number of them are now undenominational. The table on page 210, reprinted from the *Congregational Year Book* for 1928, gives statistics of international Congregationalism.

The headquarters of the national council are at 287 Fourth Avenue, New York City. The officers for 1928-30 included Moderator, Dr. Fred B. Smith, New York; Associate Moderator, Franklin Warner, White Plains, N. Y., Secretary, the Rev. Charles E. Burton, and Treasurer, William T. Boulton, both of New York. The Congregational Publishing Society maintains branches at 14 Beacon Street, Boston, and at 19 South LaSalle Street, Chicago.

**MINERAL PRODUCTION.** The native mineral industries of the State, which form but a minor source of its wealth, continued in 1927 to derive the chief part of their yearly product from stone and clay products. Stone production was active in 1927, attaining 2,295,360 short tons, in value \$3,202,040, as against 2,069,920 tons, or \$2,680,849, in 1926. The clay products of 1927 reached the value of \$2,652,640 for 1927, for 1926, of \$3,291,298. Lame production, 53,304 short tons, in value \$608,550 for 1927, fell off to an estimated 48,000 tons, or \$505,000, for 1928. The aggregate value of the State's mineral product for 1927 was \$7,209,100, for the year 1926, it was \$7,695,341.

**FINANCE.** State expenditures in the year ended June 30, 1928, as reported by the United States Department of Commerce, were for maintenance and operation of governmental departments, \$19,319,797 (of which \$1,769,774 was for local education), for interest on debt, \$656,865, for permanent improvements, \$15,537,410, total, \$35,514,072 (of which \$15,753,695 was for highways, \$3,278,168 being for maintenance and \$12,475,527, for construction). Revenues were \$33,796,159. Of these, property and special taxes furnished 27.5 per cent, departmental earnings and remuneration for officers' services, 7.8, license sales, 55.3 per cent (including gasoline taxation of \$3,098,680). The State debt totaled

\$16,291,100, net of sinking funds, it was \$2,522,603. On a property valuation of \$2,656,322,911 were levied State taxes of \$1,859,495.

**TRANSPORTATION.** The total number of miles of railroad line under operation on Jan. 1, 1929, was 968.33. There were built, in 1929, 1.01 miles of additional fourth track.

**MANUFACTURES.** According to the biennial Census of Manufactures published in 1929 by the U. S. Department of Commerce, there were in the State, in 1927, 2877 manufacturing establishments. These employed 240,806 wage earners, whose wages for the year totaled \$304,503,907. Materials and supplies used in manufacture cost \$590,014,077. The manufactured products of the year attained the combined value of \$1,284,738,563.

**EDUCATION.** The policy of the State in public-school education was directed to putting trade and vocational education in closer relation with industries and to increasing the provisions for the training of teachers in the trades and industries. The school population of the State in September, 1928, was estimated to be 380,662. There were enrolled in the public schools, in the academic year 1928-29, 310,445 pupils, of whom 264,031 were in elementary, and 45,514 in high school, grades. Current expenditures of the year for public schools in the State were \$26,878,079. The salaries of teachers averaged \$1698.

**CHARITIES AND CORRECTIONS.** The chief central body in 1929 with regard to the control of institutions for the care or custody of persons was the Department of Public Welfare, created in 1921, with a statutory board of five 4-year appointees. The department chief executive officers were a secretary and a commissioner of child welfare. It included boards of child welfare and of adult welfare. Operating separately were boards for education of the blind, for pardons, and the State Tuberculosis Commission. The department was charged with supervision of penal and reformatory institutions, those for the insane, the feeble-minded, and epileptics, public hospitals, State tuberculosis sanatoria, almshouses, homes for the aged, and institutions for child care. The State institutions and their populations of June 30, 1928, were: State Hospital (insane), Middletown 2882; State Hospital (insane), Norwich 2336; State Prison, Wethersfield, 579; State Farm for Women, Niantic, 63; Connecticut School for Boys, Meriden, 454; Long Lane Farm (industrial school for girls), 244; Reformatory, Cheshire, 275; Mansfield State Training School and Hospital (epileptics and feeble-minded), 755; State tuberculosis sanatoria at Cedarcrest, Meriden, Norwich, Laurel Heights, and Niantic.

**LEGISLATION.** The State General Assembly held its regular biennial session, Jan. 14 to May 8. There was passed the Fraud Law, which in its provisions to the "blue-sky" law of many other States, and providing protection for the public against the sellers of fraudulent securities. By statute, it was required that the insurance ratings of the owners and operators of motor vehicles be placed on the basis of merit. Provision was made for more uniform regulation of traffic in the State by police departments. Amateur athletic activities were placed under the control of the State Athletic Commissioner. The Legislature provided for the establishment of a State prison for women at the location of the existing State farm for women, and required that all women prisoners be removed from the State prison

at Wethersfield to the new location. A law was passed to make highway expenditures dependent on the receipts of the motor vehicle department. By resolution the Governor was directed to seek to have the flagship of Admiral Farragut, the USS *Hartford*, transferred to New London. The teaching of the flag code and the observance of flag day in the public schools were required by law. Among the numerous bills that failed of enactment were one for permitting the teaching of methods of birth control, supported by a strong following of clergymen, a bill to terminate gambling at Savin Rock, and a measure to authorize the expenditure of \$1,000,000 for the State improvement of earth roads. A bill for State rehabilitation of disabled workers was passed.

The constitutional provision limiting the time allowance of the Governor for signing bills to three days had long been neglected, Governor Baldwin having been the only executive of recent years to comply with it. Governor Trumbull having signed numerous bills after the end of the time specified in the Constitution, the State Supreme Court of Errors on July 25 rendered a decision invalidating an act of the Legislature of 1929 on the ground that it had not been signed within three days after the Legislature's adjournment, and was therefore dead. On advice of the Attorney-General that the decision affected the validity of some 1500 acts of the last and of previous legislatures, Governor Trumbull summoned a special session, which met on August 6. This session immediately passed a series of six bills reenacting the laws affected and, declaring that all enactments would thereafter be presumed, it signed, to have complied with the constitutional time requirement.

**POLITICAL AND OTHER EVENTS** The chief judicial event of the year was the invalidation, on July 25, by opinion of the State Supreme Court of Errors of a large number of acts of the 1929 session of the Legislature. The reason that the Governor had signed it after the expiration of the three-day limit for such action, imposed by the State Constitution. By inference this action of the court invalidated in all 1493 ostensibly existing laws that had been signed under like circumstances at various times by successive Governors. Of recent executives of the State the late Governor Baldwin alone was found to have signed all measures that he approved within the three-day period. The act to which the court's action immediately pertained was one to assist the State in acquiring for a tuberculosis sanatorium a part of the McCook estate at East Lyme. Invalidated laws were reenacted in mass by a special legislative session. See *Legislation*.

Some uneasiness on the score of the State's industrial prosperity was occasioned when the United States Rubber Company announced on August 19 its decision to close permanently and to remove to Detroit its establishment at Hartford for the manufacture of automobile tires. The removal deprived some 1400 wage earners of work and terminated a pay roll of about \$2,500,000 a year. It led to agitation for such reform of State taxation as would render the State more attractive as an industrial location. The annual State Fair, a long-established institution, was discontinued. A commission appointed by the Governor began on June 24 the preparation of its plans for a celebration of the coming tercentenary of the founding of Connecticut.

The plan to create a metropolitan district to include with the city of Hartford the communities of West Hartford, Windsor, Bloomfield, Wethersfield and Newington was put to a vote on October 8 in all the territory affected except Hartford itself, which cast its vote in November. With the exception of West Hartford, the adjacent towns voted in favor of the plan. The latter town, however, which was the most necessary of all to the combination, voted adversely by nearly two to one. The former Hartford home of Mark Twain at 351 Farmington Avenue was acquired on June 1 by a commission chartered by the Legislature for its preservation as a memorial. The city of New Haven purchased at Morris Cove and East Haven lands for the site of an airport and authorized the issue of \$325,000 in bonds for its development. The city finances of Waterbury were examined by the Charter Commission created by the Legislature. Waterbury made an effort to preserve its city market as a place for the direct exchange of farm products from grower to consumer, by enforcing an order against all sales save by the growers. The building of a dam at Woodville to store water from the Shepaug River for the municipal supply of Waterbury was carried toward completion.

**OFFICERS** Governor, John H. Trumbull, Secretary of State, William L. Higgings, Treasurer, Samuel R. Spencer, Comptroller, F. M. Salmon, Attorney-General, Benjamin W. Alling.

**JUDICIARY** Supreme Court of Errors: Chief Justice, G. W. Wheeler, Associate Justices, W. M. Maltbie, F. D. Maines, G. E. Hinman, John W. Banks.

**CONNECTICUT COLLEGE** A liberal college of arts and sciences for the higher education of women in New London, Conn., chartered in 1911 by the State of Connecticut. The enrollment for the autumn of 1929 was 563, distributed as follows: Freshmen, 174, sophomores, 141, juniors, 142; seniors, 106. The faculty numbered 65 members. The productive funds amounted to \$1,100,000, and the budget for the year, not including building operations, was more than \$500,000. There were 41,000 volumes in the library. During 1929 a new administrative building, Fanning Hall, was erected at a cost of \$290,000. President, Katherine Blunt, Ph.D., who succeeded Benjamin T. Marshall, D.D., as president in 1929.

**CONNERS**, WILLIAM JAMES. American capitalist, publisher, and politician, died Oct. 5, 1929, in Buffalo, N. Y. His common-school education ended at the age of 13, when he started to work on a steamboat. He had been a freight contractor since 1885 and in 1888 he entered the asphalt and stone-paving business. In 1916 he organized the Great Lakes Transit Corporation and bought all the railroad-operated steamships on the Great Lakes. In 1918 he bought and reclaimed 7000 acres of the Everglades in Florida and in 1924 built the Conners' Highway through them from the Atlantic to the gulf. His interest in publishing began when he became proprietor of the *Buffalo Enquirer* in 1895 and of the *Buffalo Courier* in 1897. He was a political leader in the Democratic party of New York, holding the chairmanship of the Democratic State Committee from 1906 to 1910. Mr. Conners was also a philanthropist, establishing in 1925 the Conners' Foundation, a fund of \$1,000,000 for the relief of the poor in the city of Buffalo.

**CONSERVATION.** See **FORESTRY**.  
**CONSTANTINOPLE.** See **TURKEY**.

**CONSUMERS' SOCIETIES.** See COOPERATION.

**COOPER, HENRY ERNEST** American lawyer and statesman, died May 15, 1929, in Long Beach, Calif. He was born in New Albany, Ind., Aug. 23, 1857, and was graduated from Boston University. In 1878 he was admitted to the bar in Suffolk Co., Mass., and in 1890 established practice in Honolulu. He was chairman of the committee of safety during the Hawaiian Revolution, Jan. 14-17, 1893, and on January 17 read a proclamation abrogating monarchical government and establishing provisional government in the Hawaiian Islands. From January to March, 1893, he was a member of the advisory council of the provisional government. He was judge of the first circuit court, 1893-95, Minister of Foreign Affairs, 1895-99, and in 1898, acting President of the Republic of Hawaii. He was also Minister of Public Instruction from June, 1896-March, 1899, Attorney-General of Hawaii, 1899-1900, when he also was president of the board of health. He was appointed the first Secretary of the Hawaiian Territory in 1900, when he practiced law after his retirement from public life.

**COOPERATION.** The outstanding event in the cooperative movement in the United States during the year was the creation of the Federal Farm Board as a result of the campaign pledges made by President Hoover in the presidential election contest of 1928. Before the year was over, the Federal Farm Board had already succeeded in organizing centralizing agencies in three of the great agricultural staples of the country, viz., wheat, wool, and cotton. Accordingly, there is presented in detail the plans of the Federal Farm Board, and also an outline of the proposed functions of the three agricultural corporations. Other matters discussed are the international status of cooperatives, the credit union and building and loan association movements in the United States, and the cooperative situation in Great Britain and Canada.

**FEDERAL FARM BOARD.** The special spring session of the Seventy-first Congress created a Federal Farm Board for the following purposes: To promote the merchandising of agricultural commodities in interstate and foreign commerce, to protect and control the processes of the marketing of agricultural commodities through the minimizing of speculation and the checking of wasteful methods of distribution, and to encourage the creation of producers' associations, or cooperatives, by controlling surpluses in agricultural commodities, through orderly production and distribution. Among its other major functions were the following: The Board was to be concerned with the promotion of education in the principles and practices of cooperative marketing, and also with the investigating of conditions of overproduction, especially with an eye toward checking such.

The act created a revolving fund of \$500,000,000 with which the Board was authorized to make loans to cooperative associations for the purpose of assisting them in the merchandising of their commodities, for the construction, purchase, or listing of marketing facilities, or preparing, handling, and storing agricultural commodities, for the formation of clearing house associations, and for educating the producers in the use of cooperative marketing. No loan might be granted for an amount of more than 80 per cent of the value of the facilities to be constructed

or purchased. Such loans were to be repaid over a period of not more than 20 years. The Board, too, might enter into agreements for the purpose of insuring cooperative associations against loss as a result of a decline in prices. Another important provision of the law was that the Board might recognize the creation of "stabilization corporations" if marketing conditions required it.

Chairman Alexander Legge, former president of the International Harvester Company, who was appointed by President Hoover to the head of the Federal Farm Board, in a speech before the American Institute of Cooperation at Baton Rouge La., July 30, declared that the major policy of his Board would be the expansion and strengthening of the cooperative movement. He refused to consider that the purpose of his agency was the handling of merchandise purely. Rather, its function lay in the creation of a long-time constructive programme with the end in view of stabilizing agricultural production and distribution. Another policy was to be the formation of large-scale central cooperative organizations. Chairman Legge assured the farmers that these large organizations would in no way endanger the existence of the smaller local associations. He said: "On the contrary, such agencies would help to build up and improve the condition of each and every cooperative organization now in existence."

The first loan made by the Federal Farm Board was one of \$300,000 to the Florida United Growers for the purpose of equipping certain citrus-packing plants with heating facilities, in order that these producers might meet government regulations in controlling the Mediterranean fruit-fly pest. This loan was regarded as an emergency measure.

As a result of the Federal Farm Board's encouragement, there was formed in October the Farmers' National Grain Corporation, a wheat-growers' cooperative group with facilities for the lending of \$100,000,000 to State cooperatives to help the wheat growers of the country in the orderly marketing of their crops. The method of operation of the corporation was succinctly summarized by Mr. Legge in the following statement:

There is a grain cooperative in every wheat state. It is open to the membership of every wheat farmer. The farmer may join, ship his wheat to a designated concentration point, where it will be graded and cleansed, and draw his advance. The cooperative will market the wheat in an orderly fashion through the year and will settle with the farmer on the basis of the final price obtained.

The Board is confident that, considering the soundness of underlying conditions which affect the price of wheat, the plan described above furnishes a completely safe basis for making loans from the Board's revolving fund. The Board places no limit on the amount available for the purpose and, if necessary, the Board will also ask Congress to appropriate more.

Requests for facility loans should be taken up through the Farmers' National Grain Corporation.

The second such corporation created was the National Wool Marketing Association, with a capitalization of \$1,000,000. The association was to be owned and controlled by the stockholding member agencies throughout the United States. Money was to be loaned on unsold wool and mohair, new marketing associations were to be set up in those districts not being served by growers' cooperatives, a sales agency was to be created for the purpose of making direct sales to the mills, research and publicity were to be carried on in the interests of the ranchers.

In December, the third such agency was announced by the Federal Farm Board. This was to

be the American Cotton Growers' Exchange, capitalized at \$30,000,000. It was expected that this would be the largest cooperative group in the world and that it would, in time, market the whole cotton crop of the country. The corporation will be empowered to provide central marketing facilities and sales services, to buy cotton from its stockholders (the cooperatives) and from outsiders, to deal in cottonseed; to manufacture cotton products; to lease, buy, or construct warehouses and gins where such facilities cannot be reasonably provided by local associations; to conduct research, publicity, and educational work in the interests of and among the cotton growers of the country. Other administrative plans will provide for the establishment of two marketing branches for short and long staple cotton. The cotton belt is to be divided into four grand divisions: the Southeast, made up of North Carolina, South Carolina, Georgia, and Alabama, the Mississippi Valley, made up of Mississippi, Louisiana, Arkansas, Missouri, and Tennessee, the Southwest, made up of Oklahoma and East Texas, the Far West, made up of West Texas (irrigated portion), New Mexico, Arizona, and California.

**AMERICAN INSTITUTE OF COOPERATION.** At the meeting of the American Institute of Cooperation, held at Baton Rouge, La., July 29 to August 6, the chief measure discussed was the creation of a Chamber of Agricultural Cooperatives for the purpose of combining the members of all agricultural cooperatives into a single body. This movement had been under way for more than a year, when a committee was appointed to study the feasibility of such a national organization. According to the chairman of the Institute, it was planned that the central organization should be comparable to the United States Chamber of Commerce and to the American Federation of Labor. One of its chief functions would be co-

operation with the Federal Farm Board and with the Cooperative Marketing division of the Department of Agriculture. At the conclusion of the sessions of the Institute, it was declared that the National Chamber was going to start with an initial membership of 2,000,000 farmers and that there was every reason to expect another 2,000,000 members in the near future. Leaders in the movement saw in the creation of this national chamber the launching of the greatest cooperative movement in the history of agricultural production in the United States.

**INTERNATIONAL STATUS.** *The Monthly Labor Review* for October, 1929, published an important summary of the status of consumers' cooperatives in 28 countries of the world. As indicated in the accompanying table, in a total population of more than 611,000,000 persons, there were to be found 34,000,000 members of cooperative societies, making a ratio of 5.56 per cent. The largest number of societies was to be found in Russia where almost 16,000,000 persons, or 11 per cent of the total population, were members of cooperative societies. Cooperative sales of more than \$100,000,000 annually are reached in France, Germany, and Great Britain. In Russia, it was reported that the total sales by the cooperative societies was \$2,810,000,000. In Finland, almost one-eighth of the population belonged to cooperative societies. In Great Britain, Hungary, Russia, and Switzerland, cooperative membership made up 10 per cent of the total population. It is to be noted, on the other hand, that in Australia, Canada, Spain, United States, and Yugoslavia, cooperators numbered less than 1 per cent. With respect to the figures cited for the United States, a correction must, however, be made. The 77,826 persons listed as belonging to cooperative societies include only membership in those organizations affiliated with the Central Educational Union. An independent survey made

**MEMBERSHIP AND SALES OF CONSUMERS' COÖPERATIVE SOCIETIES IN VARIOUS COUNTRIES**  
IN 1928

by the Bureau of Labor Statistics in 1925 estimated that membership in consumers' coöperatives in this country had reached a total of 500,000 persons.

**CREDIT-UNION MOVEMENT** The YEAR BOOK has referred before to the important rôle played by the credit-union movement in the history of the coöperatives in the United States. During the year 1928, 368 new credit unions made their appearance. These were located by States as follows:

	Number		Number
Alabama	41	Nebraska	4
Arkansas	1	New Hampshire	3
California	12	New Jersey	7
District of Columbia	1	New York	14
Georgia	30	North Carolina	23
Illinois	30	Ohio	2
Indiana	16	Oklahoma	1
Iowa	17	Oregon	3
Kentucky	4	Rhode Island	3
Louisiana	3	Tennessee	8
Maine	1	Utah	1
Massachusetts	55	"	17
Michigan	23	"	4
Minnesota	31	Wisconsin	7
Missouri	24	Total	368

As a result of the activities of the National Extension Bureau, the National Service Release Council of the Post Office Department and the Brotherhood of Railroad Clerks, the credit movement has become a permanent fixture in cooperative-society history. From Oct. 1, 1927, to Dec. 31, 1928, the number of credit unions among employees in the postal service increased from 83 to 190; a gain of 107. During the same period, the membership rose from 16,257 to 25,397, the assets increasing from \$1,001,535 to \$1,770,932, and the loans granted nearly doubling from \$3,183,890 to \$6,320,736.

**BUILDING AND LOAN ASSOCIATIONS** The United States League of Local Building and Loan Associations reported that the year 1928 showed an increase in the number of associations created, size of membership, and amount of business transacted. For the previous five years, it was stated that the building and loan associations of the country had been maintaining an annual increase in assets of more than \$800,000,000. In 1928 there were 12,666 associations in the country with a total membership of 11,995,905. This was an increase of 659,644 members over the year 1927. Assets in 1928 totaled \$8,016,034,327, an increase of \$859,827,788 over the previous year. In 1928 mortgage loans totaled \$7,336,124,154, an increase of \$711,305,735 over 1927. States in which building and loan associations had assets of more than a quarter billion dollars in 1928 were the following: California (\$297,000,000), Illinois (\$420,000,000), Indiana (\$298,000,000), Massachusetts (\$516,000,000), New Jersey (\$1,032,000,000), New York (\$401,000,000), Ohio (\$1,237,000,000), Pennsylvania (\$1,340,000,000), Wisconsin (\$251,000,000).

**FARMERS' COÖPERATIVES** A study made by the U. S. Department of Labor showed that in 1925 nearly one-half of the 10,803 farmers' organizations in the country were doing cooperative purchasing for their members. The classes of articles purchased included fuel, containers, seeds, fertilizers, building materials, implements, and hardware. In 1927 farmers' coöperatives purchased for their members goods valued at \$300,000,000.

Eight such associations were doing an annual cooperative purchasing business of more than \$1,000,000 each, and two of them handled annually \$10,000,000 worth of business apiece.

**FINLAND** This country, which is largely agricultural in its activity, in 1929 was probably more closely organized on cooperative lines than any other nation in the world. Membership in cooperative societies totals 600,000 persons, or approximately one coöperator for every six inhabitants of the country. In more than one-half of the Finnish Communes, one family out of every two, and in 10 per cent of the Communes, all the families belong to cooperative societies. The largest coöperatives' groups are the consumers organizations, the dairies, and the agricultural credit societies. Other societies include corn mills, sawmills, electric power societies, pulp societies, fishing societies, livestock groups, bakeries, construction firms, farms' supply association, telephone companies, cafés and restaurants. The consumers' organizations are the most important single group in the country having five times as many members as the credit groups. They have a total of a million and a half coöperators.

**GREAT BRITAIN** This country, which continues to be the seat of one of the greatest cooperative movements in the world, reported considerable progress. The figures collected by the Ministry of Labor for the year 1927 show an increase in membership of 392,000, or 7.66 per cent, an increase in capital of £7,794,000, or 5 per cent, and an increase in business of £28,300,000, or 10 per cent. During the years 1925-26-27, the consumers' cooperative movement gained nearly 900,000 members. This increase is attributed largely to intensive membership campaigns, advertising, and the adoption of coöperatives by many of the societies. The table that follows shows comparative data for 1926 and 1927.

#### GROWTH OF COÖPERATION, GREAT BRITAIN 1926-27

	1926	1927
<b>Retail societies</b>		
Number	1,318	1,314
Membership	5,129,000	5,520,000
Sales	\$894,560,648	\$964,408,175

It is interesting to record the progress of the cooperative movement in Great Britain in the period following the War. In 1913 there were 2,878,648 members of cooperative societies, in 1926, there were 5,186,728 members. Cooperative members and their families form from 40 to 45 per cent of the total population of Great Britain and from 45 to 50 per cent of the Scottish popu-

lation During the post-war period, there was a marked tendency toward the creation of larger societies. In 1914 the largest retail society (Leeds) had a membership of 47,967. By the end of 1928, the largest society (London) had 177,339 members. The Royal Arsenal at Woolwich and the Birmingham Society had 140,088 and 106,993 members, respectively. The trading operations of the retail societies are not confined to the distribution trades purely. There are societies that are engaged in hair-dressing, painting, as well as productive enterprise. It is to be noted however, that 80 per cent of the total business of the British coöperatives is to be found in the sale of foodstuffs. The sale of coal by 1926, however, already amounted to 78 per cent of the total. Experts noted a decline in the average sales per member since 1913. In the earlier year, the average sale was (at 1913 values) \$141.62, while in 1926 it was \$103.17. The following explanations were advanced: the decreased purchasing power of the membership, due to unemployment and underemployment, the establishment of membership on the basis of families, the development of service departments; and increased competition from private enterprise. These columns have referred before to the operations of the wholesale societies. There are three such organizations, viz, the (English) Coöperative Wholesale Society, the Scottish Coöperative Wholesale Society, and the Irish Agricultural Wholesale Society. The wide range of the English Society's activities is plainly indicated by the following: It distributes food, clothing, and furniture on a very large scale, it has increased steadily its business with agricultural coöperative societies in the supply of agricultural products, it operates a very large number of factories, mills, and workshops, and controls the marketing of its own manufactured products; it owns and operates a coal mine, it operates a number of farms, it controls its own banking department, it has a large service department for the purpose of selling services to the coöperative movement, e.g., auditing, health insurance, architectural service, building, solicitors' department, etc. The productive enterprises of the English Society include 2 biscuit works, 5 preserve works, 3 soap works, 10 flour mills, 1 tobacco factory, 1 lard refinery, 1 margarine works, 1 oil and cake mill, 4 printing works, 1 rope mill, 1 colliery, 3 flannel mills, 1 hosiery factory, 2 corset factories, 4 shirt factories, 3 underclothing factories, 4 woolen factories, 4 weaving sheds, 6 clothing factories, 10 boot and shoe works, 1 cannery, 4 cabinet factories, 1 brush works, 1 iron works, 1 bucket and fender works, 1 tin-plate works, 1 paint and varnish works, 1 pottery, a cycle and jewelry establishment, and several farms.

CANADA There were 30 coöperative societies affiliated with the Coöperative Union of Canada, an increase from 7 since 1923. In the earlier year, the membership was 4646 and by 1928 had grown to 10,366. Sales had increased from \$2,250,000 to \$5,397,000. These societies include nearly all the largest and most successful consumers' societies in the country. Their chief activities are the sale of groceries, hardware, dry goods, and . . . The ages of the societies range from 1 year and 2 months to 22 years and 6 months, the average being 10 years and 6 months. These 30 societies had a share capital of \$589,571 and showed a net profit for the year of \$342,750, of which patronage dividends

totaled \$252,976. None of the societies reported a loss on the trading for the year 1928.

RUSSIA The consumers' coöperative movement in this country in 1929 set up a fund for the purpose of carrying on a programme among women and children and for the instruction of mothers in child care. The money is raised on the basis of a deduction made from net profits and a certain percentage of the sales. With this fund, nurseries, kindergartens, and playgrounds were being established, as well as traveling health centres.

CANADIAN WHEAT POOL The Canadian wheat pool, organized in 1923, was based upon the creation of an association among a group of Alberta wheat growers who pledged themselves to deliver to the pool all their wheat crops for the next five years. In two weeks after the creation of the association, 25,000 farmers had joined the pool, their combined acreage representing 45 per cent of the entire wheat acreage of the province. Before 1924 was over, similar pools had been formed in Manitoba and Saskatchewan, these three being the prairie provinces of the Dominion. On July 28, 1924, the three pools formed a central selling agency, the Canadian Coöperative Wheat Producers, Ltd. In 1929 the pool included 132,800 of the wheat growers of the three prairie provinces and 12,000 farmers in the province of Ontario, the total acreage served covering 16,190,000 acres. In 1928 the pool had a gross turnover of \$323,000,000 and the members of the pool delivered 51.5 per cent of all the wheat marketed in Western Canada. As a result of the two cents' toll paid by each farmer in the pool, the organization was able to purchase a large number of elevators. In 1929 it owned 1417 of the 4692 elevators in the three prairie provinces. The significance of this pool can be understood when it is appreciated that, though Canada produces only 12 per cent of the world's wheat supply, it exports nearly twice as much wheat as any other country. In 1928, for example, Canadian wheat contributed 40 per cent of all the wheat entering into international trade. Of this, the pool controls not less than half. In 1928 international trade in wheat totaled 828,000,000 bushels, of which the pool's total handlings were 222,000,000.

See AGRICULTURE, HORTICULTURE, 101 Coöperative Association of Fruit Growers.

#### COOPERITE. See MINERALOGY.

COPPER The American copper industry in 1929, according to the U. S. Bureau of Mines, broke many records. Domestic withdrawals which had assumed record breaking proportions in the fall of 1928 continued at a high rate, and for the year 1929 were higher than ever before, even than during the war years. Copper prices rose from a monthly average of 13.9 cents a pound in January, 1928, to 15.9 cents in December, and continued the rapid advance to a high of 23.775 cents a pound, at refinery, Mar. 23, 1929, where it held until April 5. From April 5 to April 15, the price dropped to 17.775 cents a pound, where it remained up to the end of the year. Heavy demand followed by increased prices brought forth the highest smelter and refinery production on record. The unusual demand in the fall of 1928 drew heavily on stocks of refined copper and at the end of the year only 114,000,000 pounds were in stock, while the largely increased production during that period made itself apparent in blister stocks which were larger than at the end of 1927. Production was sufficiently ahead of withdrawals in 1929 for stocks of refined copper to much more

than double during the year. Curtailed production at the mines and smelters during the last quarter of 1929 was apparent first in blister stocks again and these were estimated by producers to have increased only about 5 per cent. The estimated smelter production from domestic ores for December, 1929, as reported by the smelters, was 146,000,000 pounds, 25,000,000 pounds lower than the average for the 11 months preceding.

Stabilization was the confessed goal of the copper industry, or at least that part of it represented by the large American-controlled copper-mining companies that produce about 70 per cent of the world output from mines in the United States, Chile, Canada, and Mexico. For the five years previous to 1929, the average price of copper had been about 14 cents, and only the tremendous consuming demand that was evident in the last months of 1928 and the first half of 1929 made so comparatively high a price as 18 cents possible.

Students of the market were divided on the cause of the slump in buying, but it seemed fairly certain that either the comparatively high price or the impending approach of the "industrial depression," was responsible for it. The curtailment that the big producers put into practice was not attempted by smaller independent mines, which were only too glad to seize the opportunity to sell their product at 18 cents a pound. As a result, the percentage of the total produced by the large mines was declining at the end of the year, although the trend was not marked.

Approximate production in 1928 and in 1929, by short tons, for the several important countries is given herewith. Estimates are based on figures published by the American Bureau of Metal Statistics and *Engineering and Mining Journal*.

#### WORLD PRODUCTION OF COPPER

Country	1928	1929
United States	896,000	1,011,000
Chile	319,500	350,000
Africa	141,000	150,000
Canada	96,500	120,000
Japan	73,000	82,000
Mexico	72,500	88,000
Peru	58,000	59,000
Others	227,000	276,000
Total	1,883,600	2,136,000

The smelter production of copper from domestic ores in 1929, as determined by the Bureau of Mines from reports of the smelters showing actual production for 11 months and estimated production for December, was 2,030,000,000 pounds, compared with 1,826,000,000 pounds in 1928. The 1929 production was 11 per cent higher than that of 1928, and was the largest production on record. The estimated smelter production from domestic ores for December, as reported by the smelters, was 146,000,000 pounds, which is 25,000,000 pounds lower than the average for the 11 months preceding and compared with an estimate of 179,000,000 pounds for December, 1928.

The production of new refined copper from domestic sources, determined in the same manner as smelter production, was about 2,022,000,000 pounds, compared with 1,792,000,000 pounds in 1928. In 1929 the production of new refined copper from domestic and foreign sources

amounted to about 2,772,000,000 pounds, compared with 2,488,000,000 pounds in 1928, an increase of 284,000,000 pounds, or 11 per cent. The production of secondary copper by primary refineries increased from 232,000,000 pounds to about 308,000,000 pounds in 1929, or 76,000,000 pounds, so that the total primary and secondary output of copper by the refineries was 13 per cent higher in 1929 than in 1928, being about 3,080,000,000 pounds, compared with 2,720,000,000 pounds.

#### COPPER PRODUCTION IN UNITED STATES [Short tons]

	1928	1929 *
Eastern States	14,780	16,600
Southeastern Missouri	31	
Michigan	89,221	92,500
Western States		
Arizona	366,138	416,800
California	12,575	16,600
Colorado	4,297	4,200
Idaho	1,036	2,400
Montana	124,131	149,300
Nevada	79,438	66,000
New Mexico	44,927	50,000
Oregon	179	400
Texas	224	200
Utah	146,618	160,100
Washington	589	600
Wyoming		
Alaska	20,711	20,200
Total	901,898	995,900

\* Estimated.

\* Figures obtained from the Geological Survey, Department of the Interior.

The imports of unmanufactured copper during 1929, according to the Bureau of Foreign and Domestic Commerce, amounted to 974,232,305 pounds, a monthly rate of 81,000,000, compared with 787,083,840 for 1928, a monthly rate of 66,000,000. The total increase of approximately 187,000,000 pounds is equivalent to about 25 per cent.

Exports of metallic copper during 1929 amounted to 992,894,019 pounds, compared with 1,121,186,640 in 1928. Exports for the last two months averaged about 57,000,000, as compared with an average of about 88,000,000 pounds for the first 10 months. Of the individual countries, the United Kingdom received about 194,671,328 pounds of refined copper in ingots, bars, rods, and other forms, during the first 11 months. Germany was next, with 168,531,023 pounds during the same period, and France was third, with 11,488,031 pounds. As can be seen by comparing the imports with exports, for the first time in many years, the United States had only a small exportable surplus and, in fact, during the last few months of the year, that country was actually importing more unmanufactured copper than it was exporting refined copper. As is shown in the table on page 218, domestic production was only 173,000,000 pounds greater than domestic consumption. Inasmuch as during the year about 151,000,000 pounds were added to the refinery stocks, the exportable surplus of domestic copper amounted to only 22,000,000 pounds.

Refineries report that at the end of 1929 approximately 265,000,000 pounds of refined copper would be in stock, considerably more than double the 114,000,000 pounds at the end of 1928. It was estimated that stocks of blister copper at the smelters, in transit to refineries, and at refineries, and materials in process of refining would be about 443,000,000 pounds in December 31, compared with 423,000,000 pounds at the end of

NEW REFINED COPPER WITHDRAWN FROM  
TOTAL YEAR'S SUPPLY ON DOMESTIC AC-  
COUNT, 1928-1929, IN POUNDS

	1928	1929
Refinery production of new copper from domestic sources	1,792,000,000	2,022,000,000
Refinery production of new copper from foreign sources	696,000,000	750,000,000
Imports of refined copper (December, 1929, estimated)	85,000,000	128,000,000
Stocks of new refined copper on January 1	171,000,000	114,000,000
	2,744,000,000	3,014,000,000
Exports of refined copper (ingots, bars, rods, or other forms) (December, 1929, estimated)	1,021,000,000	900,000,000
Stocks December 31	114,000,000	265,000,000
	1,135,000,000	1,165,000,000
Total withdrawn on domestic account	1,609,000,000	1,849,000,000

1928, an increase of 20,000 pounds. Therefore, an increase of 171,000,000 pounds in total smelter and refinery stocks was indicated.

The quantity of new refined copper withdrawn on domestic account during the year was about 1,849,000,000 pounds, compared with 1,609,000,000 pounds in 1928, an increase of 240,000,000 pounds, or nearly 15 per cent, and was the highest ever recorded. The method of calculating domestic withdrawals is shown in the accompanying table.

For several years, although its copper production had been increasing, the relative importance of United States mines was decreasing. In 1924 the United States mines produced 55 per cent of the world total, in 1928 only 45 per cent, although actual production was 60,000 tons higher. The growing importance of the large American-owned mines in Chile, the Belgian Congo Company, Katanga, and scattered producers in Canada and Europe had tended to push the American properties into the background. It was extremely interesting to note, therefore, that United States mines increased their production of copper 115,000 tons, and their share of the world total, 1 per cent to 46 per cent in 1929. A continuation of this upward trend appeared unlikely, however. Not only had the Chilean mines a vast excess capacity, but, in addition, within four years, drilling had indicated the existence of six large copper mines in Northern Rhodesia. The grade of the ore was comparatively high, about 4 per cent copper on the average, compared with about 1.5 per cent at the large American mines, and the tonnages available are enormous. About 600,000,000 tons of ore had been indicated by the end of 1929.

Production from the first of these mines was to start in 1931. By 1935 they were expected to be producing 350,000 tons of copper annually. But, although South America and Africa probably would supply the increases in future demand, the mines of the United States were far from exhaustion and their importance, though diminished, will be considerable for many generations to come.

See also METALLURGY.

**COPYRIGHT.** Registrations for the fiscal year 1928-29, according to the report of the United States Register of Copyrights, numbered 161,959, as compared with 193,914 for the pre-

ceding year. Of these, 57,614 were classed as books, but included pamphlets, leaflets, and contributions to periodicals, those printed in the United States numbering 52,280, those printed abroad in a foreign language, 3868, while the remainder, 1460, were English books registered for *ad interim* copyright. The chief classes of the remaining registrations, in the order of numerical importance, were Periodicals, 44,101 numbers, musical compositions, 27,023, prints and pictorial illustrations, 9873, photographs, 4850; dramatic or dramatico-musical compositions, 4584, works of art, including models or designs, 2840, maps, 2232, drawings or plastic works of a scientific or technical character, 1511, motion-picture photoplays 1087, and motion pictures not photoplays, 1232. The renewals numbered 4948, as compared with 5447 in the preceding year. The fees paid during the year amounted to \$308,993. The total number of articles deposited during the fiscal year ended June 30, 1929, was 264,204.

The gross receipts of the Register's office for the fiscal year were \$322,135, the total expenditure for salaries, \$224,905, and for supplies, \$1611. The year's business showed a substantial increase over that of 1928, which was the largest in the history of the office up to that time.

Copyright legislation was enacted, May, 23, 1928, to increase the copyright fee for registration of all published works to \$2. This fee was formerly \$1. The fee for an unpublished work remains at \$1. Fees for most other copyright services have been correspondingly increased. One copyright proclamation was issued, January 1, 1929, namely, in behalf of citizens of the United States, Dec. 15, 1928, including protection with respect to the mechanical reproduction of music, under Sec. 1 (c) of the Copyright Act of 1909.

**CORINTH, EXCAVATIONS ACT.** See ARCHAEOLOGY.

**CORN.** The production of corn in 1929 of 15 countries reporting to the International Institute of Agriculture, Rome, was estimated at 3,267,911,000 bushels, as compared with 3,196,189,000 bushels in 1928. This yield was only slightly under the average yield for the five years 1923-27. The total corn area for these countries in 1929 was reported as 127,000,000 acres, which was only 0.4 per cent below the area in 1928 and 0.8 per cent above the average for the five year period. The 1929 production in the more important corn producing countries, not including the United States, was reported as follows: Rumania, 240,148,000 bushels, Jugoslavia, 160,742,000 bushels, Italy, approximately 85,000,000 bushels, Hungary, 76,610,000 bushels, Bulgaria, 36,069,000 bushels, and Spain, 25,190,000 bushels. The Soviet Republics in 1927, the last year for which data are available, produced 148,834,000 bushels. Owing to a favorable ripening and harvesting season, the European crop was reported as generally good in quality. Reports for the crop year 1928-29 placed the production of Argentina at 232,000,000 bushels and of the Union of South Africa at 65,941,000 bushels.

For the five years 1921-25, the average annual yield of Brazil was 177,338,000 bushels, of Mexico, 84,406,000 bushels, and of Egypt, 69,096,000 bushels. Canada in 1929, according to estimates, produced 5,053,000 bushels on 152,000 acres, which represented a recovery of more than 9 per cent in acreage over the preceding year but still left the production only a little over half

of what it was before the coming of the corn borer.

In the United States the production of corn for all purposes in 1929, as estimated by the Department of Agriculture, was 2,622,189,000 bushels, which was 7 per cent less than the crop of 2,818,901,000 bushels in 1928 and 4.6 per cent below the average production of 2,747,000,000 bushels for five years 1923-27. The 1929 area in corn, 98,018,000 acres, was 2.6 per cent less than in 1929 and 2.8 per cent less than the average acreage from 1923 to 1927. The average yield per acre in 1929, 26.8 bushels, was 4.3 per cent below the 1928 yield of 28 bushels and 3.6 per cent below the ten-year average yield of 27.8 bushels.

The December 1 farm price was estimated at 78.1 cents per bushel as compared with 75.2 cents per bushel on Dec. 1, 1928. On this basis the total farm value of the 1929 crop was \$2,048,134,000 or about 3 per cent less than the value of the 1928 crop of \$2,119,046,000. In 1929 the corn crop of the East North Central States was 14 per cent smaller than in 1928, while the West North Central States showed a reduction of 8.4 per cent and the North Atlantic States of about 6 per cent. Production in the Southern States indicated an increase of 4.7 per cent and in the Western States of 9 per cent over that of the preceding year. The leading corn-growing States and the crops produced in 1929 were as follows in bushels: Iowa, 437,760,000 bushels, Illinois, 311,500,000, Nebraska, 237,744,000, Minnesota, 148,855,000, Indiana, 131,908,000, Ohio, 128,407,000, Missouri, 126,524,000, South Dakota, 112,085,000, and Kansas, 106,802,000. No other States reported yields of more than 100,000,000 bushels. The largest areas devoted to the crop were reported by the following States: Iowa, 11,202,000 acres, Illinois, 9,576,000, Nebraska, 8,937,000, Kansas, 6,634,000, Missouri, 6,260,000, Texas, 4,722,000, Indiana, 4,483,000, South Dakota, 4,469,000, and Minnesota, 4,089,000. The average yield per acre ranged from 12 bushels in Montana to 40 bushels in Iowa and Wisconsin, but the New England States reported an average yield of 41.1 bushels. The average farm price per bushel on Dec. 1, 1929, was 62 cents in South Dakota to \$1.30 in Arizona. This price was a dollar or more in only sixteen states.

A study made by the Department of Agriculture and based on reports from 3790 farms indicated that the average cost of producing ear corn in the United States in 1928 was 73 cents per bushel. Production costs reported for the six years 1923 to 1928 showed the annual cost of producing an acre of corn varied from \$22.65 in 1928 to \$24.95 in 1927 and the cost per bushel from 68 cents in 1923 to 82 cents in 1924. For the country as a whole, the average bushel costs in 1926 and 1927 were 3 cents less than in 1928. In the South Central States, the corn yields in 1928 were relatively low and the cost of 92 cents per bushel was 11 cents higher than in 1927. In the West North Central States, the bushel cost in 1928 was 56 cents, in the East North Central States, 63 cents, and in the Western, North Atlantic, and North Atlantic States, it was 82, 87, and 88 cents, respectively.

According to a report also made by the Department of Agriculture, the production of corn silage in 1929 was estimated at 29,908,000 tons, or 5.3 per cent less than the 31,579,000 tons produced in 1928. The area cut for silage in 1929 was 4,304,000 acres, as compared with 4,251,000

acres in 1928 and 4,539,000 acres in 1927. The average yield of corn silage was placed at 6.95 tons per acre in 1929, 7.43 tons in 1928, and 6.94 tons in 1927. The corn area utilized for hogging off, grazing, and forage in 1929 was 11,113,000 acres, in 1928, 10,974,000 acres, and in 1927, 11,016,000 acres. Wisconsin in 1929 ranked first in silage production, with 7,118,000 tons, followed by New York, with 3,018,000 tons, Minnesota, with 2,814,000 tons, and Illinois, with 2,443,000 tons. California and the New England States reported the highest average yields of 11.1 and 12.1 per acre for the year.

The stocks of corn on farms of the United States on Nov. 1, 1929, were reported at 70,863,000 bushels, or 2.7 per cent of the total crop. During the fiscal year ended June 30, 1929, the United States exported 18,831,000 bushels of corn, 283,000 barrels of corn meal, 231,667,000 pounds of cornstarch and corn flour, 115,877,000 pounds of corn sirup, and 323,000 pounds of corn oil. The imports during the same period amounted to 490,000 bushels, as against 5,463,000 bushels during the preceding fiscal year.

No important changes in the European corn-borer situation were recorded during the year and the natural spread of the insect by flight from 20 to 30 miles was normal. Several outlying points of infestation were cleaned up in accordance with established practice (see *European corn borer*, under ENTOMOLOGY, ECONOMIC). The National Corn Huskers contest of 1929 was held at Platte City, Mo., November 15 and Walter Olson of Illinois, who won the championship last year, again led the field by husking 25.27 bushels in 80 minutes. The results of the contest were broadcasted and motion pictures of it were taken. A prize of \$1000 donated by J. E. Phillips of Oklahoma was announced for the 1930 contest.

**CORN BORER.** See ENTOMOLOGY, ECONOMIC. **CORNELL UNIVERSITY.** A nonsectarian institution for the higher education of men and women in Ithaca, N. Y., founded in 1865. There were 5500 students enrolled in the autumn session of 1929, distributed as follows: Graduate school, 653; college of arts and sciences, 1959; law, 202; medicine, 244; architecture, 179; engineering, 959; veterinary medicine, 170; agriculture, 701; home economics, 550. Of these students, 1378 were women. For the summer session, the registration was 2415. The faculty, composed of 1160 members, had 287 professors, 204 assistant professors, 10 lecturers, 419 instructors, and 240 assistants. The productive funds on June 30, 1929, were \$22,998,528. The income applicable to current expenses of the fiscal year was approximately \$8,000,000, including \$2,075,000 of State, and \$382,500 of Federal, appropriations. Gifts amounting to \$4,427,172 were received in the year 1928-29. The lands and buildings were valued at \$10,581,000 and the equipment at \$4,064,000. The library contained 785,000 volumes.

Gifts received during the year included \$1,500,000 from Myron C. Taylor for a new law school building, \$2,786,000 from the estate of Payne Whitney for endowment of the medical college, and \$68,000 from the estate of John McMullen for scholarships in agriculture. A bequest was made that the General Alumni Board had offered substantial aid toward the establishment of a centre of research in biology designed to coordinate the work of investigators in the physical and biological sciences. An anonymous gift of \$200,000 as the beginning of a \$1,000,000

pension fund was also received, conditional on the raising of \$800,000 from other sources

Additions to the staff of professors included Henry W. Edgerton and Gustavus H. Robinson in law, R. R. Rosborough in classics, and Paul J. Weaver in music. The faculty lost by death A. C. Beal, professor of floriculture, and G. R. Chamberlain, professor of drawing, and by retirement Dr. V. A. Moore, dean of the veterinary college. Prof. Edward L. Thorndike of Teachers College, Columbia University, gave the Messenger lectures in the history of civilization. The visiting lecturers in chemistry on the George Fisher Baker foundation were Prof. F. M. Jaeger of the University of Groningen and Prof. George P. Thomson of the University of Aberdeen.

The Balch Halls for Women were completed at a cost of \$1,700,000, providing living quarters for 318 students. A war memorial consisting of two 90-foot towers and a connecting cloister, all of them incorporated in the men's dormitory system, was brought almost to completion, together with three additional dormitory units affording quarters for 101 students. Progress was made on a new building for which the State had appropriated \$1,100,000 to house the departments of plant science at the college of agriculture. A new water-storage and filter system was installed for the supply of the campus. Announcement was made in March that the Lying-In Hospital had joined the New York Hospital-Cornell Medical College Association, and in June ground was broken for the association's new medical centre at 68th Street and York Avenue, New York City. President, Livingston Farrand, M.D., LL.D.

**CORN PRODUCTS.** See **CHEMISTRY, INDUSTRIAL.**

**COSMIC RAYS.** See **PHYSICS**

**COSMOGONY.** See **ASTRONOMY**

**COSTA RICA,** *kō'stā rēk'ā.* A republic of Central America lying between Nicaragua and Panama, and bounded by the Caribbean Sea on the east and the Pacific Ocean on the west. Capital, San José.

**AREA AND POPULATION.** The area is estimated at 23,000 square miles. The population was 471,524 at the 1927 census, as compared with 243,205 at the census of 1892. The estimated population on Jan. 1, 1928, was 480,326.

In 1927 the movement of population was: Births, 22,588, deaths, 10,687, marriages, 3769. In the same year, the immigrants numbered 7975 and the emigrants, 7274. The populations of the larger cities in 1928 were as follows: San José, 51,459; Alajuela, 8611; Cartago, 16,261; Heredia, 10,763; Liberia, 7473, Limón, 15,600, and Puntarenas, 7848.

**EDUCATION.** Primary instruction is free and compulsory, and the elementary schools are under local councils, but subvented by the central government. In 1927 there were 494 elementary schools open, with 1685 teachers and 46,248 pupils enrolled. The average attendance was 42,309. For secondary instruction, there are at San José a lyceum for boys with 556 pupils and a college for girls with 478 pupils. The normal school at Heredia had 343 students. There are two colleges located at Cartago and Alajuela. There are also professional schools of pharmacy, law, medicine, and dentistry. Expenditure on education in 1927 was 3,684,967 colones.

**PRODUCTION.** The chief occupation in the country is agriculture, although there are large areas not yet cleared that contain valuable cabinet

woods. Coffee and bananas are the principal agricultural products and normally comprise 50 per cent and 33 per cent, respectively, of the country's exports. Coffee is the predominant factor in Costa Rican economy. Coffee crops and prices were good in 1926 and 1927, normal in 1928, and depressed in 1929. The 1929-30 crop, it is estimated, will show a 15 per cent increase over that for 1928-29. Coffee produced in 1927 totaled 16,154 metric tons valued at \$10,634,000, and bananas, 7,869,175 stems, valued at \$5,891,292. The volume of banana exports reached its peak in 1913 and has steadily decreased since that time, owing to the Panama disease and the abandonment of exhausted lands. Cacao production is rapidly expanding, the value of exports in 1928 being nearly double those for the previous year. Sugar, once of considerable value, is playing an ever decreasing rôle. Gold and silver mining also are important industries of the country, being carried on on the Pacific coast. There are also deposits of manganese ore near the Pacific.

**COMMERCE.** The total foreign trade of Costa Rica for 1928 amounted to \$37,528,550, of which \$17,892,709 represented imports and \$19,635,841 exports. The favorable balance of trade was \$1,743,132. The 1927 total trade was \$34,369,117, of which \$16,310,784 represented imports and \$18,058,333, exports. Imports in 1928 increased by \$1,581,925 over the previous year and exports, by \$1,577,508.

More than half of the total imports into Costa Rica in 1928, or \$8,978,924, came from the United States, with Germany and the United Kingdom next. Imports to the value of \$2,858,866 came from the United States, respectively. In the same year, the United Kingdom was Costa Rica's leading customer, taking more than half (\$10,540,690) of the total exports. Exports to the United States, mostly bananas, were valued at \$6,028,558, and to Germany, at \$1,885,468. The principal exports in 1928 were bananas, \$5,492,611, coffee, \$12,379,558 (\$10,611,179 in 1927), cacao, \$1,024,544, and gold and silver, \$207,855. Principal imports in the same year were automobiles and accessories, cotton, silk, and wool manufactures, cattle, cement, food products, leather, petroleum, and zinc.

**FINANCE.** The revenues for 1928 totaled 33,318,699 colones, which was 2,734,576 colones, or 11 per cent, above the 1927 revenues and 5,818,699 colones above the amount estimated in the budget. (One colon equals \$0.25.) Total expenditures amounted to 28,406,443 colones, leaving a balance of 4,930,575 colones. Of the balance, 2,878,392 represented the amount unspent of 3,000,000 colones entrusted to the Mortgage Credit Bank for the promotion of economic progress. The expenditures were distributed as follows: Education, 22 per cent, department of promotion, 18.3 per cent, treasury department, 14.6 per cent, public safety, 9.54 per cent including 2 per cent for actual military purposes. The circulation of currency issued by the International Bank and the *Caja de Conversión*, a credit fund, diminished from a total of 2,000,000 colones on Apr. 27, 1928, to 22,025,450 colones on Apr. 22, 1929. The public debt on Jan. 1, 1929, stood at 83,605,000 colones (\$20,901,000), of which \$7,743,000 represented the American debt, \$1,658,000, the British debt; and 6,648,000 French francs, the French debt. The sum of \$1,080,000 in bonds was held abroad for the electrification of the Pacific Railroad.

**COMMUNICATIONS.** In 1927 there entered the ports of the Republic 696 ships of 1,321,637 tons, and 698 ships of 1,326,497 tons cleared. The length of railways was 413 miles, of which 81 miles were State owned. Electrification of the state-owned lines was expected to be completed in January, 1930. Air-mail service between Guatemala and Costa Rica was inaugurated Sept. 15, 1929. In 1926 there were 2174 miles of roads partially suitable for motor traffic. In 1927 there were 2740 miles of telegraph wire and in 1925 2173 telephone instruments were in use. In 1927 there were 1480 automobiles registered.

**GOVERNMENT.** The executive power is vested in the President who is elected for four years and who carries on his administration through seven secretaries of state appointed by him and responsible to him, legislative power is in a chamber of representatives, called the Constitutional Congress, with 43 deputies, elected for four years, one-half retiring every two years. Voting for President, deputies, and municipal officers is secret, direct, and free. President in 1929, González Viquez, who was elected on Feb. 12, 1928, for the term 1928-32.

**HISTORY.** The year 1929 was comparatively uneventful in Costa Rica. Ravages of the banana blight, a new law passed August 12 increasing the export tax on bananas and restricting their cultivation, and the growing competition of new plantations in Panama combined to depress further the banana industry. On April 7, President Viquez announced that Roberto Smith had been appointed Foreign Minister, . . . Rafael Castro Quesada, who became . . . the Interior. At the same time, the congressional president, Arturo Volo, was named Minister of Agriculture. The Government indorsed the proposal of the President of Nicaragua that the joint interests of the five Central American republics be represented in each South American capital by a single plenipotentiary. Diplomatic relations with Panama, which were resumed in October, 1928, after being severed for seven years, furthered during 1929 the reconciliation of these formerly estranged neighbors.

#### COST OF LIVING. See STATISTICS

**COTTON.** The cotton crop of the United States for 1929 was estimated by the Crop Reporting Board of the United States Department of Agriculture on Dec. 9, 1929, at 14,919,000 bales of 500 pounds gross weight, compared with 14,478,000 in 1928, 12,955,000 in 1927, and 17,977,000 in 1926. The yield of lint per acre was estimated to average at 155.3 pounds, as compared with 151.8 in 1928 and 154.5 in 1927. Of 47,569,000 acres in cultivation July 1, 33 per cent was abandoned, leaving 45,981,000 for harvest. The estimated farm value of the lint was \$1,225,032,000 and of the cottonseed, \$201,096,000, or a total of \$1,426,128,100 for the crop. The 1928 values were \$1,301,796,000 for the lint and \$233,447,000 for the seed.

The world's supply of American cotton beginning the 1929-30 season was approximately the same as at the start of the previous season. An increase of slightly more than 400,000 bales in production was offset by a decrease of about 600,000 bales in the carry-over, leaving a total supply of about 19,400,000 bales, compared with 19,600,000 bales in the 1928-29 season.

The areas planted to cotton in 1929 in the important cotton-producing countries of the world, excluding China, totaled 73,431,000 acres, or 0.3

per cent more than in 1928. Estimated production in 1929 in important countries were: United States, 14,919,000 bales, Egypt, 1,042,000, U. S. S. R. (Russia), 1,325,000; Mexico, 235,000; Peru, 210,000; Anglo-Egyptian Sudan, 171,000, and Chosen (Korea), 145,000. *The World's Cotton Situation*, an annual review by John A. Todd, estimated (September, 1929) the United States 1929-30 crop at 15,000,000 bales, or 55 per cent of the world's total, India, 5,750,000, Egypt, 1,700,000, U. S. S. R. (Russia), 1,500,000, China, 1,750,000, and other countries, 2,300,000, totaling 29,200,000 bales, compared with a similar estimate of 27,890,000 for 1928-29.

The world's production of commercial cotton in 1928 was estimated by the U. S. Bureau of the Census at about 25,611,000 bales. The International Institute of Agriculture reported the principal cotton countries and their crops to include the United States, with 14,478,000 bales, India (census estimate), 4,718,000, Egypt, 1,628,000, and U. S. S. R. (Russia), 1,208,000. Other countries with noteworthy production were Mexico, 239,000, Peru, 200,000, Anglo-Egyptian Sudan, 142,000, and Chosen (Korea), 150,000 bales. The Bureau of the Census reported the 1928 crop of the United States to be 14,297,000 bales, China 1,550,000, and Brazil 520,000 bales.

The cotton crop of the United States for 1928, as reported by the Bureau of the Census, the estimated crop for 1929, and the quantity reported ginned to Dec. 13, 1929, are shown in the accompanying table.

UNITED STATES COTTON CROP 1928-29

States	Crop 1928	Estimated	Reported
		Crop 1929	Ginned
	500 lb	500 lb	December
	bales	bales	13, 1929
			Running
			bales
United States	14,296,549	14,919,000	13,461,630
Alabama	1,096,624	1,335,000	1,237,093
Arizona	145,731	156,000	117,718
Arkansas	1,216,241	1,490,000	1,287,594
California	171,042	242,000	208,086
Florida	20,051	29,000	29,745
Georgia	1,053,205	1,345,000	1,226,644
Louisiana	685,868	810,000	788,471
Mississippi	1,462,021	1,915,000	1,746,175
Missouri	146,921	215,000	172,067
New Mexico	82,177	84,000	74,154
North Carolina	869,248	736,000	657,034
Oklahoma	1,187,042	1,200,000	1,046,730
South Carolina	744,890	845,000	750,064
Tennessee	423,471	515,000	420,865
Texas	4,941,545	3,950,000	3,658,605
Virginia	44,764	46,000	89,579
All others	6,206	7,000	6,006

The table includes, for 1929, under the ginning report, 520,072 round bales, counted as half-bales, and also 20,701 bales of American-Egyptian cotton, practically all grown in Arizona. The estimated crop of Arizona for 1929 includes 34,000 bales of American-Egyptian cotton. The crop of Lower California, usually marketed through California, is estimated at 80,000 bales, not included in the totals.

During the cotton year ended July 31, 1929, oil mills in the United States crushed 5,061,055 tons of cottonseed. The products derived from the seed included 1,085,766 bales of lint, 1,368,279 tons of hulls, 2,281,576 tons of cake and oil meal, and 1,604,131,038 pounds of oil. Approximately 174,100 tons of cottonseed meal was used as fertilizer in the period, compared with 250,-

000 tons and 444,000 tons, respectively, in the two preceding cotton years.

Exports of cotton and linters for the year ended July 31, 1929, amounted to 8,043,588 bales of cotton and 186,211 bales of linters, or a total of 8,229,799. Mills in the United States consumed in this period 7,098,946 bales. The principal exports were to the United Kingdom, 1,830,588; Germany, 1,796,798; France, 774,574; Italy, 716,802; other European countries, 1,092,588; and Japan, 1,309,183 bales. Of a total of 457,804 bales imported during the same period, Egypt supplied 296,286; Peru, 17,353; China, 34,857; Mexico, 52,009; and British India 54,424 bales. Mills in the cotton growing States continued to consume the greater part of the cotton used in American mills, 5,400,890 bales, compared with 1,446,693 in New England and 251,363 in other States. Of 34,585,304 spindles in place Dec 31, 1929, 29,069,510 were active during December, of which 17,063,774 were located in cotton States, 9,845,686 in New England States, and 1,260,050 in other States. The percentage of idle spindles was greatest and the average number of hours per spindle was lowest in New England.

Middling cotton at 10 spot markets averaged 18.67 cents a pound during the year ended July 31, 1929, or about one cent less than the previous year. Prices were mostly within a range of 1½ cents. Fluctuations occurred thereafter due to acreage, drought, and weevil damage, and then a sharp drop took place in October to the low of 1929, 10.55 cents, in sympathy with stocks. Recovery of one cent or more on favorable loan terms of the Federal Farm Board was temporary, since price trends were downward during the rest of the year, closing on December 31 at 17.25 cents. New York, 17.01; New Orleans, and 17.30; Galveston. The New York Cotton Exchange began to trade exclusively on a new contract providing for Southern delivery, but until December 15 no deliveries had been made in the South largely because of a substantial stock in New York. A Congressional investigation of the influence of market speculation on cotton prices commenced in December.

The 1929 cotton-growing season was featured by greatly reduced yields in Oklahoma and Texas because of drought, and about average yields in the eastern part of the cotton belt where threatened boll-weevil damage was checked by severe drought, which also seriously interfered with production. Increased production was reported from the Mississippi Valley States.

Cotton production in the United States has continued to move westward and northward and has been meeting increasing foreign competition. The shift has been due in part to the fact that the boll weevil has done less damage along the northern and western borders than in the central and southern parts of the Cotton Belt. The increasing cost of labor has encouraged the use of more machinery and this has tended to discourage cotton production in the eastern States of the Cotton Belt. Conditions in the Great Plains regions and in the alluvial cotton lands along the Mississippi have been more suitable for expansion than in the eastern States. Foreign competition has been increasing not only in volume of cotton production but also by improvement in quality in some foreign countries, particularly India.

The pink bollworm outbreak in 1927 in west Texas, with scattered infestation of nearly 400,

000 acres in seven counties, was practically suppressed by intensive clean-up methods and conditions in the 1927-28 winter unfavorable to hibernating larvae. Weather also served to keep down the pest in parts of Arizona and New Mexico and in the El Paso Valley of Texas. Quarantine restrictions in these sections apparently prevented the spread of pink bollworm to new areas. The cotton leaf worm also caused damage in the Southwestern States. The boll weevil, cotton flea hopper, and cotton bollworm received the usual attention from control agencies. Cotton-root rot continued to be of importance in the Southwest. Cotton investigators of the U. S. Department of Agriculture and of the Texas Experiment Station studied the life history and habits of the disease. See ENTOMOLOGY, ECONOMIC.

Cotton of the 1929 crop ginned prior to December 1 was rather low in grade and short in staple, according to a report based on the 12,840,892 bales of American upland cotton reported by the Census Bureau as ginned up to that date. About 8,039,000 bales, or 69.6 per cent, were white in color and middling or better in grade; strict low and low middling, 10.4 per cent; below low middling, 112,500 bales, spotted and yellow tinged, 10.1 per cent, and stained, 7700 bales. Of a total of 10,040,000 bales, or 78.2 per cent tenderable, 8,644,200 bales ranged in staple from ¾ inch to 1½ inches, inclusive, and 1,395,800 bales were over 1½ inches in staple.

The International Universal Cotton Standards Conference held its third biennial session in Washington in March, 1929, and approved copies of the standards for American cotton for the use of the U. S. Department of Agriculture and European organizations during the two-year period beginning Aug. 1, 1929. Issuance of tentative types illustrating preparation of long-staple cotton of strict middling, middling, and strict low middling for permissive use during the two-year period was agreed to and the international organizations as parties to the Universal Standards agreement was considered. The conference also urged the improvement of ginning methods of American ginners which result in deterioration in the quality of spinnable cotton, declaring that poor ginning is detrimental to the interests of the grower, merchant, and spinner.

Other cotton-growing and -consuming countries in the world continued to promote cotton production wherever practicable. The Empire Cotton Growing Corporation and the British Cotton Growing Association were active within the British Empire. The corporation maintained or supported experimental farms in Queensland, Union of South Africa, Swaziland, Southern Rhodesia, Anglo-Egyptian Sudan, Nyasaland, Nigeria, and Fiji. The British Cotton Committee continued to finance agricultural research and technology of manufacture, giving especial attention to its institute in Indore and its technological laboratory at Bombay. Dominion and provincial departments of agriculture and other agencies also were engaged in cotton production and improvement. The crop of 1927-28 in the British Empire, including India, amounted to 355,038 bales, or 1.1 per cent more than the previous year. The principal producing countries in 1927-28 were Anglo-Egyptian Sudan, 120,115; Uganda, 138,486; Tanganyika, 32,965; Nigeria, 20,930,

Union of South Africa, 11,013; Queensland, 10,266; Iraq, 5200; West Indies, 4485; Nyasaland, 4470, and Cyprus, 2146 bales. In India, 4,718,000 bales were reported in 1928-29, and 4,680,000 in 1927-28, about 61 per cent of the two crops stapling under  $\frac{7}{8}$  inch.

The Egyptian crop was estimated by the International Institute of Agriculture at 1,641,900 bales, compared with 1,628,000 in 1928. Of this, the production of Sakellariadis was estimated to be 530,400 in 1929, and 526,000 the previous year. Up to Dec 1, 1929, 867,082 bales, of which 225,995 were Sakellariadis, had been ginned. Growers of lower Egypt have been turning from Sakellariadis to higher yielding varieties. Damage by bollworms and pink bollworm was about normal.

The U S S R (Russia) continued their programme of expanding cotton acreage in northern Caucasus, in Crimea, and in Asiatic Russia along the Siberia-Turkestan railway being constructed, the plans calling for 29,950 acres, compared with 5650 sown in 1928. About 2,559,000 acres, or 6 per cent less than the 1929 sowing-plan, were planted in cotton in Russia as a whole, compared with 2,289,000 in 1928. The 1929 production was estimated at 1,325,000 bales, 117,000 more than in 1928.

**CRETE** An island in the Mediterranean Sea, ceded to Greece after Aug 10, 1913. Area, 1327 square miles, population at the census of 1928, 386,427. Capital, Candia, with a population of 26,604 in 1928.

**CRICKET.** The annual competitions of the New York and New Jersey Cricket Associations and the Metropolitan District Cricket League served to keep the British game of cricket alive in the United States for 1929. A great help to the furthering of the game was again afforded by the tour of the Beninda cricketers, who played 18 games, of which they won 13 and drew five. The Brooklyn Cricket Club won the Metropolitan League championship, with the Fordham team in second place by a slim margin. The English team sent to Australia for the test matches was very successful, winning four matches out of the five played. The team played to a total of 785,000 spectators in these games. After the crushing defeat, the Antipodeans traveled to England with the victors. A South African team in England drew two matches out of five, while losing the other three.

**CRIME.** THE NATIONAL LAW ENFORCEMENT COMMISSION. In May, 1929, President Hoover announced the appointment of his long-heralded National Law Enforcement Commission. It will be recalled that, during the presidential election of the previous year, Mr. Hoover in his campaign address had stressed the necessity for the enforce-

ment of law as one of the major issues before the American people, and that, if elected president, he would appoint a commission to investigate the reasons for the breakdown of the law enforcement machinery. The appointment of the commission was the fulfillment of the pledge made then. George W. Wickersham of New York was appointed the chairman of the commission. Its other members were Frank J. Loesch, lawyer, of Chicago; Kenneth R. Mackintosh, lawyer and former judge, of Seattle; Henry W. Anderson, lawyer, of Virginia; William S. Kenyon, Federal judge, of Iowa; Ada L. Comstock, president of Radcliffe College; Paul J. McCormick, Federal judge, of Los Angeles; Newton D. Baker, lawyer and former Secretary of War, of Cleveland; Roscoe Pound, dean of the Harvard Law School; William I. Grubb, Federal judge, of Birmingham, Ala.; Monte M. Lemann, lawyer, of New Orleans.

All sections of the country were represented and three members—Baker, Grubb, and Lemann—were Democrats. In view of the fact that the commission, among the problems to be considered, was to give serious attention to Prohibition, it was interesting to note the wet or dry sentiments of the appointees. Charles Michelson of the New York *World* classified the following as dry: Kenyon, Loesch, Grubb, Mackintosh, McCormick, Anderson, the following as wet: Wickersham, Baker, Pound, and Lemann. Miss Comstock was put down as doubtful.

It was generally agreed by all groups that the commission was an exceedingly capable one. Up to October, the commission spent its time in the organization and appointment of committees and experts for the conduct of its investigations. The initial step was the division of the commission into a group of subcommittees under whose aegis the various inquiries were to be made and the reports written. There were created 11 subcommittees as follows: Subcommittee on Prohibition, with Mr. Wickersham as chairman; subcommittee on statistics of crime and criminal justice, with Dean Roscoe Pound as chairman; subcommittee on causes of crime, with Henry W. Anderson as chairman; subcommittee on police, with Frank J. Loesch as chairman; subcommittee on prosecution, with Mr. Monte M. Lemann as chairman; subcommittee on courts, with Judge William I. Grubb as chairman; subcommittee on penal institutions and parole, with Judge Mackintosh as chairman; subcommittee on juvenile delinquency, with Miss Ada L. Comstock as chairman; subcommittee on criminal justice and the foreign-born, with Newton D. Baker as chairman; subcommittee on lawlessness by government law-enforcing officers, with Judge William S. Kenyon as chairman; subcommittee on the causes of crime, with Judge Paul J. McCormick as chairman.

The plan called for the holding of open hearings by these subcommittees and the preparation of data and statistics by experts to be either employed or drafted for these tasks. Among experts already engaged before the October meeting were August Vollmer, former chief of police of Berkeley, Calif., expert on police; Prof. S. B. Warner, expert on statistics of crime and criminals; Alfred Betterman, Cincinnati, Ohio, expert in prosecution matters; Judge Joseph C. Hutcheson of Texas, expert on the operation of Federal Courts; Herman Adler, State criminologist for Illinois, expert in medical science relating to criminality; Prof. Edith Abbott of the University of Chi-

cago, expert on criminal justice among the foreign born; Walter M. Pollak of New York City and Prof. Zechariah Chafee of Harvard, to conduct studies in lawlessness by government law-enforcement officials.

While no formal reports were made during the year, the early announcement of Mr. Wickersham that the Federal Government might shift part of the Prohibition burden to the States was considered at large as being one of the important suggestions to be incorporated in the report of the subcommittee on prohibition enforcement. See PROHIBITION.

**HOMICIDE RATES.** The important researches of Dr. F. L. Hoffman of the Prudential Insurance Company have been cited before in these columns. Dr. Hoffman has carefully collected the number of homicides from the police officials in a large number of cities of the United States. His researches disclose that the murder rate per hundred thousand of population has doubled in the United States since 1900. The murder record for 1928 is approximately the same as in 1927, except that Detroit had moved into first place among the larger cities. The following were the homicide rates per hundred thousand of population among the greater cities of the country: Detroit, 16.5, Chicago, 15.8, Cleveland, 13.3; Philadelphia, 8.8, New York, 6.7, Los Angeles, 4.7. The composite rate for the six largest cities in the country was only 10 per hundred thousand against an average of 38.6 per hundred thousand for 10 Southern cities of considerably smaller size. Dr. Hoffman attributed the rising rate in Detroit to the increasing Negro population of that city. Chicago's homicide rate increased from 14.1 in 1927 to 15.8 in 1928. Thus, murders in Chicago are about 50 per cent in excess of the average for the country as a whole. They are, however, relatively less common in proportion to the population than in 80 cities.

The rates for the 10 Southern cities spoken of show an interesting contrast. In Memphis, the rate was 60.5 per hundred thousand, in Birmingham, it was 54.0, Jacksonville, 52.6; Atlanta, 45.1, Little Rock, 37.9, Macon, 35.9, Savannah, 31.0, Nashville, 27.9, Houston, 26.2, New Orleans, 25.9. The composite rate for these 10 cities was 38.6.

Dr. Hoffman is firmly convinced that the death penalty for murder is no deterrent. In fact, the 10 Southern cities all are located in States in which the death penalty is enforced rigorously. On the other hand, in these States, the carrying of firearms is common. Dr. Hoffman suggests the abolition of the death penalty and the creation of drastic regulations in the traffic of firearms. Of the death penalty, Dr. Hoffman writes: "The death penalty rather than the contrary acts as a deterrent to swift and adequate justice, imposes heavy burdens upon the taxpayers as the result of long trials, fosters sensationalism of the worst possible type, and stains the civilization of those who enforce it."

**SUICIDE RATE.** Dr. F. L. Hoffman, quoted above, also has made an analysis of the suicide rate in a number of the important cities of the country. His researches indicate that the suicide rate in 1928 was the highest on record since 1916. The rate in 1916 for 100 cities was 18 per hundred thousand, while for 96 cities in 1928, it was 17.5. It is interesting to note that in 1908 the rate was 21.5. Dr. Hoffman ventures the prediction that the suicide rate is tending upward. He says on

this score: "There are reasons for believing that in many respects present-day life is thoroughly unwholesome in all sections of the population which find it difficult to maintain a standard of life presupposing incessant anxiety and toil."

The 10 leading cities in the order of their importance as regards suicidal frequency in 1928 were the following: San Diego, 43.4 suicides per 100,000, San Francisco, 41.7, Tacoma, Wash., 34.4, Atlantic City, 32.9; Oakland, Calif., 32.8, Sacramento, 31.7, Seattle, 30.5, Terre Haute, Ind., 29.9, Denver, 23.9; Portland, Ore., 26.5. The following were the rates for the six largest cities in the country: Manhattan and the Bronx (N. Y.) 25.9, Los Angeles, 19.0, Chicago, 18.1, Detroit, 16.4, Philadelphia, 14.7, and Brooklyn, N. Y., 14.2.

Dr. Hoffman contrasts the American situation with those existing in a number of foreign countries. His report shows that Jamaica and the Irish Free State have the lowest rate of suicide per 100,000 persons of the population. The former has a rate of 1.5 and the latter a rate of 2.7. Austria has a rate of 21.2, Germany, 21.4, Switzerland, 22.6, Hungary, 22.8. The rate for the whole United States is 11.7. (The above figures were for the years 1924 and 1925.) In 1928, there were 5561 suicides in 97 American cities with a total population of 31,719,000, or a suicide rate for every 100,000 persons of 17.5.

**COST OF CRIME.** It was estimated by Wade H. Ellis of the American Bar Association's Crime Commission that crime costs the American people \$13,000,000,000 a year, that 12,000 murders were committed in America annually, and that 30,000 criminals were at large in New York and 10,000 in Chicago. Mr. Ellis' estimate of \$13,000,000,000 was based on losses sustained from robberies, costs of insurance, and the maintenance of penal institutions in the country. Mr. Ellis indicated the following outstanding causes for the great increase in crime in the country since the War: (1) The extraordinary growth in wealth which has made for wastefulness and extravagance. (2) The stupid increase of the number of laws. (3) The great increase in physical facilities which has made the commission of crimes and getaways more expeditious. Among such inventions have been the automobile, the automatic pistol, the machine gun, the smoke screen, and the airplane. (4) The increase in urban population. (5) The inefficiency of the judicial system in the matter of prompt and effective punishment of lawbreakers. (6) The lack of interest displayed by the public at large, which has been more concerned with the amassing of wealth and the creation of leisure-time activities.

Insurance experts sought to analyze a portion of the crime cost of the country from a study of surety company figures. According to one authority, burglary and theft cost the country \$215,000,000; forgery and fraud took an annual toll of \$125,000,000; and embezzlement cost \$125,000,000. This total of \$500,000,000, for these types of crime, represented both insured and uninsured losses. The public was paying annually \$85,000,000 for crime insurance, representing protection on more than \$15,000,000,000.

**AMERICAN BAR ASSOCIATION.** At its annual meeting in October in Memphis, Tenn., this organization accepted the report of its "Section on Criminal Law." In conjunction with this report, the following resolutions were adopted: (1) That there be available to every juvenile and

criminal court a psychiatric service (2) That no criminal be sentenced for any felony in any case where the judge has any discretion as to the sentence until a psychiatric report be filed. (3) That a psychiatric report be made on every prisoner before released (4) That each State establish a system of administrative transfer and parole and that no decision of a parole or transfer be made without a psychiatric report.

**NEW YORK STATE.** The Subcommittee of the New York State Commission on Causes of Crime continued during the year to issue a number of reports on juvenile delinquency, largely the work of Samuel Schulman, its director. One of the important reports of the year was an analysis of truancy, by an examination of the home status, housing, and educational abilities of 251 adolescent truants. The study shows that in the cases examined chronic truancy was in many instances the first step in a criminal career. It prefaces its conclusions with the following statement: "There is no doubt that present methods of dealing with crime among the youth of the city are wasteful of money and of careers. There is no doubt that the time to institute modern methods of child guidance is during childhood. There is no doubt that the school system is the place to begin the method." The report recommends the creation of psychiatric and habit clinics in the public schools. In such units should be attached psychiatrists, psychologists, physicians, vocational guidance experts, visiting teachers, and social workers, for the purposes of correlating school work with the educational and functional problems evidenced by backward students.

Continued experience with the Baumes Laws (to which reference has been made in previous YEAR BOOKS) has created a decided opinion in favor of radical modifications. Thus, Dr. Walter N. Thayer, Superintendent of the Institution for Defective Delinquents at Naponach, N. Y., before the October meeting of the State Crime Commission, urged the elimination of the arbitrary life sentence imposed on fourth offenders. In the opinion of Dr. Thayer, a criminal was not being deterred by the sentence that had no definite termination. In describing the work of his own institution, Dr. Thayer declared that Naponach was being overtaxed. This plant had a capacity for only 490 and at the time of the meeting was harboring 737 inmates. The low class of mental defectives was increasing at Naponach with constructive rehabilitation work among the higher type of prisoners. A concrete suggestion made was the creation of a central receiving institution for all types of criminals, both mental defectives and delinquents, where a sorting process might be made for distribution of the offenders to proper institutions.

Schemes for the segregation of defectives from criminals were before the public attention a number of times during the year, particularly in New York City, where definite thought was being given to the establishment of crime clinics. Richard C. Patterson, Jr., Commissioner of Correction, in his annual report, called for the making of a study for two years on a budget of \$150,000 to investigate 2000 offenders for the purpose of singling out those mental defectives who needed medical care, rather than incarceration in penal institutions. Mr. Patterson's report cited the fact that there were 10,809 prisoners committed to the city penitentiary on Welfare Island during 1928-29, of whom 3443 were second offend-

ers; 1587 third offenders, 872 fourth offenders; and 525 fifth offenders. It appeared that the city was being burdened particularly with short-term offenders upon whom imprisonment evidently made no impression. It was estimated by the Department of Correction that annually 15,000 men and women go to jail in New York for 10 days or less and 10,000 for 3 days or less.

The problem of the mental defective is probably more serious than is that of the habitual offender whose delinquencies can be handled more expeditiously and effectively than by short jail sentences. Mr. Patterson declared that, of the 10,890 prisoners at the penitentiary on Welfare Island in 1928, 6245 were physically or mentally defective. Mr. Patterson's report states: "It has been the practice of many years' standing to use the penal institutions of the department as dumping grounds for the physically and mentally unfit. Many of these, through motives of humanity, not to mention the practical side, should have been sent to hospitals or to some other institution where they can have custodial care more suited to their needs which of course a penal institution cannot supply." The proposed crime clinic in New York was to attempt to separate exactly such offenders. The situation can best be treated by medical and hospital care, rather than confinement in penal institutions.

**NEW YORK CITY.** Police Commissioner Grover A. Whalen of New York City, in a report of his department for the six months ending June 30, 1929, indicated that there had been sizable reductions in crime in New York City, as compared with the same six-months' interval for 1928. Crimes of violence, i. e., murder, robbery, felonious assault, and burglary had been reduced 8½ per cent, felonies had been reduced 12½ per cent, burglary and robberies had been reduced 70 per cent. In 1928 insurance companies had paid losses for 2250 burglaries and robberies, as compared with 928 for the same period in 1929. In the analysis of murder and manslaughter cases, the commissioner showed that 92 of the total of 160 of these crimes were crimes of passion and therefore, as far as police action is concerned, not preventable. The commissioner's report contained the following statement, which is generally conceded to be true by experts of crime: "It is a remarkable tribute to the efficiency of our police that there is no commercialized prostitution and the uncontradicted statement may be made that New York City has less open vice than any other large city in the world. Professional gambling is at a minimum in the city. Virtually, the only games of chance that operate are forms of gambling that may run a few hours nightly in cellars or other obscure places in the city. The persons conducting such games are compelled to secure new locations daily, due to the vigilance of the Police Department." The commissioner's report further disclosed that, during the first six months of the year, there had been 20,386 complaints of crime made to the police. A total of 7193 arrests had been made in these cases up to the time of the compiling of the report. During the same period, the estimated value of thefts, excluding stolen automobiles, was \$4,411,098, and, of this amount, 22.8 per cent had been recovered by the detectives. The number of automobiles lost or stolen was 5150, of which the police regained 4091. Of the 180 homicides, arrests were made in the cases of 105. As was said, 92 homicides were due to family troubles or unfortunate love affairs, 9 were com-

mitted during the commission of felonies, 7 were gangster killings, and 5 were as the result of gambling disputes. Of the 105 arrests for homicide, convictions had been obtained in the cases of 13, and in the corresponding period for 1928 convictions were obtained in 33 of the 108 cases where persons had been arrested for murder. Homicides, listed officially as unsolved, numbered 25 in 1929, as against 36 for the same six-months' period in 1928.

ILLINOIS. There was published during the year the results of the Illinois Crime Survey, made for the most part in Cook County by a group of experts under the direction of the Illinois Association for Criminal Justice. The report indicated that the large number of homicides occurring in Chicago was due to gang warfare resulting from attempts by well-organized gangs to create monopoly districts for the control of the liquor and gambling privileges. In 1928 and 1927 in Cook County (in which Chicago is located), there were 130 gang murders and for these not one man was punished. The largest percentage of the Chicago killings was committed in those districts inhabited by Negroes and Italians. Although the Negro population of Chicago is only 5 per cent of the whole, approximately 28 per cent of the murder victims were colored and 30 per cent of all persons killed by the police were colored. In the Italian districts were committed 74 of the gang killings, a percentage far out of proportion to the ratio of population.

The chapters devoted to organized crime, written by John Landesco, trace the careers of important gang leaders and the evolution of gang activities. The report detailed at length the character of the truces declared by the gangs to map out the city for the peddling of bootleg whiskey, the extent of the organization of one of the major syndicates with its annual income of \$2,000,000, the technique of bombing, etc. Another chapter of the survey, made by Chief of Police Vollmer, of Berkeley, Calif., indicated that there were vital defects in police administration and that the police force's demoralization was to a large extent due to lack of support by prosecuting officers and attorneys and the shifting of administrative officials at recurrent elections.

Analyses of criminal prosecution were made by William D. Knight, John J. Healy, and Raymond Moley. According to one of these experts, responsibility for failure to convict the guilty lies 10 per cent with the courts, 20 per cent with the police, and 70 per cent with the prosecution. Mr. Moley, in presenting his two hypotheses that too many innocent persons are being arrested or that too many guilty persons are escaping punishment, cited the following figures: Out of the total number of robbery charges in the year 1926 brought to trial, 1788 cases were discharged without punishment, 719 were reduced to lesser offenses, 30 were still pending, 1 was declared insane, and only 151 were convicted of robbery. Of the 12,543 felony cases in Chicago in 1926, only 2449 were found guilty of any offense and, of this number, only 594 were convicted of the offense charged. Mr. Moley makes the recommendation in this portion of the survey that judges must be taken out of politics.

Throughout all the chapters of the survey are to be found constant references to the effect of political control on the administration of justice, of the work of the "fixer," of the especially privileged, and of the incompetency and corruption of

public officials. Other experts who contributed sections to the report were C. E. Gehlke, "The Disposition of Felony Cases"; Bruce Smith, "Rural Police Protection"; Arthur V. Lasky, "Homicide"; and Albert J. Tarno, "The Supreme Court in Felony Cases."

PRISON OUTBREAKS. The year witnessed a series of five desperate outbreaks on the part of prisoners in New York, Colorado, and Kansas jails that resulted in bloodshed and death. The first took place on July 22 at the Clinton Prison at Dannemora, N. Y., where 1300 prisoners set fire to a lumber shed, a carpenter shop and a weaving shop. After a battle of five hours, the rioting prisoners were subdued by guards. Three convicts were slain. The second mutiny took place at Auburn prison, also in New York State, on July 28. Here, the prisoners seized riot and machine guns from the guards, shot down four of them, and fired most of the workshops in the prison walls. Four of the leaders of the riot escaped in automobiles, two were killed and eleven were wounded. When 1929 closed, two of the escaped convicts were still at large. The Auburn rioters had hoped to effect a general release by setting fire to the prison, and when local fire companies appeared on the scene the prisoners attempted to interfere by hacking the fire hose with axes. The mutinying convicts did not surrender until the appearance of State troopers with machine guns.

Early in October, in the Colorado State Penitentiary at Canyon City, Colo., there occurred a riot that lasted for seventeen hours and that did not end until seven guards and six convicts were slain. The mutiny began when a band of five convicts produced revolvers and captured fourteen of their guards, whom they held as hostages to guarantee safe conduct through the prison. Four guards were slain and their bodies hauled into the prison yard, when the warden of the jail refused to comply with the prisoners' ultimatum. The cell block, in which the rioters had taken refuge, was finally exposed to machine-gun fire as the result of the explosion of a charge of dynamite placed by the prison priest. The leader of the mutineers, realizing the hopelessness of the situation, then coolly lined up his followers, and, having shot them, killed himself.

On August 1, the 3700 convicts in the Federal jail at Leavenworth, Kan., broke out into mutiny. In this outbreak, none of the jailers was killed, but one of the prisoners was fatally wounded.

The most desperate mutiny of them all occurred at Auburn, N. Y., December 11. Here, a band of fifty convicts, held in solitary confinement for their part in the earlier riot of the summer, made a mad bid for freedom while they were being marched to the prison yard for their morning's exercise. As in the Colorado jail, the convicts seized the warden and a group of guards to be held as hostages. For six hours, the band of mutineers terrorized the prison. They did not surrender until they were charged by State troopers and militiamen, who used gas bombs and gunfire. The warden and five of the captive guards were rescued as they fell, overcome by the gas fumes. The dead included the principal keeper of the prison and eight of the convicts. The injured included six guards and three convicts. In all these bloody efforts on the part of the prisoners to gain their freedom, observers were able to discern the following causes at work. (1) The prisons were overcrowded. (2) The food was bad. (3) The prisoners did not have enough work to do.

(4) The new rigorous laws, making for long terms and for the slowing down of the machinery of parole, had destroyed hope among the prisoners that good conduct might lead to a lightening of their sentences.

That there was considerable justice in the demands of the rioting prisoners was indicated when President Hoover, in August, following the outbreak at Leavenworth, announced that he had decided to ask for an additional \$5,000,000 from Congress to enlarge the four existing government penal institutions and for the erection of a new prison in one of the northeastern States. The President's statement declared that overcrowding had led to a state of "infinite demoralization" that in many instances had caused "trouble and outbreaks" among the inmates. The President showed that Atlanta was 120 per cent over capacity and Leavenworth 87 per cent. There were to be found similar conditions of overcrowding in the prison at Chillicothe, Ohio, and at McNeill Island Prison (State of Washington).

**CRITICISM.** See LITERATURE, ENGLISH AND AMERICAN, FRENCH LITERATURE, GERMAN LITERATURE, ITALIAN LITERATURE, SCANDINAVIAN LITERATURE, SPANISH LITERATURE, ETC.

**CROATIA** (krô-â'sli-a) AND **SLAVONIA.** Since 1918 a province of the new State of Yugoslavia, formerly a crownland of the Austro-Hungarian Empire, extending from the Adriatic Sea to the Danube River. Area, Jan 31, 1921, 16,920 square miles, population on the same date, 2,739,593. Capital, Zagreb or Agram, with a population in 1921 of 108,338 (estimated in 1927, 130,000).

**CROATS.** See YUGOSLAVIA

**CROPS.** See AGRICULTURE and articles on various crops such as CORN, OATS, TOBACCO, WHEAT, ETC.

**CROSS-COUNTRY RUNNING.** The national cross-country championship of the United States was won for the second time in succession in 1929 by Gus Moore, Pittsburgh University student, running under the colors of the Brooklyn Harriers Association. The national team title was garnered by the Dorchester, Mass., Club James McDade of New York City captured the national ten-mile race on Thanksgiving Day, while the marathon event was taken handily by John C. Miles of Hamilton, Ont.

The Pennsylvania University team gained the Eastern Intercollegiate honors, usurping the laurels held by Penn State College for three years. The individual eastern college championship was taken by two runners from the University of Maine, Harry Richardson and Francis Lundeau, who finished in a dead heat for first place in the event at Van Cortlandt Park, New York City. In the Western Conference, Orval Maitin captured the individual honors for Purdue, while Indiana gained the team honors.

**CRUISERS.** See VESSELS, NAVAL.

**CUBA.** A republic of the West Indies consisting of the large island of the same name, the Isle of Pines, and small adjacent islands. Capital, Havana.

**AREA AND POPULATION.** The area is 44,164 square miles of which 41,634 are for the island of Cuba, 1180 for the Isle of Pines, and 2350 for the other islands. According to figures furnished by the Director of the Census Bureau, the population of Cuba on June 30, 1928, was 3,579,507 (including 82,297 immigrants), distributed by provinces as follows.

Province	Inhabitants
Pinar del Rio . . . . .	301,001
Havana . . . . .	1,081,514
Matanzas . . . . .	347,552
Santa Clara . . . . .	755,027
Camaguey . . . . .	258,712
Oriente . . . . .	885,697

In 1928 there were 17,469 marriages, 58,387 births, 6008 still-births, and 41,751 deaths.

The city of Havana had 581,076 inhabitants in 1928, being the only city in the Republic whose population was over 100,000. Other important cities and the populations, including suburbs, are Cienfuegos, 72,919, Camaguey, 92,073, Manzanillo, 60,544, Santiago de Cuba, 73,800, Guantánamo, 52,598, Santa Clara, 69,200, and Sancti Spiritus, 86,418. There is a large transitory immigration yearly consisting largely of Spanish laborers who return to Spain after the harvest season.

**EDUCATION.** Primary instruction is free and compulsory between the ages of 6 and 18. The public-school system was developed under American supervision after the passage of the Education Act of 1899. According to statistics compiled by the Division of statistics, there were, in the year ending June 30, 1928, 449,478 children enrolled in the 6952 elementary schools, which had 7350 teachers. There were also 70 traveling teachers who taught 3324 pupils, 84 night schools for working people with 8377 pupils. There were also 525 private schools with 1668 teachers and 31,949 pupils. There is a special institute for advanced instruction in each province, and annexed to each is a normal school for the training of teachers. University instruction is provided by the University of Havana, which was founded in 1721 and had 4148 students in 1927-28.

**PRODUCTION.** The economic condition of Cuba is dominated by the price of sugar, which, with its by-products, comprises over 80 per cent of the total exports. The island is the world's largest sugar producer. Tobacco and its products account for about 12 per cent of the exports. The country is essentially agricultural, other products being cacao, cereals, coffee, potatoes, and fruits. The dominant position of sugar dates from 1914 when the dislocation of the European beet industry during the World War and the resultant heavy demand for sugar caused a rapid increase in the Cuban output, accompanied by heavy investments in railroad and other facilities necessary to this expansion. Commerce and industry grew correspondingly until the severe depression of 1921. The industry did not recover from this slump. Although exports were greater in 1925 and 1926 than in 1920, the price and total value of exports steadily declined after 1924, except for a temporary improvement in 1927.

With the progressive restoration of the beet industry in Europe and the continued growth of production in Cuba and other countries, the industry was faced with surplus supplies which accounted for the low prices of recent years. Cuba's production of sugar nearly doubled since 1912, while production in other sugar-producing areas increased even faster, so that Cuba's share of the total world production declined from a high point of over 25 per cent in 1918-19 to less than 16 per cent in 1928. Consumption in the United States, Cuba's chief market, did not keep pace with the supply, the imports from Cuba increas-

ing only from 1,925,000 long tons in 1913 to 3,259,000 tons in 1927. Government restrictions on production, which reduced the output from 5,126,000 tons in 1924-25 to 4,500,000 tons in 1926-27, and 4,000,000 tons in 1927-28, did not result in the hoped-for increase in prices. In 1928-29 government control was withdrawn and sugar production established a new record of 5,135,000 tons, but prices dropped lower than for years and the income from the crop was much less than that received from other previous crops of much lower tonnage.

The 1929-30 sugar-grinding season opened Dec 15, 1929, with an estimated crop of 4,545,480 long tons to dispose of. A cooperative export agency was created in 1929 to market the entire crop and was given authority to restrict all sales in an effort to stabilize prices.

The depression in the sugar industry is reflected in the general business conditions in Cuba, which have been badly depressed since 1924. In 1927 the Government adopted a drastic protective tariff policy and in the following year inaugurated a national movement for the expansion and diversification of agriculture and industry. By the end of 1929, the expansion of coffee, corn, and rice culture, and the increased production of dried beef, dairy products, and of leather, garment, wood, and metal manufactures were reported by observers as the fruits of these measures. The export trade in tobacco has been steady in quantity but values have been higher in recent years. In 1928, 46,020,000 pounds, valued at \$27,846,000, were exported, of which the United States took \$20,086,000 worth. Exports in 1927, \$25,556,000, to the United States, \$20,377,000. Livestock in the country in 1929 included 4,572,307 cattle, 642,194 horses, 82,273 sheep and goats, and 3233 mules.

Cuba's forest lands, 1,250,000 acres of which belong to the state, contain valuable cabinet woods. Considerable mahogany is exported. Iron ore, copper, manganese, and gold are mined.

Cuban fisheries made a notable advance in 1928, their production reaching 12,405,574 pounds, valued at \$1,927,208, or an increase of \$601,992 over the preceding year. Imports of salt fish dropped in proportion.

COMMERCE Cuba's foreign trade continued its downward trend in 1928, the value of combined imports and exports dropping to \$489,988,027, the lowest level since 1915, according to preliminary figures of the Cuban Treasury Department. This represented a decrease of \$91,763,741, or 16 per cent, from the 1927 total. Exports for 1928 were valued at \$278,009,689, as compared with \$324,367,706 in 1927, a decrease of 14 per cent. The total value of imports was \$211,918,338, a drop of \$45,405,724, or 18 per cent, from 1927. The fluctuations in Cuba's foreign trade from 1913 to 1928 are shown in the accompanying table.

Cuban exports to the United States in 1928 decreased by \$53,607,532 and represented 73 per cent of the total exports, as compared with 79 per cent in 1927. Imports from the United States dropped \$29,117,546 and constituted 60.8 per cent of the total, or about 1 per cent less than in 1927. Exports to the United Kingdom were \$45,325,499 in 1928, recording a substantial increase for the third consecutive year. Spain, France, and Germany also increased their purchases from Cuba. Imports from all the major countries were less than in 1927. In 1928 the

1928 . .	211,918	128,938	278,070	202,535

United Kingdom supplied 46 per cent of Cuba's imports, Germany, 31 per cent, and France, 45 per cent. The rapid growth of the United States export trade with Cuba from 1913 to 1920 and its equally rapid decline since that date can be attributed almost entirely to the rise and fall in the value of Cuban exports of sugar. In 1929 both imports from the United States and exports to that country moved upward in a mild reaction from the low levels of 1928, although in the last quarter of the year trade with the United States fell off as compared with the previous year. Total exports of sugar in 1929 amounted to 4,771,211 tons (4,011,098 tons in 1928), of which 3,070,455 tons went to the United States (2,902,552 in 1928). The price of raw Cuban sugar on the New York market averaged 2 cents per pound in 1929, as compared with 2 1/2 cents in 1928, 2 1/2 in 1927, and 5 1/2 in 1923. Exports of tobacco in 1929 were valued at \$37,878,705.

FINANCE The financial operations of the Cuban government reflected the economic depression. Revenues were increased from \$80,345,000 in 1927 to \$81,972,000 in 1928 largely through increases in the import duties, the progressive extension of internal taxes by administrative means and decrees, and a drive for overdue taxes. Despite higher duties, customs receipts in 1928 were only \$38,713,873, or \$3,564,863 less than in the previous year. Including the expenditure of borrowed money, it was estimated that the national Government, the provinces, and the municipalities spent upward of \$150,000,000 during 1928. Much of this went toward public improvements. By January, 1929, the Government had borrowed \$20,000,000 by special arrangement with New York bankers for the more rapid construction of public works. This programme was designed to counteract the effects of the business depression.

The final budget for 1929-30 estimated receipts at 85,450,000 pesos (1 peso equals \$1 at par) and the ordinary administrative expenditures at 67,686,881 pesos. Payment from the fixed budget of an additional 17,705,269 pesos for the services of the foreign and internal debts and certain administrative charges brings the total estimated expenditures to 85,392,151 pesos.

The chief items under ordinary administrative expenditures were Department of State, 1,850,722 pesos; Government, 4,733,045 pesos; Treasury, 6,776,978 pesos; Agriculture, Commerce, and Labor, 1,190,038 pesos; Public Works, 4,227,777 pesos; Public Instruction and Fine Art, 15,737,281 pesos; Sanitation and Charity, 5,649,947

pesos; War and Navy, 12,734,324 pesos, Communications, 5,355,680 pesos; special veterans' fund, 7,336,360 pesos. Chief revenue items were customs, 41,128,000 pesos; land taxes, 28,431,500 pesos; loan taxes, 5,600,000 pesos; national lottery, 4,250,000 pesos; transportation taxes, 2,690,500 pesos. The total funded debt stood at about \$110,000,000 in February, 1929, as compared with \$93,000,000 in February, 1928.

Tourists were estimated to have expended \$20,000,000 in Cuba during the winter of 1928-29, an increase of \$4,000,000 over the previous season.

**COMMUNICATIONS.** In 1928 Cuba had 2482 miles of railroad line, exclusive of some 3000 miles of private railways owned by sugar companies. In the same year, there were 1739 miles of highway. Additional provision for the more rapid construction of Cuba's extensive public-works programme was made in 1929 when a contract for financing the work to the amount of \$60,000,000 was made with an American bank. The programme includes the completion of the Cuban Central Highway, said to be the most important road-construction project in the world. It extends 702 miles from Pinar del Rio on the west to Santiago in the east and connects Havana with most of the important cities of the island. The total cost is estimated at \$76,000,000. In September, 1929, the highway was 40 per cent completed.

In 1927 there were 12,231 miles of telegraph wire and 65,216 telephones in use. An air-mail and passenger service between the United States and Cuba was inaugurated in January, 1929. During 1928, 6500 vessels, with a total tonnage of 21,486,978, anchored in Cuban ports.

**GOVERNMENT.** Executive power is vested in a president and cabinet, and legislative power in a congress of two houses, viz., a senate with 24 members and a house of representatives with 118 members. President in 1929, General Gerardo Machado y Morales, inaugurated May 20, 1929, for his second term, which expires May 20, 1935.

**HISTORY.** Critics of the Machado régime for alleged violation of the constitutional rights of the President's political opponents and of foreigners resident in Cuba found repeated expression in both Cuba and the United States during 1929. In the United States, the discussion centered in the case of Joseph E. Barlow, an American citizen, who had made a claim for \$9,000,000 against the Cuban government for the alleged confiscation of his property. On August 27, he was arrested and imprisoned in Havana on a charge of grand larceny. Securing his release on bail the next day, he submitted the matter of his arrest to Secretary of State Stimson. His financial claims against the Cuban government had been filed with the United States State Department more than a year before. The evidence in this case as presented before the subcommittee of the Foreign Relations Committee on May 14, 1928, was made public in Washington Sept. 2, 1929. The testimony revealed that Daniel Dunning, counsel for Barlow, had charged President Machado before the committee with cabling the Cuban Ambassador at Washington on May 7, 1928, "asking him to use \$500,000, or any sum of money, to control the press so that there would be no adverse reports," on the Senate committee's inquiry into the Barlow case. On September 5, Mr. Barlow filed an affidavit with the State Department, giving a harrowing account of his alleged treatment by Cuban prison officials. On

September 25, Secretary of State Stimson and other officials of the State Department discussed the claims of American citizens against the Cuban Government before the Senate Foreign Relations Committee.

These events followed the publication in mid-April by the Foreign Policy Association in the United States of a survey of alleged repressive methods adopted by the Cuban government. Special reference was made to the responsibilities of the United States under the Platt Amendment. The Cuban Ambassador at Washington, on April 16, issued a statement declaring that a "campaign of defamation" was being conducted against Cuba in the United States.

Four Associated Press newspapers in Havana came to the defense of President Machado in a joint statement issued in New York September 19. They asserted that the Cuban press was free, the country making rapid progress, that life and property were safe, and that "far from maintaining a dictatorship, President Machado has won the esteem of the Cuban people."

Dr. Rafael Iturralde, former Governor of the Cuban province of Matanzas, issued a statement in reply in New York, on September 21, denying that freedom of the press existed in Cuba, he named four editors whom he said had been assassinated "under mysterious circumstances after campaigns unfavorable to the government."

"No one can deny," Dr. Iturralde said, "that Machado reelected himself without opposition, that no election has been held for Congressmen now holding office, and that hundreds of citizens have been murdered while widespread terrorism prevails. The reports of the American Federation of Labor and the Foreign Policy Association are definitely conclusive on these points."

Cuban officials arrested 10 men in Havana February 27 and charged them with plotting to assassinate President Machado and bring about the intervention of the United States. On October 18, four arrests were made in connection with an alleged conspiracy against the Government and 14 other persons, including several former Senators and cabinet members, were said by the police to have been implicated. Col. Carlos Mendieta, a former Deputy of the Nacionalista party, who was leader of the group, said after his release on bail that he and his associates would continue to oppose the Machado régime "until total restoration of public liberties, with all the legal arms provided." In connection with the campaign of the Cuban police against aliens who cause unrest, 23 Asiatics were deported under a decree signed by President Machado on November 16.

In December, President Machado's name was brought into the investigation which the United States Senate conducted into lobbying activities of the Cuba Company, an American company with large sugar holdings in Cuba, in connection with its efforts to prevent a proposed increase in the American tariff on Cuban sugar. In a letter to Herbert C. Lakin, president of the Cuba Company, which was read into the record, President Machado was quoted as saying that the proposed tariff increase would destroy the economic power of the island and reduce it to the condition in which it was when Cuban independence was first obtained.

**CULIN, (ROBERT) STEWART.** An American anthropologist and museum curator, died in Brooklyn, Apr. 8, 1929. Born in Philadelphia,

Pa., July 13, 1858, he attended Nazareth Hall Academy, Nazareth, Pa. He traveled extensively in the Orient, in India, and among American Indians, often living with the natives in order to study their dialects and customs. After directing the department of archaeology of the University of Pennsylvania, 1892-99, he became curator of the section of American and general ethnology of the Free Museum of Science and Art, Philadelphia, 1899-1903. Appointed ethnologist of the Museum of Brooklyn Institute of Arts and Sciences in the latter year, he remained with that institution until his death, always trying to reconstruct for the visitors the daily activities of the ancient peoples whom his curios represented. Making an especial study of the games and sports of various civilizations, Mr. Culin wrote extensively on these and other subjects from an anthropological point of view. His books include *Korean Games* (1896), *Chess and Playing Cards*, and *American Indian Games* (1905).

**CULTURE, ANCIENT** See ANTHROPOLOGY  
**CUMBERLAND PRESBYTERIAN CHURCH.** A branch of the Presbyterian Church, originally the Cumberland Presbytery of Kentucky. It was formed in 1810, when the so-called anti-revival party of the church objected to the admission into the ministry of men who were not up to the usual literary and theological standards and to the doctrine of fatality as taught in the third and tenth chapters of the Westminster Confession of Faith. Its chief strength was in the Southern States, in consequence of which it was barely saved from disunion during the slavery dispute at the time of the Civil War. This situation led to the establishment of the Colored Cumberland Presbyterian Church. A general assembly which meets annually is the supreme judiciary. In 1929 the denomination comprised 10 synods and 61 presbyteries, and there were 1189 churches, reporting 736 ministers, and a church membership of 64,767. The Sunday-school enrollment was approximately 52,250. The property of the church was valued at \$3,968,868, not including \$500,000 endowment for education.

Missionary work was carried on among the Indians in the United States and churches were maintained in China, where there was an organized presbytery in Canton with nine churches in South China. During the year, mission work was opened up in South America. The denomination carried on educational work under the direction of the board of education and maintained Bethel College and the Cumberland Presbyterian Theological Seminary, both in McKenzie, Tenn. *The Cumberland Presbyterian*, published in Nashville, Tenn., is the official organ of the church. The 1929 national meeting was held in Princeton, Ky., and the 1930 meeting was announced for May 15-21 in Olney, Tex. The Rev. H. C. Walton, M. A., B. D., Birmingham, Ala., was moderator of the general assembly, and the Rev. D. W. Hooks, Paducah, Ky., was stated clerk and treasurer.

**CUMBERLAND PRESBYTERIAN CHURCH.** Colored A branch of the Cumberland Presbyterian Church which was legally set apart as a separate unit in 1869. The membership of 178 churches of the denomination for which figures were given in the United States census of religious bodies of 1926 was 10,868, as compared with 136 churches and 13,077 mem-

bers in 1916. In 152 churches reporting Sunday schools, there were over 5000 pupils and 840 officers and teachers, as against 7471 pupils and 928 teachers and officers in 1916. The total expenditures of 167 churches in 1926 amounted to \$80,304, of which \$70,437 was for current expenses and improvement and \$9867 for benevolences, missions, etc., while 127 churches reported total expenditures of \$39,497. The value of church edifices, including furniture and equipment, as reported by 162 churches, was \$353,825 in 1926, as compared with \$230,426 reported by 130 churches in 1916. Of the 178 churches reporting in 1926, 60 were in urban communities and 118 in rural districts.

**CURACAÛ,** kûr'ra-sh'û A Dutch colony in the West Indies consisting of two groups of islands about 600 miles apart, one of them comprising the islands of Curacao, Bonaire, and Aruba, and the other consisting of the southern part of St. Martin (the northern part belongs to France), St. Eustache, and Saba. Area, 403 square miles, population, Dec. 31, 1927, 61,479, of whom 41,014 were on the island of Curacao. The capital is Willemstad, on the island of Curacao, with a population of 19,061. In 1927 there were 54,200 Roman Catholics, 6351 Protestants, and 509 Jews. The registered movement of population in 1927 was: Births, 1849, deaths, 1057, marriages, 516. In the same year, there were 41 schools with 9064 pupils. The chief products of the colony are maize, beans, pulse, cattle, salt, and phosphate of lime. The chief industry is oil-refining. The crude oil is imported from Venezuela and Mexico. In 1927, the imports were valued at 142,238,750 guilders and the exports, 134,583,894 guilders, 8045 vessels of 25,148,479 tons entered the ports of the colony in 1927. In 1929 the budget revenue was estimated at 5,464,500 guilders and the expenditure at 5,303,689 guilders. The colony is administered by a governor aided by a council and a colonial council, the members of both being nominated by the sovereign Governor during the greater part of 1929, K. L. A. Fruvter, appointed Oct. 27, 1928. He resigned following a raid made by Venezuelan insurgents on the Governor's palace at Willemstad June 9, 1929, in which he was made prisoner. The insurgents then forced the commander of the American ship *Maracibo* to take them and their hostages to Coro, on the Venezuelan coast. On Dec. 2, 1929, Major Van Slobe of the general staff of the Dutch Army was named to succeed Fruvter. See VENEZUELA.

**CURLING.** Canada regained possession of the Gordon International Medal in 1929 when the Canadian teams decisively defeated the United States representatives on the Montreal ice, 405 to 372. The Dominion thus took the trophy for the fourth time in five years, the Americans having triumphed in 1928 at Utica, N. Y.

**CURRENCY.** See COINS, VALUE OF FOREIGN, FINANCIAL REVIEW, MONEY, UNITED STATES.

**CURTISS,** RALPH HAMILTON American astronomer, died in Ann Arbor, Mich., Dec. 25, 1929. He was born in Derby, Conn., Feb. 8, 1880, and was graduated from the University of California in 1901, receiving the degree of Ph.D. there in 1905. He was assistant astronomer at the University of California Observatory in 1900, and in 1901 was a member of the Luck Observatory Eclipse Expedition to Sumatra. During 1901-04 he was a fellow of the Luck Observatory and a Carnegie assistant there in 1904-05.

After two years (1905-07) as astronomer in the Allegheny Observatory, he entered the University of Michigan as assistant professor of astronomy (1907-11), and was promoted to associate professor in 1911, and after 1918 to professor. In 1927 he became also director of the Detroit Observatory. Professor Curtiss's principal field of investigation was the properties of stars having bright-line spectra in Classes B to A of the Draper classification. He wrote many scientific papers, especially in stellar spectroscopy.

**CUSACH-SMITH**, Sir BERRY British Consul, died in Horsaam, Sussex, July 7, 1929. He was born Feb. 16, 1859, in Dublin, Ireland, and was educated at Eton. He became a barrister at the Middle Temple in 1884, and in 1890 was sent as British consul to Samoa and deputy-commissioner for the Western Pacific. In 1892 he was deputy-commissioner for the Tokelau Islands and acting British resident, and in 1893 special judicial commissioner. With the consuls of Germany and the United States, he acted as adviser to the King of Samoa, and from 1893 to 1897, he was receiver and custodian of the revenues of Samoa and president of the municipality of Apia. He was consul in 1898. He was chargé d'affaires in 1900-02 and consul general in 1903-04. With the rank of colonel, he commanded the Territorial Field Artillery in India and Mesopotamia during the World War, from which he was invalided home in 1917.

**CUST**, Sir LIONEL English author and art critic, died in Windsor, England, Oct. 12, 1929. He was born in London, Jan. 25, 1859, and was educated at Eton and Trinity College, Cambridge. In 1882 he entered the War Office, but two years later became assistant in the department of prints and drawings of the British Museum. From 1893 to 1909, he was director of the National Portrait Gallery, and after 1909 director of the National Gallery. He was also surveyor of the King's pictures and works of art from 1909 to 1927, and joint editor and director of the *Burlington Magazine* from 1909 to 1919. He was made a Knight Commander of the Royal Victorian Order in 1927. Sir Lionel was better known as an art historian than as a critic. His books include *Index of Artists Represented in Department of Prints and Drawings in the British Museum* (part 1, 1893, part 2, 1896), *Albrecht Dürer: A Study of His Life and Art* (1897), *The Masters "E.S."* and the *Ars Moriendi* (1898), *A History of Eton College* (1899), *Van Dyck's "Chalworth" Sketch Book* (1901), *Anthony Van Dyck* (1903), *Anglo-Babylonian: A Story of Modern Venice* (1904), *The Bridgegate House Gallery* (1904), *The Royal Collection of Paintings, Buckingham Palace* (1905), *Eton College Portraits* (1909), *Notes on Pictures in the Royal Collections* (1911), *History of the Society of Dilettanti* (1898, 1914), *Jerusalem* (1924), *Memoir of Sir John Cusack, Bt., Speaker of the House of Commons* (1927).

**CYCLING** In 1929, by far the most active season in the history of the sport, Franco Georgetti, the little Italian star, was the outstanding cyclist. Georgetti was not only the motor-paced championship of America, but also won three six-day races, those in New York in March and December, and that in November at Chicago. His victory in the motor-paced event was his third in as many years.

For the sixth consecutive year, Cecil Walker of Australia won the all-around championship of America, besides winning more races than any other rider in the United States. Freddie Spencer captured the American sprint championship for the second successive season, while Lucien Richards of France conquered a fine field to win the world's sprint title for the third time in a row. George Paillard, also of France, won the motor-paced crown, while Anton Mazurac of Holland was awarded the amateur championship of the world. Sergio Matteni of New York took the amateur road title, as well as the amateur track championship.

**CYCLONES.** See METEOROLOGY.

**CYPRUS** A British island, situated 40 miles from the coast of Asia Minor and 60 from the coast of Syria, the third largest island in the Mediterranean Sea. Area, 3,584 square miles, population according to the census of 1921, 310,709, of whom 61,422 were Mohammedans. In 1927 births registered numbered 8,586, deaths, 5,328. Capital, Nicosia, with a population of 18,579. In 1927 there were 908 elementary schools with 1295 teachers and an enrollment of 46,677, of whom 36,384 were Greek Christians. With about one-third of the arable land under cultivation, agriculture forms the chief occupation of the people of the island. Forestry and the cultivation of the vine are rapidly taking an important place in the production of wealth on the island. Among the principal products are wheat, barley, oats, wine, olive oil, cotton, animal products, and fruit. Asbestos and iron are mined and exported in considerable quantities.

The merchandise imported in 1927 was valued at £1,585,306, exported £1,742,870. The revenue for the same year was £655,997 and the expenditure, £615,029. The total shipping which entered and cleared amounted to 1,746,757 tons in 1927. The island was administered under a convention with Turkey by Great Britain after June 4, 1878, and was annexed by Great Britain at the outbreak of the war with Turkey on Nov. 5, 1914. It is under a high commissioner having the usual powers of a colonial governor, aided by an executive council and a legislative council of 24 members of whom 9 are office-holders and the remainder elected for five years: 12 of them by non-Mohammedan voters and 3 by Mohammedan voters. On May 1, 1925, the island was given the status of a colony. Governor during 1929, Sir Ronald Storrs. See ARCHEOLOGY.

**CYRENAICA** A colony belonging to Italy on the north coast of Africa, until 1919 it formed a part of Libya. In that year for administrative and military purposes, Libya was divided into Cyrenaica and Tripolitania (See TRIPOLITANIA). The area is estimated at about 285,640 square miles including the hinterland zone of Cufia, population, according to the census of 1926, about 185,000 natives, and 10,000 Europeans. Benghazi is the principal town with a population of 30,056 in 1927. The chief occupation of the people is agriculture, although there are vast possibilities for cattle raising. Barley and wheat are the chief products. The former is the chief food of the people. In 1927 the imports were 178,238,195 lbs and the exports 14,908,800 lbs. The principal imports are cotton goods and sugar and the principal exports, sponges and barley. The internal commerce consists mainly of caravan trade between

Benghazi and Wadi For 1928-29 the revenues were estimated at Colonial revenue, 46,400,000 lire; State contribution, 159,096,250 lire, total, 205,496,250 lire Civil expenditure was estimated at 59,237,000 lire and military expenditure at 146,259,250 lire Governor during 1929, General Pietro Badoglio, appointed December, 1928, with headquarters in Tripolitania; Lieutenant-Governor, Colonel Domenico Siciliani, appointed December, 1928

#### CYTOPLASM. See Zoology

**CZECHOSLOVAKIA**, *chěko-slová-kia* An eastern European republic, formed Oct 28, 1918, out of the Slav regions of the old Austro-Hungarian Empire, formally dedicated a republic Nov 14, 1918; comprising the former Austro-Hungarian provinces of Bohemia, Moravia, Silesia, Slovakia, and Ruthenia, together with the portion of the Teschen district assigned to Czechoslovakia at the Ambassadors Conference July 28, 1920, Capital, Prague

**AREA AND POPULATION** The total area of Czechoslovakia is 54,207 square miles The population at the census of Feb 15, 1921, was 13,613,172 By race, it was distributed as follows Czechoslovaks, 8,760,937 (65.5 per cent); Germans, 3,123,568 (23.3 per cent), Magyars, 745,431 (5.5 per cent), Ruthenians, 461,849 (3.4 per cent), Jews, 180,855 (1.3 per cent), Poles, 75,853 (0.5 per cent), others, 25,871 (0.2 per cent) There were also 238,808 aliens The Czechoslovaks and Germans made up almost exclusively the population of Bohemia and Moravia, and the Czechoslovaks about half of Silesia and more than two-thirds of Slovakia The largest cities with their populations in 1921 are Prague, 676,657, Brno, 221,758; Ostrava, 113,709, and Bratislava, 93,189 The majority of the people are Roman Catholics, who numbered 10,383,833 in 1921 An official estimate of the population on Dec 31, 1926, placed it at 14,350,000

**EDUCATION** Primary education is compulsory between the ages of 6 and 14 In 1927 there were 14,333 public and private elementary schools, with 721,292 boys and 730,344 girls and 1781 public and private higher grade schools with 148,860 boys and 128,681 girls There were also 356 secondary Latin and technical schools with 102,366 students There are four universities as follows Prague (Czech) with 8225 students, Prague (German), 3651; Brno (Czech), 2107; Bratislava (Slovak), 1417

**PRODUCTION.** One of the richest of all European countries in natural resources, Czechoslovakia finds itself in the enviable position of being almost self-supporting so far as food is concerned Within its borders are to be found practically all of the former Austro-Hungarian Empire's . . . area, 60 per cent of the breweries, 50 per cent of the alcohol distilleries, nearly two-thirds of the iron production, and four-fifths of the textile industry Other industries were included in like or greater proportion in the new country, such as the famous Bohemian glass industry and the China industry

The soil of Czechoslovakia is naturally fertile, especially in the lower part of the country, where beets, wheat, barley, rye, and oats are extensively cultivated The area under the principal crops with their yield in metric tons during 1927 were as follows Wheat, 1,585,552 acres, 1,099,103 tons; rye, 2,029,643 and 1,252,195, barley, 1,759,426 and 1,284,853, oats, 2,113,312 and 1,457,637; potatoes, 1,608,249 and 9,109,263, sugar beet,

727,074 and 8,123,807; maize, 391,704 and 298,578 Preliminary estimates for crop areas in 1929 were wheat, 1,892,020 acres; rye, 2,484,820, oats, 2,087,150, corn, 323,090 The total value of the wheat, rye, barley, and oats crops in 1929 was estimated at 24 per cent less than in 1928 In 1926-27 there were 163 sugar factories in the country, which produced 1,045,819 metric tons of sugar Sugar production in 1928 was 1,057,000 tons, and in 1929, 1,030,000 tons The 875 distilleries produced 515,857 hectolitres of spirits The livestock on Jan 1, 1927, included Cattle, 4,691,320, horses, 740,202, pigs, 2,539,201, sheep, 861,128, and goats, 1,244,701

The mineral production comprises both soft and hard coal, iron, graphite, garnets, gold, silver, copper, and lead The 271 coal-mining companies in operation during the year, employing 94,420 workers, produced 15,171,403 metric tons of hard coal and 20,700,558 metric tons of lignite, both figures representing increases over the 1927 output Coke production increased 16 per cent during the year and the output of briquets showed a marked expansion In other lines of industry also conditions were unusually favorable during 1928, a situation which continued into 1929 In December, 1929, there was a distinct slackening of activity The 1928 output of iron ore was 1,779,000 metric tons, valued at 10,878,000 crowns (\$3,300,000), as compared with 1,500,527 tons, valued at 98,516,000 crowns (\$2,900,000) in 1927 Net imports brought the total consumption in 1928 to 3,194,800 tons, as compared with 2,372,208 tons in 1927

The output of pig iron in 1927 was 1,313,925 metric tons, raw steel, 1,689,000 tons, wrought steel, 1,499,000 tons In 1926 there were 11,522 factories in the country, of which 1990 were textile factories, 2093 glass works and stone factories, constituting one of the oldest industries of the country, 846 machine factories, and 875 metal factories Leather working also is extensively carried on

**COMMERCE** The country's foreign trade in 1928 reached the largest volume since 1921 Exports increased from 20,135,438,000 crowns in 1927 to 21,227,610,000 crowns in 1928 and imports from 17,961,632,000 in 1927 to 19,103,590,000 in 1928 (1 crown equals \$0.0296). The principal items of import and export are shown in the accompanying table from the *Statesman's Year Book* for 1929.

COMMODITIES ENTERING CZECHOSLOVAKIA'S TRADE		1927 1000 Crown	1928 1000 Crown
IMPORTS			
Cereals		2,172,000	1,921,000
Cottons		2,861,000	2,605,000
Woolen goods		2,040,000	2,081,000
Fats and oils		626,000	570,000
Iron goods		518,000	632,000
Machinery		473,000	702,000
EXPORTS			
Woolen Goods		2,086,000	2,185,000
Cottons		3,071,000	2,023,000
Wood, coal, and peat		2,038,000	1,788,000
Glass		1,144,000	1,269,000
Sugar		1,525,000	1,699,000
Iron and iron goods		1,619,000	1,770,000
Cereals and milled products		1,000,000	850,000

In 1927 Germany, Austria, Hungary, Great Britain, and the United States, in the order named, were the leading purchasers of Czech-

slovakian products, and Germany, Austria, the United States, Poland, Hungary, and Great Britain, also in the order named, furnished most of the imports. Imports from the United States showed a considerable gain in both volume and value in 1928. The favorable balance of trade in 1929 was only 497,000,000 crowns, as compared with 2,034,020,000 crowns in 1928.

**FINANCE** The budget for 1929 estimated total revenues at \$283,300,000 and expenditures at \$282,200,000, leaving a surplus of \$1,100,000. The total revenue from taxation and monopolies was placed at \$244,700,000, of which the income tax accounted for \$31,100,000 and import duties for \$34,600,000. Expenditures for the service of the public debt amounted to \$65,700,000, for defense, \$41,400,000, social service, \$24,700,000, education, \$27,300,000. The budget placed the public debt, exclusive of that arising from the peace treaties, at 887,500,000, or \$75 per capita. There has been a gradual but steady reduction in the debt in recent years, and the financial condition of the country is comparatively satisfactory due to the favorable economic situation. In 1927 the revenue yield exceeded the budget estimates and direct taxes were reduced by approximately 374,000,000 crowns in 1928. In that year's budget, the total of ordinary and extraordinary revenue was estimated at 9,562,270,000 crowns (9,569,907,000 crowns in 1929) and the ordinary and extraordinary expenditures at 9,536,074,000 crowns (9,534,383,000 in 1929).

State notes in circulation at the end of January, 1929, totaled 6,493,000,000 crowns.

**COMMUNICATIONS** There are 8530 miles of railway line in the Republic, of which 6859 are owned by the state. The remaining 1671 miles are privately owned, with the exception of 12 miles owned by foreign states. The introduction of improved conditions and schedules for international trains operating through Czechoslovakia was announced by the Ministry of Railways in December, 1929. The time between Berlin and Prague was to be cut from 7½ to 6 hours by a new express. By Article CCCXLIV of the Versailles Treaty, Czechoslovakia was vested with the right to use certain wharves in the ports of Hamburg and Stettin as a means of gaining direct access to the sea. The German cities refused their consent, however. The dispute was settled Nov. 4, 1929, when a committee consisting of one Czechoslovakian, one German, and one Briton decided that the Hamburg Senate must lease to Czechoslovakia certain lands at the Halle and Dresden shores of the River Elbe for 99 years. During 1929 plans were completed for the construction of a canal, to cost \$77,500,000, between Bratislava, Czechoslovakia, and Trieste, Italy. In 1927 there were 79,904 miles of telegraph and 292,531 miles of telephone wire. Thirteen air routes connected Prague with the principal European cities.

**GOVERNMENT** According to the constitution adopted by the National Assembly, Feb. 29, 1920, executive power is vested in a President, elected for seven years by the two chambers in joint session, who appoints and recalls his ministers; and legislative power in a Senate of 150 members elected for eight years and a Chamber of Deputies elected for six years, the former elected by all citizens over 26 years of age and the latter by all citizens over 21 years of age. The principle of proportional representation is applied. The composition of Parliament, according to preliminary

returns from the election of Oct. 27, 1929, was as follows: Czech Agrarians, 46; Czech Social Democrats, 39; National Socialists, 32; Communists, 31; Czechoslovak Clericals, 31; German Social Democrats, 20; Slovak People's party, 17; Czech Democrats, 15; German Clericals, 14; German Nationalists, 7. The remaining seats were distributed among nine smaller parties. President in 1929, Thomas G. Masaryk (elected May 28, 1920, reelected May 27, 1927).

A bourgeois-socialist government was formed Dec. 7, 1929, with František Udržal as Premier. Other members of the Cabinet, which is composed of 12 Czechs, two Slovaks, and two Germans, are Dr. Eduard Benš, Foreign Affairs; Dr. B. Vlasak, Finance; J. Čený, Interior; Dr. Franz Matoušek, Commerce; Jan Dostalek, Public Works; Josef Najman, Railways; Dr. Ludwig, Social Welfare; Dr. Robert Mayr-Harting, Justice; Bohumír Prádac, Agriculture; Dr. Anton Stefaňák, Education; Dr. František Nosek, Posts and Telegraphs.

**HISTORY** The year 1929 was marked by violent political turmoil, resulting in the resignation on February 1 of Premier Svehla, the defeat in September of the Udržal coalition government, and the dissolution of Parliament on September 24 by President Masaryk. A general election on October 27 resulted in gains of 4, 10, and 3 seats, respectively, by the National Socialists, Czech Social Democrats, and German Social Democrats, largely at the expense of the Communists, who lost ten seats (for composition of new Parliament, see under *Government* above). A new bourgeois-socialist coalition government was formed Dec. 9, 1929, with František Udržal again as Premier (for rest of cabinet, see under *Government* above). Parties participating in the government were the Czech and German Agrarians, the Clerical Czech People's party, National Democrats, Czech Business party, and Czech and German Social Democrats. The Communists, German Nationalists, German National Socialists, German Christian Socialists, Slovakian People's party, and both Hungarian parties formed the Opposition.

The growing Slovak agitation against Czech rule culminated in 1929 in the trial and conviction on October 5 of Professor Voitech Tuka on charges of high treason. He was sentenced to 15 years imprisonment after a trial which commenced in January, 1929, engaged the attention not only of the Czechs but of the other countries of Europe. He was vigorously defended during the trial by Father Andreas Hlinka, leader of the Slovak People's party, who declared that the government sought not only to punish Professor Tuka but to destroy his party. Tuka's conviction was followed by the resignation on October 8 of M. Labay and Dr. Tiso, the two Slovak Ministers in the Cabinet, and on October 9 by the announcement of Father Hlinka that his party would henceforth join with the Hungarian and German minorities in an effort to overthrow Czech dominance. The Slovak People's party placed Professor Tuka on its list of candidates for Parliament but the Slovaks did not rally to his support at the election of October 27 and he failed of election on the first scrutiny, although preliminary returns indicated that he might win a seat in the second.

The Czechs accused Professor Tuka of aiding the irredentist movement among the Magyars who were incorporated in Czechoslovakia along

with a small slice of Hungarian territory by the peace treaties: Denying any connection with the movement, Tuka charged the government with making him the scapegoat for its failure to solve the problem of Slovak autonomy in the political field.

The ministry was reconstituted Feb. 2, 1929, was as follows: Prime Minister and Minister of National Defense, František Udržal, Foreign Affairs, Dr. Eduard Benš, Finance, Dr. B. Vlasak, Interior, J. Černý, Commerce, L. Noviak, Public Works, Dr. Franz Spina, Railways, Josef Najman, Social Welfare, Dr. Jan Sramek, Justice, Dr. Robert Mayr-Harting, Agriculture, Dr. Otakar Srdínko, Education, Dr. Milan Hodža, Posts and Telegraphs, Dr. František Nosek, Health, Dr. Josef Tiso; Minister for the Unification of Laws, Dr. Labay (February 27). Dr. Hodža resigned as Minister of Education on February 20, ostensibly because of illness, and Dr. Anton Štefánek of the Slovak Centralist party was appointed.

Foreign Minister Benš, on February 20, announced that his government would refuse to pay claims awarded the Archduke Frederick of the Hapsburg line by an arbitral tribunal at The Hague as recompense for his property, which was confiscated by Czechoslovakia under authority of clauses in the treaties of Trianon and St. Germain. Furthermore, Dr. Benš said, his country would henceforth decline to submit any similar claims to the arbitration of a foreign or international court.

The so-called Little Entente treaties of alliance between Czechoslovakia, Rumania, and Rumania, concluded in 1920 and 1921, were renewed after a conference of their respective Foreign Ministers at Belgrade May 21. They were ratified by the Prague government on August 24, along with a new tripartite treaty of conciliation and arbitration signed at the Belgrade meeting.

Tense relations developed between Czechoslovakia and Hungary early in July when a Czechoslovakian railway employee was arrested at the Hungarian railway station in Hidasnémeti on a charge of espionage. Czechoslovakia suspended all traffic on the Budapest-Kassa railroad in reprisal but the line was reopened July 24, although Hungary steadfastly refused to release the prisoner.

On September 28, the Papal Nuncio at Prague decorated President Masaryk with the Grand Cross of the Order of the Sacred Tomb, a distinction hitherto reserved for Catholic sovereigns only. The presentation made in connection with the national observance of the thousandth anniversary of the Catholic Saint Wenceslaus, was taken as an indication of the final healing of the breach with the Vatican caused by the adoption of the birthday of John Huss as a national holiday in 1926. The naturalization pact negotiated between Czechoslovakia and the United States in 1928 went into force Nov. 14, 1929, with the exchange of ratifications.

The increasing difficulties of the agricultural situation due to a 50 per cent drop in the prices of farm products led to agrarian demands for government aid toward the end of the year. A proposal by the farmers for a 15 per cent reduction in the wages of agricultural laborers was followed by the announcement that a widespread agricultural strike would take place Jan. 1, 1930.

D'ABERCOM COLLECTION. See ART SALES.

**DAGNAN-BOUVERET**, dá-nyán-bóo-vrâ, PASCAL ADOLPHE JEAN A French historical and portrait painter, died July 3, 1920, in Paris. He was born there Jan. 7, 1852, and studied art under Gérôme. His first important success was "A Wedding at the Photographer's" (1879, Lyons Museum). He was an excellent draftsman and had a fine sense of color. "The Consecrated Bread" (1886), in the Luxembourg, shows his skillful management of light in interiors. Among his important paintings are "The Conscript" (1891, Ministère des Beaux-Arts), "Painting" and "Lady with a Child" (Palais des Beaux-Arts), "Madonna" (Pinakothek, Munich); "Madonna of the Rose" (Metropolitan Museum, New York), portraits of Gérôme, Courbet, and other prominent persons, "Spanish Dancer" (1909), "Marguerite au Sabot" (1912). He was made Chevalier of the Legion of Honor in 1885, and received the first medal at the Salon of 1889 for his "Breton Women at the Pardon."

**DAHOMÉY**, dá-hó-mí A French colony on the west coast of Africa between Togoland on the west, the British possessions of Lagos and Nigeria on the east, and the French military territories on the north. It is a subdivision of the colony of French West Africa (See FRENCH WEST AFRICA). The colony has only about 70 miles of coast, but opens out northward into a wide hinterland. Area, 62,772 square miles, population, according to the census of 1927, 1,057,260, of whom 1000 were Europeans. The chief center of trade and the seat of the government is Poto Novo with a population of about 27,000. The population, of pure Negro blood, is very industrious and engages mainly in agriculture. In the coastal region, they raise potatoes, corn, manioc, and yams. In the central provinces, cotton culture has been introduced. The forests contain oil palms of commercial importance. The chief exports are palm oil and palm kernels. Imports in 1928 amounted to 131,349,000 francs, exports, 97,773,000 francs. The local budget for 1926 was 10,102,000 francs. Governor in 1929, M. Reste.

**DAIRYING** The dairy industry has long been recognized as one of the most stable of the agricultural enterprises of the United States, probably because of the almost universal demand for dairy products, and the fact that the income of the milk producer is relatively uniform in its distribution over the year. Periods of excessive profits are generally unknown but heavy losses are likewise relatively rare.

The stability of dairying continued in the main through 1929. Conditions were generally favorable, but not so outstandingly so as in 1928. A relatively large spring and summer production lowered the price of dairy products to some extent, but the late summer and fall drought which was particularly pronounced in the dairy sections of the Atlantic and North Central States tended to restore them.

In November there was the most radical price decline in the butter market that has occurred at that season since 1921. Wholesale prices dropped to about 40 cents. This was associated with unsettled conditions in the stock market, but was probably more directly related to the relatively heavy butter stocks in storage. On November 1, there were 33,000,000 pounds more butter in storage than on November 1, 1928, and an increase of 25,000,000 pounds over the average for the last 5 years. Movement of butter to storage also increased in December, so that the

butter in storage at the close of the year was nearly twice that on hand at the close of 1928. The situation was aggravated by an apparent domestic butter consumption of some 20,000,000 pounds less than in 1928. At the same time, the production of butter substitutes was evidently increasing.

The production of canned milk was over 100,000,000 pounds more than in 1928. On account of the unsettled butter market toward the end of the year, surplus milk supplies of some of the fluid milk sections were reverted to condenseries, where it was used for the manufacture of condensed and evaporated milk instead of butter. Reduction in the stocks of canned milk in the fall was only about half the usual reduction, though it was equal to that of 1928.

Cheese markets were apparently in a stronger position on account of a reduction of about 50,000,000 pounds in manufacture, as compared with the previous year.

On the whole, the main difficulty in the marketing of dairy products was related to the need of more active buying demand on the part of consumers. Notwithstanding a reduced production of 15 per cent in cheese, the increase in butter production of about 1 per cent and of canned-milk production of about 8 per cent balanced the apparent production of dairy products so that the milk equivalent in the manufactured products showed little change from 1928. This was coupled with a reduced consumption in butter and cheese and an increased consumption of condensed and evaporated milk, resulting in a decrease of about 2 per cent in the milk equivalent of the manufactured dairy products.

For a number of years dairy production in the United States has been slightly less than domestic consumption. Exports of about 110,000,000 pounds of condensed and evaporated milk which were less than in 1928 were more than offset in milk equivalent by the importation of about 75,000,000 pounds of cheese, consisting mainly of the special foreign types principally from Italy and Switzerland.

Notwithstanding the large amount of publicity given to the importation of fresh milk and cream from Canada, the special provisions for requiring Canadian producers to comply with the public health regulations of domestic municipalities and the special efforts of the Canadian Government to aid producers in complying with requirements, slightly less fresh milk and cream was imported during 1929 than in 1928.

On account of the tariff and relatively unfavorable market conditions, very little butter was imported, totaling less than 3,000,000 pounds during 1929. Most of this came in during the winter and spring months, which is the season of low production in the United States but the season of heavy production in New Zealand, the country from which the bulk of butter imports to the United States is derived.

**INTERNATIONAL CONDITIONS.** The foreign dairy situation was quite comparable to that described above for the United States. European butter markets were generally regarded as disappointing, especially during the latter part of the year. Butter imports into Great Britain during 1929 were somewhat in excess of those in 1928. During the first 11 months of 1929 they amounted to 717,541,776 pounds, as compared with 684,652,864 in the preceding year. The increased importation resulted in a considerable accumulation.

German imports increased from 278,999,626 pounds in 1928 to 296,225,929 in 1929. This was associated with an increased domestic butter production as a consequence of lighter milk consumption.

Dairy production during the season beginning in August, 1929, in New Zealand was relatively heavy, but the tendency at the close of the year was to divert from the heavy butter production in the first part of the season to cheese production. Many of the New Zealand plants are equally well equipped for the manufacture of either butter or cheese. Dairy production in Australia was steadily increasing and was reported to be approximately 25 per cent heavier at the close of the year than for the corresponding period of 1928.

The tariff of 12 cents per pound on butter and 37 1/2 per cent ad valorem on Swiss cheese was an important factor in maintaining prices in the United States which were generally more favorable than those in the European markets.

**TRENDS IN RESEARCH.** The problem of replacing the older and discarded animals in dairy herds is one of much interest to dairymen. It is frequently considered that it is cheaper to purchase cows than to raise heifer calves in the market milk sections because of the large amounts of milk consumed by the calves and the relatively high prices of feeds, lands, and necessary equipment. Purchased cattle are, however, frequently inferior in milk producing capacity and there is more or less risk from the spread of diseases involved in the replacement of herds in this way.

Many of the State agricultural experiment stations, therefore, conducted tests of the comparative values of home-mixed calf meals, desiccated milk products, and other substances as substitutes for varying proportions of the milk ordinarily used for calf feeding. Liquid and powdered skim milk and semi-solid butter milk were found quite satisfactory, except for the expense, in studies of this nature at the Ohio and Wisconsin experiment stations. In studies at the South Dakota experiment station self feeders showed no superiority over hand feeding as a method of raising dairy calves.

The superiority of the high-producing cow over the medium or low-producing cow as an efficient milk producer was becoming more generally recognized and the United States Department of Agriculture aided in the identification and elimination of the low producers by the organization of dairy-herd testing associations, of which about 1100 were in operation. This work involved the testing of more than 465,000 cows monthly. By the elimination of the low-producing animals, the possibilities of the herds for breeding purposes were materially improved. Interest was stimulated also along the line of using only bulls for herd sires which have demonstrated, by the characteristics of their offspring, that they transmit desirable qualities to their sons and daughters.

Advance was continuously being made in the methods of manufacture of dairy products and the more efficient utilization of by-products. The U. S. Department of Agriculture contributed to the refinement in the method of manufacture of domestic Swiss cheese, by developing a bacterial culture which prevented, by its rapid growth and acid formation, the production of a defective eye formation and texture, resulting from

abnormal gassy fermentation. The Wisconsin Experiment Station perfected a process for pasteurizing cheese curd in the vat which markedly improved the flavor and texture of cheese made from second-grade milk.

In the field of butter production, the Arkansas, New York, and Wisconsin agricultural experiment stations made important contributions with reference to working, neutralization, and starters, and the U. S. Department of Agriculture studied the preservation of skim milk by concentration and developed further uses for the concentrated product.

The Kansas and New Jersey experiment stations studied the advisability of including egg yolk as a part of the ice-cream mix. It was found that from 0.5 to 1 per cent of egg yolk in the mix improved its whipping qualities and texture. The use of more than 1 per cent of egg yolk imparted an undesirable flavor.

The continued interest in dairy research was reflected in the development of the physical equipment at many of the State institutions. New dairy buildings were completed at the Iowa, Illinois, Kentucky, and Louisiana experiment stations during the year and new dairy buildings were erected at many of the State agricultural colleges and experiment stations within the last few years. Plans for new equipment and buildings were completed at several of the other institutions.

**CHANGES IN PERSONNEL.** The more important changes in personnel included the resignation of Dr. C. W. Laison from the National Dairy Council to become associated with a new commercial dairy enterprise. Prof. A. C. Baer, head of the dairy department at the Oklahoma Agricultural and Mechanical College, who died on May 1, 1929, was succeeded by Prof. E. A. Weaver from the Iowa State College. Dr. R. B. Becker and Dr. H. A. ... from the Oklahoma A and M College accepted positions with the University of Florida and the Alabama Polytechnic Institute, respectively. Prof. H. O. Henderson was appointed head of the dairy department of the West Virginia University. Clarence B. Lane, Assistant Chief of the Dairy Division of the United States Department of Agriculture from 1903 to 1909, died on August 20.

**BIBLIOGRAPHY.** The more important published reference books on dairying include: J. Cameron, *The Bureau of Dairy Industry: Its history, activities, and organization* (Inst. Govt. Research); C. H. Eckles, W. B. Combs, and H. Macv, *Milk and Milk Products* (New York and London, 1929); V. M. Peleza, *La Leche y Sus Productos* (Madrid, 1928); C. W. Walker-Tisdale and W. E. Woodnutt, *Practical Cheese-making* (London, 1928); *Abstracts of Literature on the manufacture and distribution of ice cream* (vol. 11 Harrisburg, Pa., 1928); B. W. Hammer, *Dairy Bacteriology* (New York, London, 1928); H. L. Russell and E. G. Hastings, *Outlines of dairy bacteriology* (Madison, Wis., 1928).

**DALMATIA.** A province of Yugoslavia, a crownland of Austria until the downfall of the Dual Monarchy in 1918. It extends from Bosnia and Herzegovina west to the Adriatic Sea. Area, 4916 square miles, population, according to the census of Jan. 31, 1921, 621,429. Capital, Zara, with a population in 1921, of 8060.

**DAMS.** The outstanding events in the field of dam construction during the year 1929 may be

stated as the refusal of the California authorities to permit the construction of the great San Gabriel Dam which was under way near Los Angeles, the completion of the Diabolo Dam, the highest in the world, and the success of the Boulder Canyon project in meeting the preliminary conditions set down by Congress in authorizing the construction of this great project. While both the gravity and arch types of dam hold their own, it is clear that a combination of these types, an arched centre portion with gravity ends or abutments, is an economical form in many locations. Similarly, the combination of the gravity and the multiple-arch types was to be noted in the important Suviana Dam in Italy.

**GRAVITY DAMS.** Until the completion of the Boulder Canyon Dam, the arch type held the record for height. It will be remembered that the special commission on the Boulder Dam recommended a more conservative design than that first proposed and a reduction of the maximum pressure on the foundation to 30 tons per square foot. Revised plans were not available at the end of 1929, but they were expected to be published early in 1930.

**SAN GABRIEL DAM.** In 1924 the city of Los Angeles voted a flood-control bond issue which included \$25,000,000 for this great dam. After a long period of controversy, due in large part to the fact that the dam was to form a reservoir for both flood control and irrigation, thus involving conflicting interests, final plans were adopted in 1928. The contract was awarded in December of that year and excavation was under way until September, 1929.

After this work was started, the failure of the St. Francis Dam (see 1928 YEAR BOOK) occurred. This failure resulted in the passage of a State law in California requiring the approval by the State Engineer of the design and location of all dams built within the State. When an extensive rock slide occurred during the excavation for the San Gabriel Dam in September, 1929, work was stopped immediately by the engineers of the district and a board of engineers and geologists were called in to examine the site. They reported adversely. Directly following this report, the State Engineer engaged a similar group of experts who also reported adversely, stating that the proposed dam "cannot be constructed without creating a menace to life and property." Thereupon, the State Engineer, on November 26, refused permission for this construction.

The report disclosed the fact that the rocks at the site were "ancient crystalline types, including granite and dioritic gneisses and occasional schists, cut by a variety of igneous intrusions, including granite, diorite, diabase, and other types. . . . Cut through in every direction by faults, slips, and crush zones, the rock at the site has been separated into blocks of various sizes and shapes, mostly of comparatively small size." It is difficult to understand how the preliminary borings and foundation examinations failed to indicate these conditions before excavation began, although it would be still more difficult to understand the letting of a contract for construction if such conditions had been known to exist.

While it was very obvious that the Forks site for the San Gabriel Dam, some 30 miles northeast of Los Angeles, was not at all suited for

a great gravity dam of 492 feet in height, the highest dam in the world, the experts suggested that an earth-and-rock-fill dam of conservative section could safely be built at this site.

**LLOYD DAM, INDIA** This dam, forming the major part of a great irrigation scheme built by the Bombay Presidency at Bhatgar, India, was officially opened in October, 1928. One of a great series of protective works begun in 1803, following the famine era of 1889-1902, this dam is notable not only for the important part it plays in a great project conceived on a great scale but also because of its great size—it is the largest dam in the world. The site required a structure over a mile long (5333 feet) with a maximum height above foundations of 190 feet. It cost \$6,300,000, took 15 years to build, and forms a lake 17 miles long. The dam is of gravity type with 45 automatic and 36 other gates to regulate flow. Some 21,500,000,000 cubic feet of masonry were involved in the construction which supplies the two main canals of the Nira system, 101 and 100 miles long, which command an area of 834,000 acres.

**PARDEE DAM, CALIFORNIA** This dam, which is part of the Mokelumne River water supply being built for nine cities of the East Bay Utility District of California, was to be the highest gravity dam yet built. It is of the curved gravity type and will be 359 feet in extreme height. Particular attention has been given to contraction joints in this structure, and provision has been made for joints 150 feet apart through the base and 37½ feet apart in the upper section. The contraction joints are being provided to prevent cracking of the masonry and possible leakage, they were also to be grouted with cement under pressure during the winter of 1929-1930, when full contraction of the masonry will have occurred. It was expected that this method of securing a solid masonry mass would add considerably to the stability of the structure due to arch action because of its curved form. High-speed construction methods were followed in building the dam and a battery of four two-yard concrete mixers served by a 4-mile cable tramway enabled the builders to place over 65,000 cubic yards of concrete in one month.

**BULL RUN, OREGON** This gravity-section dam 200 feet high was being built on an arched plan to give additional safety against sliding. A new trend in concrete construction was indicated in the fact that a denser mix than that used in the center of the mass was being placed on both upstream and downstream faces. The reservoir formed by the dam will store some 31,000 acre-feet of water and would more than double the supply available for the city of Portland, Ore. The dam was completed in January and, by May 14, the reservoir had been filled and water was passing over the spillway. In view of the fact that studies of a number of dams on the West coast of the United States indicates that water, percolating and seeping through these structures, has shown a marked leaching action, this attempt at Bull Run to obtain an impermeable concrete is of particular interest.

**WATERVILLE, NORTH CAROLINA** A power project of the Carolina Light and Power Company on the Big Pigeon River required the construction of a concrete dam of large size. It is of unusual interest due to the fact that the dam is of the overflow type and a free drop of 180 feet for the overflow water is provided by means of a concrete

protection wall and apron. The dam is of the high thin-section arch type.

**MARATHON DAM.** On October 25, the Marathon Dam, part of a water-supply system for Athens, Greece, was dedicated. The structure is notable not because of any novel features of design nor because of its size but simply because it is faced with the famous Greek Pentelikon marble, used in the greatest structures of Classical Greece, and because the supply will be carried to Athens by the famous aqueduct built some 18 centuries ago under the Roman Emperor-Engineer, Hadrian.

**ST. FRANCIS DAM** Plans were being prepared for a new dam near Los Angeles to replace this ill-fated structure, the failure of which caused great damage and loss of life. The new dam was to be some miles below the St. Francis site.

**ASWAN DAM** In 1907 the great Aswan or Assuan Dam on the Nile in Egypt was increased 164 feet in height. Now, a buttressing scheme and added material on the top of the existing structure is proposed to secure an additional height of 30 feet. It was expected that this plan would go forward without delay.

**ARCH DAMS** Arch dams continued to be built in increasing sizes wherever the cross-section at the site is suitable—that is, where solid and steep abutment walls provide proper surfaces to receive the end thrusts of this form of construction.

**DIABLO DAM** Seattle's 425-foot dam on the Skagit River progressed rapidly during the year. Part of a municipal waterpower project, this structure is a constant-angle arch dam between gravity abutments. The dam is located about 100 miles northeast of Seattle and will impound 90,000 acre-feet of water. The site is a narrow gorge with granite walls rising almost vertically for 200 feet and only 125 feet apart in the lower portion. Above, the valley widens and the gravity sections on each end, somewhat longer than the arched section itself but of much less height, will contain the spillways of the dam. An especially dry concrete, giving a crushing strength of almost 4000 pounds per square inch, was used, and this fact, combined with a novel arrangement of belt conveyors supported by booms for placing the concrete, makes the work of special interest from the standpoint of construction. The dam section widens out from 57.5 feet at about the mean height to 130 feet in thickness at the base, and in maximum section the top of the structure is 426 feet above the lowest foundation. At water level, the maximum height is 410 feet.

**CALDERWOOD DAM** This notable structure, 230 feet high above foundations, nearing completion at Calderwood, 45 miles south of Knoxville, Tennessee, is the third unit of the hydroelectric development of the Little Tennessee River by the Aluminum Company of America. It is a true thin-section arch with a downstream radius at the crest of 312.5 feet. This radius is maintained for the top 45 feet and the rings of the arch are also of constant thickness, 25 feet. Below this, the radius rapidly decreases to a minimum at the base, while each arch ring is increased in thickness at the abutments. Special concrete was used in the construction of this dam and elaborate preparations were being made, in the hope of securing valuable data on arch-dam design, to measure the deflections of the structure as the basin back of it gradually fills with water. The dam is provided with 24 crest gates of the Stoney type, each 25 feet long and 20 feet high.

The overflow will be cushioned by a pool to be formed by a secondary overflow dam of gravity form 40 feet high and located 230 feet downstream from the main structure.

**MULTIPLE-ARCH DAMS** The notable development in recent years in the use of multiple-arch dams continued. This type of dam, an evolution from the slab and buttress form of hollow dam, has proved to be an economical structure in many locations due to reduced foundation excavation and to the saving in material over that required for the usual gravity type. Properly constructed, it should prove more reliable and have a longer life than the slab type, and it is doubtless destined to be widely used in those locations where the old and conservative gravity dam would be excessively costly to build.

**BIG DALTON DAM** In August, 1929, the Big Dalton Dam of the Los Angeles Flood Control District was completed. This dam, 180 feet high above foundations, 145 feet above stream bed, adds the eleventh unit to the flood-control and water-conservation plan of the district. It is located on Big Dalton wash, about 30 miles east of Los Angeles, and the 1280 acre-feet of storage provided will not only prevent the brief but devastating floods, to which the extensive orange groves below the site have been subjected, but also will store water which will be used to replenish the ground-water storage which has been seriously depleted owing to extensive pumping for irrigation. Six arches, varying in thickness from 2 to 5 feet, are supported on double-walled buttresses of 60-foot centres. The structure was heavily reinforced and one of the unusual features was the substitution of heavy gravity-type end sections, instead of the usual arch construction, so as to avoid difficult end excavation. A rock-fill dam was at first planned for this location and work was started in December, 1925. The lack of suitable material for such construction, however, resulted in the change in the plans.

**SVIYANA DAM, ITALY** Between 1922 and 1926, the Paviana Dam, of the Limentre hydroelectric development, was constructed. This notable work of the multiple-arch type consists of three arches with a height of 170 feet above average foundation level. Compared with American dams of this type, the upstream face is very steeply inclined, and the design was very solid, substantial, and conservative and resulted in a very monumental and imposing structure. This dam formed an important link in a chain of dams and tunnels to supply power for railroad electrification between Florence and Bologna. A second link in this development was under construction in 1928—the Suviana Reservoir. Inquiries await with interest the publication of the details of this work, as they recognize that modern hydroelectric construction in Italy has made many and important contributions to current practice in this field.

**LAKE PLEASANT DAM.** Apparently a desire to reduce cost to a minimum and a consequent cutting down of buttress sections and width resulted in at least a partial failure of this multiple-arch structure near Phoenix, Arizona, which rises 256 feet high above the lowest point of the foundations. In December, 1928, vertical cracks in the buttresses caused apprehension and a special investigating committee advised caution in putting the work in operation. Later it was advised that the spillway be cut down to an elevation of 130 feet above stream bed and the buttresses strengthened, or that the cut should be

made to elevation 120. Work on this cutting down was rushed in order that the dam might not be suddenly filled by flood. Thus, false economy again claimed a victim and the dam was crippled and doubtless would have to be rebuilt in large part.

**EARTH DAMS.** The history of earth-dam construction has been one in which the engineer has secured important knowledge largely through the failure or partial failure of a number of these earth structures. The year 1929 was no exception to this rule. In Australia the Eildon Dam, a rock-fill structure with a clay core, failed, fortunately with no loss of life. Apparently, the rock fills were not sufficient to sustain the pressure of the wet clay core. The Virgin River rock-fill dam, on a tributary of the Colorado River, was washed out during the year. The Lafayette Dam in California settled some 24 feet during construction and gave rise to doubts as to whether it could be successfully completed.

The two great problems in modern hydraulic-fill construction are, first, to secure an impervious core mass by deposition under water and, second, to secure a mass that will be stable and not slide under possible conditions of saturation—conditions frequently worse during construction than later in the life of the structure. Numerous slips in earth dams during construction illustrate clearly this danger. Naturally, an impervious material will not drain well, so that one problem is solved only at the expense of the other. Obviously, the success of the great earth constructions under way will depend in large measure on a most careful attention to these difficulties and the use of the best available data in design and for controlling construction operations.

**SALUDA DAM.** Construction was started on this huge earth dam late in 1927. It is a semi-hydraulic fill structure and some idea of its magnitude can be obtained from the fact that it will contain 11,000,000 cubic yards of earthwork, it will be 1½ miles long on the crest and 208 feet high. The dam forms a lake about 40 miles long, which will cover 78 square miles of land, will have a shore line of 620 miles, and will hold 2,300,000 acre-feet of water. The project is to be completed in 1930 and will be operated by the Lexington Water Power Company of Columbia, S. C., for hydro-power purposes. The dam is located about 10 miles west of Columbia. Approximately 40,000 acres of timber land must be cleared, and 35 sawmills and 1200 men were used in this work alone. Some 10,000,000 board feet of useful lumber will be salvaged. An impervious clay-earth core was formed in a segregation pool in the centre of the dam. The structure is 25 feet wide at the top and has a maximum bottom width of 1150 feet.

Construction arrangements for passing floods received a severe test during the year, when a flood of 68,000 cubic feet per second was successfully passed. This was said to be more than the dam will be called upon to pass when completed.

**LAFAYETTE DAM FAILURE.** The fill for this rolled-earth structure, being built by the East Bay Municipal Utility District in California, settled some 24 feet during construction and gave rise to grave doubts as to whether it could be completed. Investigation showed that the foundation material, a thick bed of clayey alluvium, was plastic and under the heavy load of the fill had been squeezed out, chiefly toward the down-

stream toe of the structure, permitting the central portion to collapse. Flatter slopes for the earth fill and a smaller height (100 feet) for the dam (originally 140 feet) were advised.

**VIRGIN RIVER ROCK-FILL DAM.** This work, under construction on a tributary of the Colorado River, was washed out in July before the dam had been completed to its full height of 120 feet. Apparently, the rock-fill was steep in slope and uncompacted and the water broke through when the depth was about 65 feet behind the dam. See *GEOLOGY*.

**DANA, JOHN COTTON** American librarian, died in New York City, July 21, 1929. He was born Aug. 19, 1856, in Woodstock, Vt. In 1878 he was graduated from Dartmouth, but it was not until 1889 that he entered upon his career as librarian. Meanwhile, he studied law in Woodstock (1878-80), but was forced because of ill health to go to Colorado where he worked as a land surveyor 1880-81. Returning to the East, he was admitted to the bar in New York in 1883, but was again in Colorado as a civil engineer in 1886-87. From 1889 to 1897, he was librarian at the Denver Public Library, and at the city library in Springfield, Mass., from 1898 to 1902. After 1902 he was with the Free Public Library at Newark, N. J., and from its foundation in 1909, he was director of the Newark Museum. Mr. Dana held liberal and revolutionary views in regard to library and museum methods. He believed that the public should be encouraged to know and to use all books and newspapers in a library, and that a museum should be a place of actual service. While he was librarian in Denver, he founded a special library department for children. The first library branch to be devoted to business in the United States was established by him in 1901 in Newark, N. J. He was one of the early champions of open shelves in public libraries, he advanced public library information service, he raised the standard of library printing, and set a standard for public library cooperation with other civic activities. Into the museum which he directed, he introduced a similar ideal of service. He was a pioneer in art in industry among American museum directors. He explained his views in a number of papers and books, among them *A Library Primer* (1896, revised, 1909, practically rewritten, 1920), *Library Problems* (1902), *American Art, How It Can Be Made to Flourish* (1914), *Libraries: Addresses and Essays* (1916), *On Buying and Using Print*, *Practical Suggestions from a Librarian to the Business Man* (1921), *Should Museums Be Useful?* (1927), *Modern American Library Economy as Illustrated by the Newark, N. J., Free Library* (vol. 1, 1908-12, vol. 2, 1913-18, 3d ed., revised, 1928).

**DANISH LITERATURE.** See *SCANDINAVIAN LITERATURE*.

**DANNAT, WILLIAM T. (URNER).** An American painter, died in Monte Carlo, Mar. 12, 1929. Born in New York in 1853, he studied at the Munich Academy, and in Paris worked under Carolus Duran, and Munkacsy. After traveling and painting in Italy and Spain, he established his residence in Paris, later becoming a teacher at the Ecole des Beaux-Arts. His exhibits at the Paris Salon in 1883 attracted much attention and won for him a medal, the state purchased the "Aragon Smuggler," and the "Lady in Red" for the Luxembourg. One of his best paintings, "The Quarrel," completed in 1884 and now in the Metropolitan Museum, New York, exemplifies his

daring, unconventional style and technical ability. Later, Dannat concentrated on color problems and was influenced by Japanese art. He chose many Spanish subjects, among them, "Sacrifice in Arragon," 1888, now in the Chicago Art Museum, and "A Café Chantant," a brilliant study of artificial light which was the sensation of the Munich exhibition in 1892 and remained in that city. Reverting somewhat to his earlier manner, Dannat produced the "Lady in White." In 1895 "Madame E," a portrait almost colorless except for the red of the woman's lips, and a likeness of the dancer, Otéro, aroused both criticism and praise. After winning the gold medal at the Buffalo Exhibition in 1901, Dannat exhibited little, and devoted his time chiefly to portraits. He received the Cross of the Legion of Honor in 1889 and was at one time president of the Paris Society of American Painters.

**DANZIG.** A free city, which, with its surrounding territory, was established by the Treaty of Versailles in 1919. It was formerly a part of the German Empire. Area, about 754 square miles, population in 1928, 390,000. The administrative district of the City of Danzig had a population of 230,000 in July, 1927. The city is the chief outlet for the commerce of Poland and continues to maintain its century-old position of being the leading grain port of the Baltic. Shipping is the chief industry, manufacturing being engaged in largely for local consumption.

In 1927, 6950 vessels of 3,899,354 tons entered and 6942 vessels of 3,932,577 tons cleared from the port. The budget for 1928 balanced at 117,028,590 gulden (1 gulden equals about \$0.154). The government of the free city is in the hands of a High Commissioner appointed by the League of Nations. Its constitution approved by the League May 11, 1922, provides for a legislative Assembly of 120 members elected for four years, a Senate consisting of 20 members, and a President and Vice President. The Senate is the highest authority in the city and holds secret sessions. High Commissioner in 1929, Count Mantied Gräfinas, appointed Sept. 22, 1928.

**DARTMOUTH COLLEGE.** A nonsectarian institution for the higher education of men in Hanover, N. H., founded in 1769. The 1929 autumn session had an enrollment of 2251 students, most of whom were working for the regular college degree, the exceptions being 15 graduate students, 39 students in the medical school, 25 in the Thayer School of Civil Engineering, and 104 in the Tuck School of Administration and Finance. There were 275 members on the faculty. The productive funds amounted to \$14,000,000. The library, housed in the Fisher Ames Baker Memorial Library, contained 300,000 volumes. During 1929 the Carpenter Art Building, the Seaborn English House, and two dormitories were completed, and a group of four connected buildings for the Tuck School, including administration and class rooms, dormitories, and a refectory, was under construction. A revised curriculum has been in force since 1927, providing among other things for special treatment for students of high grade and for the granting of but one degree, bachelor of arts. President, Ernest Martin Hopkins, A. M., Litt. D., LL. D.

**DARWIN'S COTTAGE.** See *ZOOLOGY*.

**DATE SCALE.** See *ENTOMOLOGY, ECONOMIC*.

**DAVIDSON, HON. SIR CHARLES PLESS** Canadian jurist, died in New York, Jan. 29, 1929. Born in Huntingdon, P. Q., Canada, in January, 1841, he

attended Victoria College, Cobourg, and McGill University, Montreal, and was called to the bar of the Province of Quebec in 1865. Made Queen's Counsel in 1878, he was raised to the bench in 1887, and served as puisne judge until 1912, when he was made chief justice of the Supreme Court of the Province of Quebec, a position which he retained until 1915. Sir Charles was also professor of criminal law at McGill. He was decorated for his services with the military forces during the Fenian raids, 1866-67, in 1887 he became lieutenant-colonel in the Victoria Rifles.

**DAWE PLAN.** See REPARATIONS; GERMANY, under *History*.

**DAWKINS, SIR WILLIAM BOYD** English geologist, died in Cheshire, England, Jan. 15, 1929. He was born Dec. 26, 1837, in Butington, Welshpool, and was graduated from Oxford University. In 1861 he became a geologist in the Geological Survey of Great Britain, holding the position until 1869, during which time he conducted important research in the history of early man. Later, from 1874 to 1890, he traveled in North America and Australia, adding much to his investigations. In 1870 he was appointed curator of the Manchester Museum and the same year became lecturer at Owens College, and in 1872, professor of geology. In 1880 he gave the Lowell lectures in Boston. Professor Dawkins combined theory with practice, being, after 1870, consulting geologist in mining and civil-engineering projects. Among the enterprises for which he acted as geological adviser were the engineering of the Manchester Ship Canal, a survey of the French and English coasts for the proposed Channel tunnel, and for the water supplies of cities of England and New Zealand. He was a fellow of the Royal Society and honorary professor of geology and paleontology at Victoria University in Manchester. He was knighted in 1919. His published works are *Cave Hunting* (1874), *Early Man in Britain* (1880), *British Pleistocene Mammals* (1886-87).

**DEATH RATE.** See VITAL STATISTICS.

**DECEPTION ISLAND.** Deception Island (Lat. 63° S., Long. 60° 15' W.) near the northern extremity of Graham Land is a volcanic island into whose breached crater the sea has entered and provided an excellent land-locked harbor for the whaling vessels congregating in the adjoining waters each year. Fumaroles and hot springs give evidence of recent volcanic activity. This island was used as a base for the Wilkins-Hearst Antarctic Expedition in 1928 and 1929. See POLAR RESEARCH.

**DEFECTIVES.** See CRIME.

**DELAWARE.** POPULATION. According to the Fourteenth Census the population of the State on Jan. 1, 1920, was 223,003. The estimated population on July 1, 1928, was 244,000. The capital is Dover.

**AGRICULTURE.** The accompanying table gives the

Crop	Year	Acreage	Prod. Bu.	Value
Corn	1929	132,000	4,224,000	\$3,717,000
	1928	136,000	4,468,000	3,949,000
Wheat	1929	101,000	1,919,000	2,226,000
	1928	102,000	1,886,000	2,295,000
Hay	1929	83,000	120,000	2,069,000
	1928	83,000	141,000	2,281,000
Potatoes	1929	7,000	546,000	874,000
	1928	7,000	658,000	494,000
Sweet potatoes	1929	8,000	1,160,000	1,044,000
	1928	7,000	980,000	784,000

\* Tons

acreage, production, and value of the principal crops in 1928 and 1929.

**MINERAL PRODUCTION.** Clay products, which form the chief element of the State's mineral industry, yielded a greater total in 1927 than in 1928, the value of all clay products for the year 1927 being \$293,089, as against \$156,897 for 1926. The output continued to be entirely in the class of brick and tile. Outside of clay and its products, the only mineral activity of importance in the State was the production of stone, sand, and gravel. The total mineral product of Delaware was, for 1927, \$493,377, for 1926, \$375,945.

**FINANCE.** State expenditures in the year ended June 30, 1928, as reported by the U. S. Department of Commerce, were: for maintenance and operation of governmental departments, \$4,826,035 (of which \$1,406,380 was for local education); for interest on debt, \$474,073, for permanent improvements, \$2,558,123, total, \$7,858,231 (of which \$2,383,939 was for highways, \$258,167 being for maintenance and \$2,125,772 for construction). Revenues were \$8,968,467. Of these, property and special taxes formed 58.8 per cent, departmental earnings and remuneration for officers' services, 6.3, license sales, 23.1 (including gasoline taxation of \$747,583). The State debt, \$11,406,285 on Jan. 1, 1928, and \$8,448,752 net of sinking funds, included \$10,530,000 for highways. On a property valuation of \$265,582,580 were levied State taxes of \$398,374.

**TRANSPORTATION.** The total number of miles of railroad line under operation on Jan. 1, 1929, was 325.11. There was built, in 1929, 0.01 mile of additional first track.

**MANUFACTURES.** According to the biennial Federal Census of Manufactures published by the U. S. Department of Commerce in 1929 and relating to the operations of 1927, there were in the State, 446 manufacturing establishments. These employed 21,324 wage earners, whose wages for the year totaled \$25,222,182. Materials and supplies used in production cost \$69,032,720. Manufactured products attained the combined value of \$129,899,735.

**EDUCATION.** The educational effort of the State was amplified by the action of the Legislature in appropriating for the succeeding biennium a total 30 per cent greater than in the preceding similar period, for current school expenditure, and a total 25 per cent greater for State aid to school construction. For the academic year 1928-29, the gross enrollment in the public schools was 42,432; the net enrollment, 41,586. Of the latter total, 34,809 pupils were enrolled in elementary, and 6777 in high-school, grades. The expenditures for public-school education in the State during the year totaled \$4,309,183. The yearly salaries of public-school teachers averaged, for whites, \$1208.65, for the colored, \$1065.99.

**CHARITIES AND CORRECTIONS.** Statutory provision for the sterilization of defectives, in force in the State since 1923, was amplified in 1929 by a law creating a Mental Hygiene Clinic at the State Hospital at Farnhurst endowed with power to recommend any feeble-minded, epileptic, or insane person in the State for sexual sterilization. Another act empowered this Clinic to recommend for sterilization likewise any person convicted of three felonies, on the Clinic's finding that criminality had resulted from mental abnormality or disease. Final decision on such recommendations rested with the State Board of Charities. The Board of Charities, the State's

central administrative organization for institutions of care and custody, visits State institutions and supervises dependent children that have been imported from outside the State. State institutions, each under its own board, are Delaware State Hospital for the Insane, Farnhurst, Delaware Industrial School for Girls, Claymont, Industrial School for Colored Girls of Delaware, Marshallton, New Castle County Farm for Women, Retention Home for Juveniles, Delaware Colony for Mental Defectives. The State maintained the Mothers' Pension Commission, the State Health and Welfare Commission, and commissions for the blind and the feeble-minded.

**LEGISLATION** The 102d session of the State Legislature convened on January 1 and adjourned on April 19. By act, a place on the State highway commission was taken from the Secretary of State and given the Governor. The record of satisfaction of mortgages was required to be entered within 60 days. An enactment rendered compulsory the teaching, in public schools, both elementary and high, of the effects of alcoholic drinks, stimulants and narcotics on the human system, along with other matters of physiology and hygiene. The State adopted the principle of sterilization of undesirable, by the passage of statutes providing for the sterilization both of the mentally deficient and of persons who had been three convicted of felonies. Provision was made for the licensing of aircraft and pilots and for the regulation of aerial navigation. The law providing the death penalty for first-degree arson was modified. The State Board of Agriculture received authority to carry on the tuberculin test of cattle under the system known as the "Modified Accredited Area" plan. Under the same board was placed the direction of the Japanese beetle quarantine, previously answerable directly to the Governor. Among measures enacted that bore on public education were an appropriation of \$2,500,000 for a school-building programme, appropriation of \$6,500,000 for the school budget, an act enabling the State Board of Education to determine in consultation with local trustees the number of grades to be taught in local schools. There was much legislation dealing with sport. Hunting bouts were legalized, the shooting of waterfowl on public lands bordering on the shores of the State was prohibited, protection for these wild birds being thus afforded, the daily catch of each sort of the chief fresh-water fish was limited, and the minimum length of calico bass lawful to possess was set at 6 inches. A commission for the work of opening the closed Indian River inlet was created, with an appropriation for the purpose. Exemption from inheritance tax on legacy to the widow was raised to \$20,000, from \$3000. The fiscal system was somewhat changed by the passage of amendments to the income tax, providing for other things exemptions of \$200 for each. . . . 20, by the elimination of the State's invested capital tax, and by a franchise tax designed to take its place.

**POLITICAL AND OTHER EVENTS** With a view to enabling the State Highway Department to carry on its work directly out of revenue, the State administration, through the Sinking Fund Commission, retired on July 1, \$2,100,000 of highway bonds and made preparation for calling other highway bonds to the amount of \$1,455,000 at the outset of 1930. New Jersey filed against Delaware in the United States Supreme Court on June 3 a suit to establish the boundary between

the two States beneath the waters of Delaware Bay. Delaware's contention that her territory extended to the low-water mark on the New Jersey shore was opposed by New Jersey's contention that the boundary followed the mid channel of the Bay. The suit was peculiar in that it involved the evidence to be drawn from some of the oldest documents available relating to the American colonies. It was announced on July 13 that Alfred I. du Pont had the intention of providing pensions to "worthy residents of the State over 65 years old," thus making good the failure of the Legislature of 1929 to pass an old-age pension measure with which he sympathized.

**OFFICERS** Governor, C. Douglas Buck, Lieutenant-Governor, J. Henry Hazel, Treasurer, Howard M. Ward, Auditor, Edward Baker, Secretary of State, Charles H. Grantland, Attorney-General, Reuben Satterthwaite, Jr.

**JUDICIARY** Chancellor, Josiah O. Wolcott, Chief Justice of Supreme Court, James Pennewill, Associate Justices, Richard S. Rodney, Herbert L. Rice, William Watson Harrington, Charles S. Richards.

**DELAWARE, UNIVERSITY OF** An institution of higher learning in Newark, Del., founded in 1833. The enrollment in 1928-29 was 694, of whom 395 were men and 299 were women. These were distributed as follows: Seniors, 141, juniors, 133, sophomores, 181, freshmen, 228, graduate students, 5, specials, 6. The enrollment in the 1929 summer session was 298. The faculty numbered 114 members, 86 of whom were on the regular teaching staff, the others being members of the experiment station and extension staffs. Appropriations from the State and Federal governments amounted to approximately \$375,000, expenditures for 1929 totaled \$624,362. Invested endowment funds amounted to \$540,000. The library contained approximately 55,000 volumes. Among the new buildings erected during the year were an engineering building and laboratories costing \$330,000 from State appropriation and an auditorium costing \$300,000 with an endowment of \$50,000, the gift of H. Rodney Sharp, an alumnus. President, Walter Hüllihen, Ph.D., D.C.L., LL.D.

**DELBÜCK**, delbrük, HANS. A German historian, died July 14, 1929, in Berlin. He was born Nov. 11, 1848, in Bergen, on the Island of Rugen off the coast of Germany, and was educated at Halle, Göttingen, and Bonn. Shortly after the Franco-German War, in which he served, he was preceptor of Prince Waldemar of Prussia, a brother of Emperor William II (1874-79). In 1882-83 and from 1884 to 1890, he was a deputy in the Reichstag. In 1883 he became an editor of the *Preussische Jahrbücher*, a German political magazine, and editor-in-chief in 1899. He was appointed professor of modern history at the University of Berlin in 1885, and in 1920 he became a member of the Historical Committee for the Imperial Archives. Professor Delbrück was a monarchist, a supporter and defender of the Kaiser's policies during the World War, and the leader of a group of historians working to prove that Germany was not responsible for the outbreak of the World War. He was the author of a number of important books, most of them on the history of the art of war. They include *Die Perserkriege und die Burgunderkriege* (1887), *Die Strategie des Perserkrieges erläutert durch die Strategie Friedrichs des Grossen* (1890); *Friedrich, Napoleon, Molt-*

ke, *Actors and neuerer Strategie* (1892), *Geschichte der Kriegskunst im Rahmen der politischen Geschichte*, 3 vols (1901-07), *Romer und Germanen* (1902), *Das Mittelalter* (1907), *Erinnerungen, Aufsätze, und Reden* (1902). His later works include *Regierung und Volkswille* (1914, 1920); *Bismarcks Erbe* (1915), *Krieg und Politik*, 3 vols (1919), *Geschichte der Kriegskunst*, 4th vol. (1920), *Kaustsky und Harden* (1920), *Ludendorff, Tirpitz, Falkenhayn* (1920), *Ludendorffs Selbstportrait* (1922), *Vor und nach dem Weltkrieg* (1925).

#### DEMENTIA PRÆCOX. See INSANITY

**DE MOLAY**, ORDER OF. A nonsectarian secret organization for young men between the ages of 16 and 21, founded in 1919 by Frank S. Land in Kansas City, Mo., and named in honor of Jacques De Molay, the last military grand master of the Knights Templars. The members are pledged to the precepts of love of parents, reverence, patriotism, cleanliness, courtesy, comradeship, fidelity, and to the promotion of the public-school system and good citizenship. The order is governed by a grand council of Freemasons, while the chapters are sponsored by Masonic bodies or groups of Masons. In November, 1929, there were 1759 chapters, 250,000 members, and more than 200,000 De Molays who had outgrown active membership. Frank S. Land, the founder, was grand scribe. The headquarters of the order are in its own building, The Shrine of Youth, at 201 East Armour Boulevard, Kansas City, Mo.

**DENBY**, EDWIN. American lawyer and Secretary of the Navy, 1921-24, died suddenly in Detroit, Mich., Feb. 8, 1929. Born in Evansville, Ind., Feb. 18, 1870, he accompanied his father, then U. S. Minister to China, to that country in 1885 and served in the Chinese Imperial Maritime Customs Service, 1887-94. Returning to the United States, he was graduated from the law school of the University of Michigan in 1896. Admitted to the bar in the same year, he practiced at Detroit until the Spanish-American War, 1898, when he enlisted in the Navy and served as gunner's mate on the USS *Yosemite*. After that war, he returned to Detroit and resumed his law practice until seated, as a Republican, in the Michigan House of Representatives, 1903. The following year, he was elected to the Fifty-ninth Congress, serving until 1911. On his return to Detroit, he continued the practice of law and also became associated with several automobile manufacturing concerns, being one of the original stockholders of the Hupp Motor Company. When the United States entered the World War, 1917, Mr. Denby enlisted as a private in the marines, and having been promoted through the grades, was commissioned major in the reserves, Jan. 1, 1919. Again in Detroit, he was appointed chief probation officer of the Recorder's Court in December, 1920. He once more entered the services of the national Government when President Harding appointed him Secretary of the Navy, May 4, 1921, the first service man to hold that position. It was Mr. Denby who, as head of the Navy Department, signed the papers transferring Teapot Dome and the Elk Hills Naval Oil Reserve to the Department of the Interior, thereby becoming connected with the discussions which followed. He resigned on Mar. 10, 1924, after President Coolidge had refused to act upon a resolution of the Senate, of February, 1924, requesting that the President require the resignation of his Secretary. Mr. Denby returned to his private busi-

ness in Detroit, and in the decision on the subsequent oil-lease trial, Feb. 28, 1927, the U. S. Supreme Court stated that there was no evidence that the Secretary had taken any active part in the fraud.

**DENISON-PENDEE**, SIR JOHN. DENISON Sec. PENDER, SIR JOHN. DENISON DENISON-

**DENISON UNIVERSITY**. A coeducational Baptist institution of higher education in Graustville, Ohio, founded in 1831. The enrollment for the autumn of 1929 was 852 and for the summer session of 1929, 164. The faculty in the autumn of 1929 totaled 66, of whom 50 were men and 16, women, and of the total 4 men and 3 women were new additions. The amount of endowment of the university was \$3,520,000, the net income for the year was \$152,000. There were 70,000 volumes in the library. On Nov. 18, 1929, the university launched a campaign to raise \$3,300,000 for buildings and endowment in view of the coming centennial celebration in 1931. For immediate construction were a new library, administration building, biology building, conservatory of music, and auditorium. President, Avery Albert Shaw, D. C. L., D. D.

**DENMARK**. The smallest of the three Scandinavian states, comprising the peninsula of Jutland with its adjacent islands in the Baltic, the Faroe Islands, a part of Schleswig as a result of the plebiscite of 1920 under the terms of the Treaty of Versailles, and Greenland, the only colony or possession. Iceland is a free sovereign state, but united to Denmark under the King of Denmark, who is also head of the Government of Iceland Capital, Copenhagen (See GREENLAND, ICELAND).

**AREA AND POPULATION**. The area is 16,568 square miles, including the Faroe Islands, which have an area of 540 square miles, population, according to the census of Nov. 5, 1925, 3,434,555. The population of which voted in the plebiscite of 1920 to form a part of Denmark, had an area of 1502 square miles and a population in 1925 of 176,433. The islands in the Baltic had an area of 5133 square miles and a population of 1,575,533 in 1925. Of the population more than 95 per cent were born in Denmark. The movement of population in 1927 was: Living births, 68,024, deaths, 40,190, marriages, 26,199. The surplus of births over deaths fell from 34,814 in 1925 to 27,834 in 1927. Emigration (chiefly to the United States and Canada) in 1927 totaled 7996 (5804 in 1926). The population of Copenhagen in 1925 was 587,150, with suburbs, 731,496. Other large cities with their 1925 populations are Aarhus, 76,226, Odense, 62,376, Aalborg, 42,812, Horsens, 28,135, and Randers, 26,856.

**EDUCATION**. Primary instruction is free and compulsory between the ages of 7 and 14. In 1927 there were 4482 lower schools, of these 31 were maintained by the National Government, 3868 by the local communes, and 580 were private institutions. The number of pupils in the lower schools on Jan. 1, 1927, was 487,083. For higher education, there is the University of Copenhagen, founded in 1479, with about 120 professors and 4400 students. There are also many popular high schools, agricultural schools, training schools for teachers, and other technical special institutions.

**PRODUCTION**. Having virtually no basic natural resources such as coal and iron, agriculture has of necessity assumed primary importance in Danish economy, although industrial development is

not lacking. As agriculturists, the Danes have achieved notable progress. About 78 per cent of the total area is under cultivation, and supports about 35 per cent of the population. For many years, the government has fostered the division of the land into small parcels. A recent survey shows that 13,800 small farms, with a total area of 81,543 acres, have been established through grants and state loans since state aid was adopted in 1899. Loans and grants made by the government to aid the small farmers aggregate about 140,000,000 crowns (\$37,380,000). About 92 per cent of all farmers now own the land they cultivate. A feature of the economic organization of the country is the prevalence of cooperative societies, particularly in agricultural lines. Ninety per cent of all Danish farmers are members of cooperative dairies and 70 per cent of cooperative slaughterhouses. In 1926-27 Danish agriculture suffered from a severe depression due to small crops and low prices, but the situation improved in 1928 and in 1929 the Danish farmers appeared again on the road to prosperity. A census taken July 15, 1928, showed the cultivated area to be divided as follows: grain, 3,238,000 acres, root crops, 1,271,000, other crops, 78,000, green fodder and grass, 2,125,000, fallow land, 180,000; total, 6,892,000. Agricultural products constitute three-fourths of the value of Denmark's annual exports, and exports of butter and bacon account for two-thirds of all exports. In 1928 there were in Denmark 518,000 horses, 3,021,000 cattle, 3,360,000 swine, and 18,000,000 hens.

The fisheries, in which some 12,800 boats are engaged, support a considerable portion of the population. In 1927 the total catch amounted to about 84,000 metric tons, valued at 33,800,000 crowns (1 crown equals \$0.2680 par value, exchange value in 1928, \$0.2674).

Standardization and the consolidation of industry, together with higher costs in competing countries, have enabled Denmark to regain some of the ground lost during the post-war industrial depression. Latest available statistics place the number of factories and industrial shops at 89,175, employing altogether 392,000 persons. Industries manufacturing for home consumption include textiles, clothing, tobacco, soap, building materials, paper, pewter and silver ware, and foodstuffs. Meat packing, dairying, and the manufacture of machinery, automobiles, electrical equipment, cement, wire and cables, vegetable oil, and porcelain are carried on for both export and domestic consumption.

The marked improvement in general industrial conditions is indicated by the fact that imports of iron and steel products in 1928 totaled 318,738 metric tons, as compared with 295,048 metric tons in 1927. Much of the imported iron and steel was used in the shipbuilding industry, which produces most of the world's motor ships. Forty new vessels launched in 1928 totaled about 138,800 gross tons, placing Denmark fourth in the production of new ships. Total production is valued at about \$25,000,000 annually. In the first half of 1929 conditions in the industry improved still more markedly and there was a steady increase in the activity of foundry and machinery plants and in bridge construction.

In 1927 electrical equipment manufactured in Denmark was valued at 30,000,000 crowns, the cable production reached 5675 metric tons as against 1754 in 1913, the output of iron and steel wire, 20,800 metric tons, as against 11,800

tons in 1913. In the same year, the production of vegetable oils was 88,000 metric tons and of fodder products, 193,000 metric tons, the exports of the industry totaling 37,000,000 crowns.

**COMMERCE.** Since 1927 Denmark has ranked first among European nations in the value of exports per capita and in the per-capita total foreign trade. In both quantity and value, her foreign trade is now well above the pre-war level. In 1928 imports were valued at 1,734,000,000 crowns and exports, at 1,653,000,000 crowns, a total of 3,387,000,000 crowns, as compared with a total of 1,576,000,000 crowns in 1913 and 3,208,000,000 crowns in 1927. In the latter year, imports totaled 1,658,800,000 crowns and exports, 1,549,200,000 crowns. Quantitatively, the annual foreign trade amounts to about 12,000,000 metric tons, of which imports constitute about 84 per cent. The imports are divided into finished manufactures, 26 1/2 per cent, raw materials for agriculture, such as fertilizers and fodder, 23 per cent, foodstuffs, 15 per cent, mineral oils, 8 1/2 per cent, raw materials for industry, 13 1/2 per cent; semi-manufactured materials, 13 1/2 per cent. In 1929 the value of imports rose to 1,792,000,000 crowns and exports, to 1,707,000,000 crowns, according to preliminary returns.

Exports of meat and butter were valued at 507,000,000 crowns in 1928 (223,000,000 crowns in 1913), packing-house products, pork, and meat at 182,000,000 crowns in 1928 (184,600,000 in 1913), manufactured products, 300,000,000 crowns in 1928. Fish, flint, and chalk are other exports.

Great Britain purchases 56 per cent of all Danish exports, Germany, 21 per cent, and Sweden, Norway, and Holland the bulk of the remainder. One-third of Danish imports come from Germany, 14 per cent from Great Britain, and 13 per cent from the United States. Imports from the United States consist mainly of grains and animal fodder, machinery and automobile parts for assembly, mineral oils, flour, cotton, fruit, rubber products, and tobacco. In 1929 the trend was toward a more favorable balance of trade, an increased trade with Great Britain, and a marked decline in imports from Germany.

**FINANCE.** The considerable deficits which characterized the Government's financial operations after 1920 have been virtually eliminated in the past few years for both ordinary and extraordinary accounts. Direct and indirect taxes are still comparatively high and account for about 80 per cent of the total ordinary revenue. The budget for the fiscal year ending Mar. 31, 1929, balanced at 412,404,000 crowns, with current revenues estimated at 324,338,000 crowns and current expenditures at 319,433,000 crowns. Preliminary returns indicated that there would be a surplus of 1,000,000 crowns from the year's operations. The budget for 1929-30 provided for current revenues of 319,573,000 crowns and revenue from state capital of 43,598,000 crowns, for current expenditures of 313,288,000 crowns and expenditure for the increase of state capital of 57,620,000 crowns. Major items of current expenditure were: Ministry of Public Instruction, 62,089,719 crowns, Interior, 62,140,116 crowns, Health, 41,789,551 crowns, War, 36,400,017 crowns, Finance, 22,770,113 crowns, Marine, 22,321,137 crowns.

The public debt on Mar. 31, 1928, stood at 1,172,000,000 crowns, or about 340 crowns per capita. The debt is entirely funded and is held in

Denmark for the most part. The national wealth is estimated at above 10,000,000,000 crowns and the net private debt owed abroad at 995,000,000 crowns. The Danish crown has been stable at \$0.286 since Denmark returned to the gold exchange standard in January, 1927.

Den Danske Landmandsbank in Copenhagen, the reconstruction of which was undertaken with the aid of the Danish government through a \$55,000,000 loan floated in Europe and the United States in April, 1928, reported a steady and sound development during 1928, having on Jan. 1, 1929, liquid assets of about 64 per cent of its demand liabilities, with an additional 31 per cent of partially liquid assets. The government subscribed 50,000,000 crowns of new capital of the bank. The report showed gross profits of 7,397,213 crowns for the year 1928.

COMMUNICATIONS On Dec. 31, 1928, the Danish merchant marine (exclusive of colonies) possessed 2013 vessels of 1,120,139 registered tons gross. In 1926, 33,073 vessels of 10,431,000 tons entered the Danish ports from foreign countries and 34,649 vessels of 10,608,000 tons cleared. The total length of railways open to traffic was 3219 miles, of which 1526 belonged to the state. The total value of state railways up to Mar. 31, 1928, was 446,351,000 crowns. In 1929 the state railways were experimenting with new types of steam, Diesel motor, and gasoline locomotives.

GOVERNMENT Executive power is vested in the King, who acts through a responsible ministry, but who has no power to declare war or make peace without the consent of the Rigsdag, or Parliament, and the legislative power is vested in the Rigsdag, which is composed of the Folketing (lower house) and the Landsting (upper house). The Folketing has 149 members, of whom 117 are elected on the basis of proportional representation and the remainder divided among the parties not having obtained sufficient returns at the district elections, the Landsting has 75 members, elected indirectly by the voters for the lower house and the former Landsting. The composition of the Landsting after the election of September, 1928, was as follows: 28 Liberals, 27 Socialists, 12 Conservatives, and 8 Radicals. The Folketing, elected December, 1926, consisted of 61 Social Democrats, 43 Agrarians, 24 Conservatives, 16 Radicals, 3 Justice party representatives, and 1 from the Sleavig (German party). King in 1929, Christian X (born Sept. 26, 1870), who succeeded his father, Frederik VIII on May 14, 1912. The ministry as formed following the elections to the Folketing on April 24 was headed by Th. Stauning, a Socialist who was Prime Minister during 1924-26. It also included M. Bismansen as Finance Minister, M. Munch as Foreign Minister, M. L. Rasmussen as Minister of Defense, and M. Steuicke as Minister of Social Welfare.

HISTORY The question of the reduction of national defense forces which had agitated Danish politics for a number of years became a critical issue in 1929. In October, 1924, the Stauning (Socialist) Ministry introduced bills abolishing conscription and cutting naval and land forces to a minimum which would have reduced the annual item of military and naval expenditure from 60,000,000 crowns to about 12,000,000 crowns. The bills were defeated in both houses. The succeeding Madsen-Mygdal ministry attempted to effect a compromise between the demands of the Left and Centre groups, which favored reduction of armaments, and those of the

Conservative groups, which opposed reduction, by offering a defense budget of 40,000,000 crowns. This did not satisfy the Left and Centre, however, and the budget bill was rejected Mar. 21, 1929, the dissolution of the Folketing following on April 23. Besides their disarmament stand, the Socialists and Radicals campaigned for the abolition of the Upper Chamber, or Landsting, and the introduction of a one-chamber system.

At the election of April 24, about 52 per cent of the voters supported the Socialist-Radical disarmament policy, defeating the government parties by a 100,000 majority. The new cabinet (see above, under *Government*) presented its disarmament bill to the Folketing on October 3. It provided for the abolition of the army, navy, and private military forces, and the substitution of a defense corps of 1500 enlisted men, to be known as constables and to serve for patrol purposes only, a state marine of about 13,000 tons for coast guard and fishery duties, the abolition of the War and Navy ministries, the supreme command of the defense forces to be placed in the hands of the Ministry of State; demolition of present fortifications, and strict regulation of the manufacture and sale of munitions. The total national defense budget under the proposed system was estimated at 19,000,000 crowns. The bill provides further that after being passed by both chambers of Parliament, it must be approved by a national referendum before becoming a law.

The theory behind the move for disarmament was that small and exposed nations such as Denmark are incapable of real self-defense under modern conditions of warfare. Premier Stauning said it was also the opinion of his supporters "that we have good reason to give, in international relations, a good example in a question which has become the most serious burden of all peoples, and an obstacle to the furtherance of cultural advance."

The possibility remains that the Upper House, in which the Conservatives still controlled a majority, might defeat the bill as it did a similar one in 1926. In this case, the proposed reform would go over until 1932, the earliest date at which the abolition or reform of the Landsting could take place. Unemployment, social insurance, and the improvement of farming, industry, and the crafts were other problems to which the new government was devoting itself. The question of home rule for the Faroe Islands was again debated during the session of the Faroe Lating which closed September 26.

DENVER, UNIVERSITY OF A coeducational institution of higher learning in Denver, Colo., founded in 1864. The registration for the autumn of 1929 totaled 2685 as follows: Graduate school, 54; college of liberal arts, 940; school of engineering, 167; school of law, 74; school of dentistry, 49; school of commerce, 802; art school, 77; and city college, 522. There were 969 students enrolled in the 1929 summer session. The faculty had 176 members. The library contained more than 50,000 volumes. The Margery Reed Memorial Hall, a class-room building with offices for professors, was completed during 1929. Chancellor, Frederick M. Hunter, Ed.D.

DEPAUW UNIVERSITY. A coeducational institution for higher learning in Greencastle, Ind., under the auspices of the Methodist Episcopal Church, founded in 1837. For the autumn session of 1929, the enrollment was 1803, including 888 men and 715 women. Of this number,

1420 were registered in the college of liberal arts and 174 in the school of music. In the summer session of 1929, there were 102 students. The college of liberal arts had a faculty of 91 members and the school of music a faculty of 16. During the year, there were appointed a professor of mathematics, and assistant professors of economics, English literature, and sociology. The productive funds of the university amounted to \$5,414,124, including assets of the Rector Scholarship Foundation amounting to \$2,206,642. The income from productive funds was \$272,850, while the total current income for the year was \$613,442, \$118,308 of the income from productive funds was for scholarships.

In June, 1929, six new Rector fellowships for graduate work in institutions to be chosen by the students receiving them were awarded, these fellowships carrying a stipend of \$1200 each. In September, the Rector's Scholarship of History, carrying a stipend of \$300 a year, was established. Among the important gifts received during the year was a bequest of \$1,000,000 from the late Frank Hall and of \$100,000 from Mrs. Larz Whitcomb to establish the Larz Whitcomb Chair of Sociology. The library contained 69,050 volumes. On Oct. 12, 1929 (Home-Coming Day), the corner stone was laid of Asbury Hall, a recitation and lecture hall which was being erected at a cost of \$250,000. Plans also were developed for the erection of Gohn Memorial, a recitation and lecture hall for religious education, to cost \$100,000, of a new science hall for the departments of biology and geology to cost \$250,000, and of a new auditorium with a seating capacity of 2500 to cost \$250,000. President, G. Bromley Oxnam, D.D., LL.D.

**DETROIT, UNIVERSITY OF.** An institution of higher education in Detroit, Mich., under the auspices of the Roman Catholic Church and conducted by the Jesuit Fathers; founded in 1877. In the autumn of 1929, there were 3715 students registered, distributed as follows: Arts and sciences, 597, engineering, 1301, commerce and finance, 1032, law, 220, foreign trade, 59, Saturday and Thursday extension school, 268. The summer-school registration was 220. The faculty numbered 200. The productive funds in 1929 totaled \$1,218,446. There were 52,000 volumes in the library. President, the Very Rev. John P. McNichols, S.J., Ph.D., LL.D.

**DEWEY, JOHN.** See PHILOSOPHY.

**DIABETES.** Dr. E. P. Joslin, well-known authority on diabetes, writes a practical article for the benefit of the patient and his family physician on the subject of preventing diabetic coma. The patient is presumed to be under the favorable influence of diet and insulin, one or the other or both (*Journal of the American Medical Association*, July 6). Every patient, no matter how complete his resources for heading off coma, should be trained to avoid this possibility. He must never omit his insulin as long as there is the least sugar in the urine, even if on a rigid diet, and the more so if he is not. If he suffer from some intercur-

rent disease, like a severe cold, he is under no condition to stop his insulin, but if anything to take it oftener and in larger doses. If in spite of all he begins to feel ill, he is to go to bed after summoning his medical attendant and a nurse, drink a cup of hot water every hour; take an enema; keep warm in bed, and have boiled water ready on the stove in order that the doctor or nurse may at once inject a quart of it subcutaneously. The doctor is to wash out the stomach and place the patient on fluid diet with caffeine as a heart stimulant. Dr. Joslin evidently attaches no importance to frequent tests of the urine for the ketone bodies supposed to usher in acidosis and coma, as he does not mention these.

**DIABETES IN CHILDREN.** Dr. E. P. Joslin and Dr. Priscilla White give some statistics of a series of 303 diabetic children seen over a period of about two years. The death rate for six years in this class of patient had been constant at 2 per cent. All deaths had been due to coma, which implies neglect. The present status of the children was good and they matured normally. While under diet and insulin their resistance to accidental infection is normal, although in the long-standing cases some sugar persists in the urine. The reactions to insulin are disagreeable but not dangerous. Since evidence goes to show that diabetes in early life is due to hereditary factors, the triumph of treatment is the more remarkable. There is nothing to prevent these children from marrying when they grow up and they are in urgent need of companionship—of some one to take an interest in them and make them attend to their treatment. The inability to metabolize carbohydrates will not of course be overcome but it may be that these unfortunates may have compensations. It was found recently that they suffer less from dental caries than the average when under full diabetic management and the value of insulin is a broad one and may secure to the patient advantages other than the holding in check of diabetes (*Journal American Medical Association*, January 12). See INSULIN.

**INCREASING INCIDENCE OF DIABETES.** The figures of the Metropolitan Life Insurance Company show that despite the great value of insulin in the treatment of diabetes, the disease is on the increase, a fact to which attention was called in 1927. There was a further rise in the following year, while during the early part of 1929, the death rate of 23.8 per 100,000 population was the highest ever recorded by the Metropolitan. Insulin has kept down what would have been a still higher rate. How many patients are receiving insulin today? According to the insurance company named, over half the sufferers. An analysis of one group of 1044 fatal cases showed that 63 per cent had received it to some extent, but, of this fraction, 46 per cent had received it too late to be of benefit. Insulin, it must be remembered, is not a cure and not a preventive. Given properly and faithfully, it enables a person to live with his disease and in spite of it and in good health for many years, perhaps until his original expectation of life is realized. The slight reduction in the percentage of deaths due to diabetic coma is a tribute to the efficacy of insulin. It must be remembered that many diabetics fall an easy prey to other diseases, such as influenza and pneumonia. See FOOD AND NUTRITION.

**DIAGHILEV, SERGEI.** The famous creator of the Russian Ballet, died in Venice, Aug. 19, 1929. He was born in Novgorod, Mar. 19, 1872. Al-

though graduated from the Petrograd Conservatory with honors, in 1892, he did not take up music as a profession, but devoted himself to journalism and began to arrange exhibitions of modern art. In 1899 he founded an art journal, *Iskusstvo*, which attained great vogue, but was forced to suspend publication in 1905, owing to unfavorable conditions brought about by the Russo-Japanese War. In 1899 he also became connected with the ballet of the Imperial Russian Theatre in Moscow, and there he found sympathetic understanding of his original ideas in Michael Fokin, the director, and Léon Bakst, the painter. Enthusiastic collaboration of these three men resulted in the development of the ballet by coordinating dancing, stage decorations, costumes, lighting effects, and music, thus fusing these concomitant elements into a homogeneous whole. The beginning was made with ballets in the regular repertory. Then, influenced by the art of Isadora Duncan, choreographic actions were adapted to famous instrumental works, such as Rimsky-Korsakov's *Scheherazade*, Strauss's *Till Eulenspiegel*, Debussy's *Après-midi d'un Faune*, etc. About that time, Diaghilev first met Stravinsky, who was then entirely unknown, but whose style of music seemed to fit admirably into the general scheme of the reformers. Accordingly, the young musician was commissioned to write the music to *L'Oiseau de Feu*. In the spring of 1909, Diaghilev took the Moscow troupe to Paris for the ostensible purpose of introducing Russian operas in which the ballet figured extensively. Incidentally, separate performances were given also of standard ballets, and these met with even greater favor than the operas. Diaghilev now severed his connection with the Moscow organization and formed his own company, the Ballet Russe, with which he visited Paris in 1910, scoring a sensational success with the first production of Stravinsky's *L'Oiseau de Feu*. The next year, the same composer's *Petrushka* was acclaimed with equal enthusiasm and London fully endorsed the verdict of Paris. Two years later, these phenomenal successes were even eclipsed by *Le Sacre du Printemps*, and the demand for ballets in the new style led Diaghilev to commission new works from various composers of established reputation, among them R. Strauss, Debussy, Ravel, Hahn, Tcherepnin, Dukas, Milhaud, Bartók, Wellesz. Even conservative New York gasped and was completely carried away when the new art was first introduced there in 1910. After 1921 Diaghilev divided his activity mainly between Paris and London.

**DIAMONDS** During 1929 the diamond market of the world remained stable due to the continued control of the Diamond Syndicate and the extreme caution used by the South African Government in marketing stones from the government workings in Namaqualand, where there had been extraordinary finds of diamonds. This region and the adjacent territory in Southwest Africa continued to be the leading centres of interest, but accurate statistics regarding production were not forthcoming during the year. For 1928, however, the Namaqualand output was officially stated as 900,493 carats, making a total for the Union of South Africa of 4,372,857 carats. These and other figures led to an estimate of the world total for 1928 as about the same or possibly slightly in excess of the record year 1927, when the total output was 7,363,000 carats. In 1929 various causes seemed to be responsible for a decrease in South African

production, with an estimated total of 3,800,000 carats. The Namaqualand territory had produced in less than two years diamonds valued at \$35,000,000, with a future production worth \$5,000,000 a year indicated for 10 years. The government placed only about half of the stones recovered at its diggings on the market, holding the remainder for future sales.

While the South African production dropped in 1929, there were increases in southwest Africa, the Gold Coast, and Tanganyika. New finds were announced from British Guiana indicating an increase, while Congo and Angola were expected to equal the 1928 production, making a total world output for 1929 of 7,000,000 carats. See SOUTH AFRICA, under *Production*.

An interesting feature of the year was the development of the diamond-cutting industry in South Africa, with 17 establishments in operation in August as compared with 11 in January. In 1929 there were imported into the United States rough, uncut diamonds to the amount of 354,415 carats valued at \$9,885,072, as compared with 201,302 carats valued at \$11,935,191 in 1928. Stones cut but not set were imported in 1929 to the amount of 416,992 carats valued at \$42,009,583, as compared with 440,437 carats valued at \$42,390,162 in 1928. As usual, the Netherlands and Belgium were the leading sources of cut stones in the 1929 supply, 179,009 carats valued at \$19,044,681 being imported from the Netherlands, and 200,673 carats valued at \$17,150,410 from Belgium.

**DICTIONARIES.** See PHILOLOGY, MODERN.  
**DIESEL ENGINES.** See INTERNAL COMBUSTION ENGINES, ELECTRIC RAILWAYS, SHIPBUILDING, SHIPPING.

**DIET.** See FOOD AND NUTRITION.

**DIPHTHERIA.** It has been assumed that when a patient recovers spontaneously from a mild or moderate case of diphtheria, this is due to the formation in the blood of antitoxin which neutralizes the toxin of the disease, and naturally in the malignant case there is lack of ability to produce this antitoxin, but according to Hamburger and Seigel (*Munchener medizinische Wochenschrift*, September 13), study of the blood of some patients with cases so mild that antitoxin was thought unnecessary may show that the patient has not formed this protective substance so that his recovery could hardly be attributed to that event, while on the other hand, the blood did contain the toxin of the disease and the patient therefore was suffering from the latter in latent form, even though in relative health. The so-called diphtheria carrier is known to harbor bacilli somewhere in the body, but has not, so far as known, harbored the toxin in his blood. Should these results be upheld, diphtheria will not be so simple an affection as we have believed, for it will be evident that some substance other than antitoxin has protected him from the disease. For the vast majority of patients, the situation will be quite unchanged, but we shall have to recognize the existence of paradoxical exceptions to the general rule and seek out the unknown immunizing substance.

**DISARMAMENT.** See LEAGUE OF NATIONS, MILITARY PROGRESS, NAVAL PROGRESS, PEACE AND PEACE MOVEMENTS.

**DISCIPLES OF CHRIST.** A communion, known also as the Churches of Christ, which

sprang from a movement for Christian unity, in American Presbyterian circles at the beginning of the nineteenth century under Barton W Stone in Kentucky and Thomas and Alexander Campbell in western Pennsylvania. This is the largest religious body having its origin in America and in 1929 ranked fifth among Protestant communions in the United States. In polity, the churches are congregational. There were six major agencies of the denomination in 1929. The United Christian Missionary Society; board of education, board of temperance and social welfare, Association for the Promotion of Christian Unity, pension board, and the missionary societies of the different States and provinces of Canada. These agencies are corporations and are related in an advisory way to the International Convention of the Disciples of Christ which meets annually in the late summer or early autumn. The total church membership throughout the world in 1929 was 1,668,500, and 117 over 1928. In the United States the membership in 1929 was 1,573,245, a gain of 34,880. The Bible-school enrollment for the world was 1,201,885 and for the United States and Canada, 1,128,090. During 1929, 57 young people's conferences were held, a gain of 12 over the previous year. Contributions reported for the fiscal year in the United States and Canada totaled \$3,647,787. The church erection fund amounted to \$2,677,793.

The general missionary work of the church is organized under the United Christian Missionary Society, with headquarters at 222 Downey Avenue, Indianapolis, Ind., its board of managers of 120 is composed of an equal number of men and women. The foreign missionary work of the church in 1929 embraced the Belgian Congo, China, India, Jamaica, Japan, Mexico, Philippine Islands, Porto Rico, Argentina, Paraguay, and Tibet (Batang, on the border). During the year, there were 5610 baptisms in the foreign field. The 510 mission schools had a total enrollment of 11,916, and the denomination maintained 16 hospitals and 19 dispensaries which administered 434,791 treatments, an increase of 85,214 over the previous year. Mission work in the United States was conducted among the French, Highlanders, immigrants, Negroes, Orientals, Latin-Americans, and Mexicans. The department of benevolence maintained six homes for children, an equal number of homes for the aged, and one hospital. In 1929, 28 colleges cooperated with the board of education, and the denomination maintained Bible chairs in four State universities. Among the periodicals published by the communion are the *World Call*, *Christian Evangelist*, and *Christian Unity Quarterly*. The president of the International Convention in 1929 was Harry H. Rogers of Tulsa, Okla. The Rev. F. W. Burnham of Indianapolis, Ind., was president of the United Christian Missionary Society.

**DISEASES OF PLANTS.** See BOTANY.

**DIVORCE.** See MARRIAGE AND DIVORCE.

**DOCKS, DRY DOCKS.** See PORTS AND HARBORS.

**DOGS.** The year 1929 again made clear that dogs and dog shows and the sport of showing dogs had become increasingly popular. The Westminster Kennel Club show in New York in February was considered the biggest and most important show of all and attracted an entry of over 2000 dogs, some exhibitors traveling from California and other distant corners of the country to show their

pets and strive to win the award for "Best in Show," emblematic of the best dog in the United States. In 1929 this signal honor was captured by Laund Loyalty of Bellhaven, a magnificent collie puppy owned by Mrs. Florence B. Ilich of Red Bank, N. J. The youngster swept all before it and was acclaimed the best specimen in the show.

The remarkable thing noticed at all the important shows of the country, the Westminster, the New Haven, Boston, Baltimore, Chicago, San Francisco, and others, was the enormous increase registered by the Boston terriers. This breed led all others in number of entrants in most of the shows, and was recognized as one of the most popular of all dogs. For years this breed was considered an outcast of the streets of Boston, but of late years has been barking at the doors of fame and at last has been admitted. There are many fine qualities to the breed and it is on a par with the wire-haired fox terrier group as a favorite with most dog fanciers. Some other breeds showed a marked decline. The Eskimos, the field spaniels, and the English bulldogs were seen to be fading out, and they failed to attract public fancy. These breeds were never in great demand, but they showed a greater decrease in 1929 than ever before. It is noteworthy that only one of each of these three types of dogs was entered in the Westminster Show at Madison Square Garden in New York City.

During the year, the wire-haired fox terriers held their tremendous popularity, while the other terriers also did well, notably the Cairns and the Scotties. Then, too, the cocker spaniels increased in number and quality until that breed had gotten up among the leaders at many of the shows. It was a great year for varieties and to a greater degree than ever before thoroughbred dogs are displacing those of uncertain pedigree as household pets.

The real merit of the blood dogs came to the fore prominently in 1929, as more and more breeders sent to England for pedigreed dogs. The importations stood the test well, and seem to have a slight advantage over the domestic animals.

**DOLLS, INTERNATIONAL.** See INTERNATIONAL-1531.

**DOMESTIC RELATIONS COURTS.** See CHILD WELFARE.

**DOMINICA.** See LEeward ISLANDS.

**DOMINICAN REPUBLIC (SANTO DOMINGO).** A West Indian state occupying the eastern part of the island of Haiti, the western part of which is occupied by the Republic of Haiti. Capital, Santo Domingo. See HAITI.

**AREA AND POPULATION.** The estimated area is 19,332 square miles. Population, according to the census of 1921, 897,405. The largest cities with their populations at that census were Santo Domingo, 30,957, Santiago de Los Caballeros 17,052, San Pedro de Macoris, 13,802, and La Vega, 6564. The population was estimated at 1,022,485 at the beginning of 1928.

**PRODUCTION.** The Dominican Republic derives its income almost entirely from the cultivation of the soil. Sugar is the major crop, contributing 62 per cent of the total exports in recent years. Cacao, tobacco, and coffee, also are important crops. Except in the provinces of Seybo and San Pedro de Macoris, which are given over almost entirely to the raising of sugar cane, the economic condition of the local population is largely determined by the production and prices obtained

for these secondary crops. Thus, prosperity was fairly prevalent during 1927, despite the depression in the sugar industry, due primarily to large crops of cacao and tobacco with favorable prices. In 1928 crops were generally smaller than in the preceding year and the prices obtained for them considerably lower. By the middle of the year this situation was reflected in unfavorable business conditions and a decrease in government revenues.

Conditions generally improved somewhat toward the end of 1929. The sugar yield for the 1927-28 season was 412,380 short tons, an increase of 23,372 tons over the 1926-27 total, but the prices received were lower. For the 1928-29 season sugar production decreased to 396,575 short tons. The 1927-28 cacao crop was below average, being estimated at 45,000,000 pounds, as compared with 58,450,000 pounds in 1926-27, and prices declined during 1928. In 1928-29 the crop was estimated at 48,000,000 pounds. The export value of the tobacco crop in 1928 was about \$1,500,000, as compared with \$2,582,000 in 1927. Of the 27,500,000 pounds of tobacco produced in 1928, 25,000,000 pounds were exported. In 1927 exports totaled 44,750,000 pounds. The coffee crop available for export in 1928-29 was placed at 8,000,000 pounds, as compared with 9,025,000 in 1927-28. Exports of coffee in 1928 were valued at \$2,135,682, in 1927 at \$1,749,522. Diversification of agriculture was being sponsored by the government, which had also reclaimed 3000 acres of arid land by irrigation at a cost of about \$700,000. A colonization policy under which 500 families were settled on reclaimed lands and other public lands was being carried out, principally in the western part of the republic.

The Dominican Republic contains about 9,500,000 acres of forests and numerous mineral deposits, including gold, copper, iron, petroleum, and some coal.

**COMMERCE.** Dominican imports and exports showed a decided drop in 1928, imports totaling \$26,787,940 (\$27,784,014 in 1927) and exports, \$28,754,528 (\$31,178,709 in 1927). As usual, the United States supplied more than half of the imports, valued at \$16,374,110. The nearest competitors for the Dominican market in 1928 were Germany, which supplied \$1,400,082 of the imports, British India, \$1,437,809, and the United Kingdom, \$1,304,497. The principal articles of import in the order of their importance were foodstuffs, cotton and its manufactures, iron and steel manufactures, mineral oils, machinery and apparatus, vegetable fibre and its manufactures, automobiles, and hides and leather goods.

The United Kingdom was the republic's best customer in 1928, taking exports to the value of \$12,790,850, as compared with purchases of \$6,510,963 by the United States, \$2,848,677 by France, \$1,828,189 by Canada, and \$1,516,440 by Porto Rico. Principal exports were sugar, \$19,384,418, cacao, \$4,250,415; coffee, \$2,135,682, tobacco, \$1,348,958. Other exports were hides and skins, corn, honey, molasses, plantains, woods, and vegetable fibres.

The volume of foreign trade in 1928 while considerably below the record year of 1927, was higher than in any of the other immediately preceding years. A distinct improvement was noted toward the end of 1929.

**FINANCE.** The budget deficit at the beginning of 1929 amounted to \$1,631,277, which had accumulated since 1924 at the rate of \$408,000

annually. In the 1928 budget revenues were estimated at \$12,505,400 and expenditures at \$12,172,828. The slackening of economic activity during the year, however, caused a considerable reduction in revenues and the Government was forced to suspend construction on a number of public works. The Government's share of the customs receipts, which are handled by a receiver appointed by the United States, was \$3,776,647, instead of the \$4,800,000 estimated. Total customs collections for the year were \$5,290,308, the remainder going for the service of loans and the cost of the receivership. The Dawes Mission (see below, under *History*) estimated that appropriations under the 1929 budget would exceed receipts by \$4,127,000. The mission placed the total debt at \$22,650,000 in 1929, of which \$20,000,000 was bonded indebtedness. The continued deficits revealed by the mission were not shown in the closed accounts which, for instance, placed the actual surplus for 1927 at \$962,080. The discrepancies were attributed by the experts to the lack of a central accounting system. It was said to be common knowledge among Dominican politicians, however, that many of the unlisted appropriations were passed out as political patronage.

**COMMUNICATIONS.** In 1926 there were 149 miles of railway besides 255 miles of private lines on large estates. The total highway mileage in 1927 was 557. Road construction proceeded rapidly in 1928 with the aid of loans floated in the United States. The road budget for 1928 was \$1,306,500. The merchant marine consists of 30 small steamers engaged mostly in coastwise trade. There are 1034 miles of telegraph line and a telephone system owned and operated by the government, with 2383 instruments in 1924. An air-mail line linking the republic with the United States was inaugurated in January, 1929.

**GOVERNMENT.** The Republic is governed under a constitution adopted by the Constituent Assembly on June 13, 1924. Executive power is vested in a president and cabinet of seven ministers. The president is ineligible for a second successive term. The senators and deputies are elected for four years by direct popular vote. Each of the 12 provinces is represented by one senator and (in practice) by two deputies. President in 1929, Horacio Vasquez, who assumed office on July 12, 1924, vice president, Frederico Velazquez. On May 7, 1929, a law was approved providing for the reorganization of the government into the following departments: Executive, Interior and Police, Foreign Relations, Treasury, Justice and Public Education, National Defense, Promotion and Public Works, Agriculture and Commerce, Health and Social Welfare.

**HISTORY.** A commission of American financial experts, headed by former Vice President Charles G. Dawes, visited the Dominican Republic during April, 1929, at the invitation of President Vasquez, studied the financial situation, and submitted a report recommending the adoption of laws regulating the budget, state accounting, public improvements, and certain changes in departmental organization. A number of these recommendations were later adopted by Congress.

On March 11, the Dominican Congress ratified a treaty settling the boundary with Haiti. The U. S. Department of State on Oct. 19, 1929, announced the appointment of Charles Evans Hughes, former Secretary of State, as chairman of the United States committee to cooperate with

the Pan American Union in forwarding the project for the construction of a monumental light-house on the coast at Santo Domingo in honor of the memory of Christopher Columbus. A bill appropriating the sum of \$871,655 as the contribution of the United States toward the project was introduced into Congress.

Conditions in the Republic were reported none too stable toward the end of the year, particularly after President Vasquez went to the United States to undergo serious surgical operation. Following the outbreak in Haiti in December, several Dominican cabinet members were said to have conferred with the American High Commissioner in Haiti regarding the possibility that the trouble would spread across the border.

**DOUBINE ERADICATION.** See VETERINARY MEDICINE.

**DRAINAGE.** See RECLAMATION.

**DRAKE UNIVERSITY.** An institution for the higher education of men and women in Des Moines, Iowa, founded in 1881. The number enrolled in the autumn of 1929 was 1736, distributed as follows: College of liberal arts, 538, commerce, 292, education, 340, lay, 81, fine arts, 407, and Bible, 82. The faculty numbered 90. The fixed endowment amounted to \$1,363,076. The number of volumes in the library was 53,029. President, Daniel W. Morehouse, Ph.D.

**DRAMA.** See THEATRE and articles on LITERATURE, ENGLISH AND AMERICAN, FRENCH LITERATURE, GERMAN LITERATURE, ETC.

**DUBOIS, CARDINAL LOUIS ERNEST.** A French prelate, died in Paris, Sept. 23, 1929. He was born Sept. 1, 1850, in St. Calais, Sarthe, and educated there and at Précigné and Le Mans. In 1879 he was ordained a priest. In 1895 he was curate at Saint-Benoît au Mans, Bishop de Verdun in 1901, Archbishop of Bourges in 1909, of Rouen in 1916, of Paris in 1920. In 1916 he was created cardinal-priest. Cardinal Dubois was active in the post-war reconciliation of Church and State in France. He was a knight of the Holy Sepulchre and an emeritus member of the Academy of Saint Thomas Aquinas.

**DUFFIELD, WAITER GEOFFREY.** English astronomer and director of the Solar Observatory of the Australian Commonwealth died in August, 1929. He was graduated from the University of Adelaide in 1900 and from Cambridge University in 1903, and he received the doctor of science degree from the University of Manchester in 1908. As an honorary research fellow at the University of Manchester, he carried on experiments with the effect of pressure upon arc spectra, and in 1906-07, working on a MacKinnon studentship awarded by the Society, and influenced by Sir Arthur Schuster, he presented four memoirs on the effect of pressure upon arc spectra to the *Transactions of the Royal Society*. From 1911 to 1923, he was professor of physics at University College, Reading, England, and also dean of the faculty of science. Here, he studied the carbon arc further and published papers on this subject in the *Proceedings of the Royal Society*. Dr. Duffield in 1912 discovered the existence of minute repulsion between the poles of a carbon arc, around which discovery he carried on experiments.

The results of his careful study of the value of gravity over the ocean, made on a voyage to Australia and back in 1914, were published in the *Proceedings of the Royal Society*. In 1908 he was chosen secretary of the committee appointed to

aid in the work of establishing a solar observatory in Australia, and in 1923, on its foundation, Dr. Duffield became the first director of the Solar Observatory of the Australian Commonwealth at Mount Stromlo, Canberra, Australia. During the World War, he served in the Royal Air Force.

**DUISBURG ANNIVERSARY.** See CELEBRATIONS.

**DUKE, BENJAMIN NEWTON.** American capitalist, died in New York, Jan. 8, 1929. Born in Orange (now Durham) Co., N. C., Apr. 27, 1855, he was graduated from Guilford College, N. C. As a boy, he aided his father and brother on a small tobacco farm, which later developed into the W. Duke Sons & Co. tobacco factory at Durham, N. C. The firm grew rapidly, and in 1880 merged with the American Tobacco Company, of which Mr. Duke was treasurer and director until the company was dissolved as a monopoly by the U. S. Supreme Court, 1911. While in business, Mr. Duke remained in Durham, becoming president of the Durham & Southern Railway, and the Erwin Cotton Mills Company, vice president of the Durham Hotel Company, and the Southern Power Company, and director of the Durham Realty Corporation. He was instrumental in reorganizing Trinity College, Durham, as Duke University, which James B. Duke, his brother founded.

**DUKE UNIVERSITY.** An institution for higher education in Durham, N. C., established in 1924 by the expansion of Trinity College, made possible through benefactions from James B. Duke, as described in the article on the university in the 1925 YEAR BOOK. Enrollment for the fall of 1929 was 2027, distributed as follows: Undergraduates, 1721, school of religion, 96, law school, 50, students in other graduate schools, 160. For the summer session of 1929 there was an enrollment of 1406. In the autumn of 1929 the faculty, including officers but not staff assistants, numbered 243 and in addition there were 74 teachers in the 1929 summer school who were not included on the regular staff of Duke University. The endowment funds of the university amounted to \$21,017,966, and the income for the year was \$1,107,355. Gifts received during the year 1928-29 amounted to \$29,000, while the Angier B. Duke Memorial Student Loan Fund exceeded \$1,250,000 in value. The library contained 143,000 books and 22,000 catalogued pamphlets. In the fall of 1930, the present university campus was to be opened as a coordinate college for women, remaining as it has been a distinct unit of Duke University. The undergraduate college for men and the several graduate schools were to be moved to a 4,500-acre tract of land, approximately a mile distant from the campus, on which there had been erected a group of buildings, built of native North Carolina stone of the Cambrian formation, taken from a quarry owned by Duke University President, William Preston Few, Ph.D., LL.D.

**DUNKERS or DUNKARDS.** See BRETHREN, CHURCH OF THE.

**DUTCH EAST INDIES.** A possession of the Netherlands in the East Indies, comprising the territory of Dutch East India and consisting of the group of islands in the Pacific lying between 6° N. and 11° S. latitude and between 95° and 141° E. longitude. Capital, Batavia.

**AREA AND POPULATION.** The usual method of dividing the colony is as follows: (1) Java and

Madura, divided into 17 residencies, each under a resident and several assistants at the head of a large number of native officials; (2) the Outposts, consisting of Sumatra, Borneo, Celebes, a part of New Guinea, the Molucca Archipelago, the Sunda Islands and other small islands, under functionaries variously entitled governor, resident, controller, etc. The area is estimated at 733,642 square miles, population, according to the census of 1926, 51,881,862, of whom 36,901,643 were in Java and Madura. On Jan. 1, 1928, the population of Java and Madura was 37,384,343, including 174,036 Europeans, 463,507 Chinese, and 34,545 Amins.

**PRODUCTION** Agriculture is the basic industry of the islands. In Java and Madura in 1927, there were 18,173,000 acres, or 56 per cent of the total area, under native cultures; 1,623,000 acres, or 5 per cent of the total, in European-operated plantations, and 7,437,000 acres of government forests. Unusually large harvests were obtained of virtually all crops in 1928. Prices were somewhat lower than in 1927. The production of the principal crops for the years 1926, 1927, and 1928 is shown in the accompanying table.

CROP PRODUCTION DUTCH EAST INDIES  
[In thousands of units]

Product	1926	1927	1928

<sup>a</sup> Java, seasons ended the following year.

<sup>b</sup> Java and Madura. <sup>c</sup> Exports. <sup>d</sup> Estate production.

The effect on the rubber industry of the abandonment of restrictions on exports from British areas was less severe than was expected, but considerable uneasiness continued among rubber growers. Of the 1,250,000 to 1,500,000 acres planted to native rubber, about 400,000 acres were in production in 1928.

An appropriation of 6,000,000 florins (\$2,400,000) for the commencement of work on a ten-year project for the irrigation of 227,000 acres in the Celebes was contained in the budget for 1930. A second project for the irrigation of 87,400 acres located in Central Celebes was begun in 1929.

The output in 1927 of the tin mines, part of which are worked by the Government, was 560,567 piculs (of 133 pounds) from 11 mines, 1,620,205 metric tons, of mineral oil, 3,693,870,000 kilogrammes. Tin production was slightly larger in 1928, although prices declined somewhat. Petroleum output also increased through the opening up of several large producing wells in eastern Java.

**COMMERCE** An 11 per cent increase in imports and a decline of 2½ per cent in exports marked the foreign trade of the islands in 1928. The drop in exports was due almost entirely to the decline in the price of rubber. The comparative values of leading import commodities in 1928 and 1927 and of leading export commodities in

1927 and 1928 are given in the accompanying table. According to preliminary figures, 1929 imports, including parcel post and gold and silver, totaled 1,162,179,000 florins (\$467,195,000) and exports, 1,481,024,000 florins (\$595,372,000).

Imports of textiles and yarn during 1928 increased nearly 20 per cent in quantity, those from the United States reaching the record value of \$800,000. Imports of oil-well drilling machines, sewing machines, iron and steel manufactures, automobiles and automobile tires also increased, the United States supplying 79 per cent of the latter two articles. Of the export commodities, rubber, tobacco, and petroleum were the only leading ones to show decreases in value.

PRINCIPAL COMMODITIES IN DUTCH EAST INDIES TRADE  
[In thousands of dollars]

	1926	1927
<b>IMPORTS</b>		
Fish, dried or salted	\$ 6,862	\$ 6,561
Rice, clean	38,824	26,797
Tobacco, leaf or cut	7,851	8,851
Cotton piece goods	60,349	69,293
Jute bags	9,030	7,748
Textile manufactures, other	9,588	10,429

Tin, crude	21,407	16,811
Copra	29,313	42,580
Total exports	\$651,777	\$632,442

In 1927, 22 per cent of the total trade was with Singapore, 17½ per cent, with the Netherlands, 13½ per cent, with the United States, and 9½ per cent, with the United Kingdom.

**FINANCE** The budget adopted for 1929 estimated revenues at 815,781,393 guilders and expenditures at 869,799,890 guilders, leaving a deficit of 54,018,503 guilders, as compared with an estimated deficit of 55,066,234 guilders in 1928. The deficit was accounted for mainly in connection with extraordinary services. The chief items of revenue estimated for 1929 were direct and indirect taxes, 326,000,000 guilders, salt monopoly, 18,324,200 guilders, pawnshops, 21,892,000 guilders, opium, 44,531,000 guilders, railway service, 84,244,000 guilders, post, telegraph, and telephone services, 30,874,000 guilders, harbor service, 13,236,000 guilders, forestry, 20,375,000 guilders, tin, 51,075,000 guilders.

The world prices of tin and rubber had an important bearing upon the government's revenues, as in 1926 and 1927, when high prices for these staples caused the anticipated deficits in the budgets to be converted into surpluses. The com-

paratively low prices obtaining for both products in 1929 gave little promise that the anticipated deficit would be reduced.

The public debt was 1,011,677,000 guilders on Dec. 31, 1928. The note circulation on Nov. 2, 1929 was 307,000,000 florins (123,567,000).

**COMMUNICATIONS** In 1928, 21,002 vessels aggregating 11,127,000 tons entered the ports of the Dutch East Indies and 18,193 vessels of 10,959,000, cleared. In 1927 the length of railway and tram lines was 4507 miles, of which 3379 were in Java and 1099 in Sumatra, gross receipts were about 127,904,823 guilders, and operating expenses, 80,031,884 guilders. The length of government lines was 7593 miles, of government telephone lines, 14,315 miles. There were also 21 government radio telegraph stations.

A fortnightly air-mail service from Europe to Java was started in September, 1929.

**GOVERNMENT** The territory is under the sovereignty of the Netherlands (see NETHERLANDS, THE), but is partly under direct government and partly under subject native officials. In 1917 and again in 1925, the mother country granted certain measures of home rule. The chief executive authority is the governor-general who is aided by a council of five members which acts partly as a legislative and partly as an advisory body. The Volksraad is a legislative assembly including representatives of the natives, Europeans, and foreign Orientals, and has comparatively little power in internal affairs. In 1929 the Dutch Parliament passed a law providing for a native instead of a Dutch majority in the Volksraad, which will henceforth consist of 30 natives, 25 Dutch, and a maximum of five foreign subjects, such as Chinese. The Governor-General and the council are nominated by the Crown Governor-General in 1929, A. C. D. de Graeff, appointed Mar. 26, 1926.

**DUTCH GUIANA**, *gê-u-na*, or **SURINAM**. A possession of the Netherlands on the north coast of South America lying between French Guiana on the east and British Guiana on the west, bounded on the south by inaccessible territory reaching to the Tumuc-Humac Mountain Area, 54,291 square miles population, Dec. 31, 1927, 117,700. Negroes and Indians Capital, Paramaribo. 45,703 inhabitants. The movement of population in 1927 was Births, 3481, deaths, 2107, marriages, 440. Among the chief products are sugar, cacao, bananas, coffee, rice, maize, rum, and molasses. Gold production in 1927 was 239,796 grams, and that of balata, 770,000 kilos. Local revenues are insufficient to meet expenditures and the state provides an annual subvention, which in 1929 amounted to 2,463,000 guilders. In the same year, the local revenue was estimated at 5,551,000 guilders and expenditure at 8,414,000 guilders (1 guilder, or

florin, equals \$0.4020). The executive authority rests with a governor and an assisting council, both nominated by the Crown. Governor in 1929, Dr. A. A. L. Rutgers, appointed Apr. 1, 1928.

**DUTCH REFORMED CHURCH.** See REFORMED CHURCH OF AMERICA.

**DUTCH WEST INDIES.** The name applied to the Dutch possessions in the West Indies, viz., Dutch Guiana and Curaçao. Consult those titles.

**DVOŘÁK ANNIVERSARY.** See MUSIC.

**DWIGHT, JONATHAN.** An American physician and ornithologist, died in New York, Feb. 22, 1929, where he was born Dec. 8, 1858. He was graduated from Harvard in 1880. After studying engineering, he turned to medicine, receiving the M.D. degree from the College of Physicians and Surgeons, Columbia University in 1893. He served as assistant surgeon in the department of laryngology of the Vanderbilt Clinic, 1894-1904. His greatest interest, however, was in the study of ornithology and he accumulated one of the most important collections (over 60,000 specimens) of North American birds in existence, which he kept in the American Museum of Natural History. Dr. Dwight served as president of the Linnæan Society (1900-21), receiving a medal from that association in February (1929), was president of the Ornithologists' Union at the time of his death, having been made a fellow in 1886, and treasurer in 1905, and was treasurer of the Audubon Society. He also belonged to numerous other scientific societies, including the International Ornithological Congress, and the British Ornithological Union. His most valuable work was Dr. Dwight's - *On the Ornithology of the World*, published by the American Museum, he also wrote *A Study of the Birds of the World*.

**DYNAMO ELECTRIC MACHINERY.** In the field of large generators for turbine drive, the most interesting feature of the year was the design of a 110,000-kilowatt unit, the turbine of which was to operate with steam at 1200 pounds pressure. This unit, being built by the General Electric Company for the Ford Motor Company, was to be a cross compound design consisting of a 1200-pound steam turbine with its generator developing 55,000 kilowatts at 1800 revolutions per minute on one shaft and a low-pressure turbine and its 55,000-kilowatt generator on another shaft. The high-pressure unit will be mounted on top of the other and the steam, after passing through the high-pressure turbine, will be reheated and passed through the other turbine.

The accompanying table gives a list and brief description of the outstanding examples of turbo-generators completed in 1929 and installed and operating.

TURBO-GENERATORS FOR 1929

Purchaser	Kva	Speed	Voltage	Shaft	Manufacturer
State Line Generating Co.	235,000	1,800	22,000	3	G. E.
United Electric Light & Power Co.	188,400	1,800	13,800	2	West.
United Electric Light & Power Co.	188,250	(L.P. 1,200)	(H.P. 1,800)	2	A. B. B.
American Gas & Electric Co. . . . .	187,000	1,800	11,000	3	G. E.
N. Y. Edison Co. . . . .	180,000	1,500	11,400	1	G. E.
Brooklyn Edison Co. . . . .	187,500	1,800	13,800	2	West.
Southern California Edison Co. . . . .	100,000	1,500	16,500	1	G. E.
Union Electric Light & Power Co.	83,333	1,800	13,800	1	G. E.

G. E. = General Electric Co. West. = Westinghouse E. & M. Co. A. B. B. = American Brown Boveri Co.

In the field of water-wheel driven generators, the record for size again was broken by the construction of four generators of 77,500 kv-a. at 88 revolutions per minute which have an overall diameter of 40 feet and are the largest of water-wheel generators both as to bulk and capacity. They are of the fabricated and welded steel-plate type of construction which is now common and which causes a considerable saving in weight and bulk. The next largest machines, those installed at Conowingo and in operation in 1929, are of 40,000 kv-a. at 82 revolutions per minute. In operation these machines have shown an efficiency of 98 per cent at rated load and unity power factor.

The following list comprises the more important machines ordered or installed during the year.

WATER-WHEEL DRIVEN GENERATORS FOR 1929

Purchaser	No	Kv a	Speed	Manufacturer
Dnieprostroy Hydroelectric Development	4	77,500	88 2	G E
Lexington Power Co	4	40,025	135	West
Philadelphia Electric Co (Conowingo)	4	40,000	81 8	G E
	3	40,000	81 8	West
New England Power Co	4	39,000	138	West
Brazzian Hydroelectric	1	35,000	125	G E
Southern California Edison	1	35,000	375/450	G E
Alabama Power Co	2	29,000	100	West
Norwood Electric Co	2	27,500	90	A C
City of Los Angeles	1	25,000 (Hor)	143	A C
Montana Power Co	1	25,000	81 8	West
Norwood Electric Co	1	22,500	75	A C

A C = Allis Chalmers Co

An increasing percentage of large generators, particularly those for steam stations, were designed for operation at the higher voltages, such as 22,000, and a British manufacturer built some generators to give 33,000 volts.

The problem of operating machines of such large capacities in a network introduced serious problems of controlling these enormous values of power in case of trouble caused by breakdown, such as a short circuit, or sudden increases or decreases in the load. To meet these conditions, the engineers introduced the "high-speed circuit breaker" and "high-speed excitation." The former acts to cut out a defective line or part of the network in a small fraction of a second ( $\frac{1}{50}$ ), and the latter will adjust the voltage of each generator, upward or downward in a very short period, thus making for a steady voltage which does not give even "winks" of the lights.

Among transformers, a record for capacity was made in a self-cooled single-phase transformer for 40,000 kv-a. at 60 cycles. While there has been no tendency to increase the operating potential of transmission lines and transformers above the established values of 220,000 volts, an increasing proportion of transformers built are designed for the high voltages, 220,000, 160,000, and 132,000 volts. This has introduced problems of internal insulations which have been met by one company by the "non-resonating" type of transformer.

In this type, a metallic shield must be placed inside the transformer near the high-voltage windings, so that the dielectric field from conductor to the ground is controlled by this shield and each turn of the coil has an electro-static potential to ground proportional to its real voltage to ground, thus dividing the strain on the insulation as if there were only continuous voltages present.

Some large auto-transformers of the water-cooled type were built having a capacity of 83,333 kv-a. at 25 cycles, equivalent to a two-circuit transformer of 49,800 kv-a. Another large self-cooled, 60-cycle, auto-transformer is noteworthy in having an efficiency of 99.7 per cent at about 35,000 kv-a. output.

The use of Mercury Arc Rectifiers for the conversion of alternating current into direct current continued to increase. For railway work, they have become particularly popular because they are more adaptable to the higher voltages, 600, 1500, and 3000, of railway work than the low voltages, 125 and 250, of industry and domestic systems. A noteworthy installation was one of 6500-kilowatt capacity at 650 volts in one tank for the Consolidated Mining & Smelting Co of British Columbia.

#### EARTH, STUDY OF SEE GEOLOGY

**EARTHQUAKES.** It is estimated that an earthquake is felt in some part of the world on an average of at least 4000 times annually, in the United States alone, 200 or more are usually reported each year. Fortunately, the vast majority either are feeble and harmless, or occur under the sea or in thinly populated regions. The year 1929 had the usual quota of quakes, many of which resulted in more or less local damage and loss of life, and a few of which ranked as severe disasters. A number of heavy quakes occurred under the oceans, the Aleutian Islands region being particularly active.

Cumana, Venezuela, which has been destroyed by earthquakes several times in its history, was again laid in ruins on January 17, about 50 people were killed, and 800 injured. The longest and most severe quake ever recorded in the region of Fairbanks, Alaska, occurred on January 21, 14 shocks were felt in four hours. The Tajikistan region of central Asia was shaken on February 1 and several villages were destroyed. A disastrous quake took place in Khovans, Persia, May 1, a large area was devastated, with great loss of life.

An earthquake in New Zealand on June 17 was the strongest felt in that country since 1855. The greatest damage was caused at Westport, Greymouth, and Murchison, the loss of life was small. Severe aftershocks took place on June 23. The quake was remarkable for the great distance to which the sounds accompanying the shock were heard. The centre was on the White Creek fault, differential displacements of the order of 14 feet occurred, and one area 50 by 18 miles was raised as much as 16 feet in some places. On the west coast at Whitecliffs, a strip of sea bottom was uplifted into a ridge a quarter-mile long and 60 yards wide. The uplift at Murchison amounted to about four feet.

New York State and surrounding regions were shaken on August 12; the damage, mostly to chimneys and walls, was confined largely to the town of Attica. An unusually powerful quake, which must have been of the highest order of intensity at the epicentre, occurred November 18 off the southern coast of Newfoundland. It shook New England and eastern Canada, being felt along 940 miles of the American coast, and sea waves swept in over the southern shores of Newfoundland, two and one-half hours after the shock, to a height of 100 feet in some places, drowning 26 people and devastating the region. The area of the disturbed region has seldom been exceeded in the quakes of the last 50 years. The shock broke 12 submarine cables in at least 23 places, 10 of these were transatlantic cables. The cable breaks occurred mainly on two roughly parallel lines along a continuation of the trough-like valley through Cabot Strait, over this submarine-rift valley the ocean is hundreds of fathoms deeper than on either side, reaching 285 fathoms in places; and the quake was probably due to a fresh subsidence of the bottom of the rift. See PHYSICS.

**EAST AFRICA PROTECTORATE.** See KENYA COLONY.

**EBERLE,** REAR ADMIRAL EDWARD WALTER, U S N, RRT American naval officer, died July 6, 1929, in Washington, D C. He was born in Denton, Tex., Aug. 17, 1864, and in 1885 was graduated from the United States Naval Academy. He rose to the rank of rear admiral in 1929. During the Spanish-American War, he served on the *Oregon*, and also in the Philippine insurrection of 1899. Later in that year, he became an aide to the superintendent of the Naval Academy. In 1913-14 he was at the Naval War College, where he prepared mine-laying and mine-sweeping tactics of the United States Navy. He was in command of the Navy Yard and the naval gun factory at Washington in 1914-15, and from 1915 to 1919, was superintendent of the United States Naval Academy. He was in command of the Pacific Fleet in 1922-23 and of the Battle Fleet in 1922-23. After 1923 until 1928, the year of his retirement, he was chief of naval operations. As early as 1913, he proposed using airplanes to study the depth at which submerged submarines might be seen from the air, and he was among the first officers to suggest the use of the smoke screen in naval warfare.

**ECLIPSES.** See ASTRONOMY.

**ECOLOGY.** See ZOOLOGY.

**ECONOMIC ASSOCIATION, AMERICAN.** An organization founded in 1885 in Saratoga, N. Y., to encourage economic research, especially the historical and statistical study of the actual conditions of industrial life, to issue publications on economic subjects, and to encourage perfect freedom of thought and discussion upon current problems from an economic point of view. The membership, which in 1929 totaled approximately 3500, comprises persons interested in the study of political economy or the economic phases of political and social questions. During the first 25 years of its existence the association published mainly monographs on special economic topics, dealing largely with current problems, which make up 28 volumes and furnish the best existing guide to the progress of economic thought in the United States. The official periodical is the

*American Economic Review*, a quarterly founded in 1911, which aims to supply material showing the progress of economic thought. Papers read at meetings are published in the *Proceedings* of the association and furnished free to members.

The association, which holds one meeting annually, met in Washington on Dec. 27-30, 1929. Among the topics discussed at this meeting were "The Corporation, the Investor, and the State"; "Marketing—Modern Tendencies in Food Distribution"; "The Public Works Plan and Unemployment"; "The Theory of Economic Dynamics as Related to Industrial Instability"; "The Chief Economic Problems of Mexico"; "The Reparations Settlement and the International Flow of Capital"; and "The Federal Reserve Board—Its Problems and Policy." The officers of the association for 1929 were President, Edwin F. Gay, Harvard University, vice presidents, Winthrop M. Daniels, Yale University, and Waddill Catchings, New York City, counsel, John E. Walker, Washington; and secretary and treasurer, Frederick S. Deibler, Northwestern University. The elected members of the executive committee were Fred R. Fairchild, Yale University, George W. Dowrie, Stanford University, William H. Kieckhefer, University of Wisconsin; Edmund E. Day, New York City, Ernest L. Bogart, University of Illinois, and Richard T. Mly, Northwestern University.

**ECONOMIC ENTOMOLOGY.** See ENTOMOLOGY, ECONOMIC.

**ECONOMIC GEOLOGY.** See GEOLOGY.

**ECONOMICS.** See BANKS AND BANKING, BUSINESS REVIEW, FINANCIAL REVIEW, LITERATURE, ENGLISH AND AMERICAN, PUBLIC FINANCE STATISTICS, ETC.

**ECONOMIZERS.** See BOILERS, STEAM.

**ECUADOR,** ek'wa-dōr. A South American republic on the northwest coast of the continent between Colombia on the north and Peru on the south. Capital, Quito.

**AREA AND POPULATION.** The area in 1929, still undetermined because of the boundary dispute with Peru, was variously estimated at from 116,000 to 276,000 square miles. The population is estimated at from 1,500,000 to 2,000,000 and includes about 601,219 inhabitants of pure European blood, 291,000 of mixed blood, and 600,000 Indians, of whom 200,000 are savages virtually untouched by civilization. In 1927 there were 89,423 births, 47,065 deaths, and 12,935 marriages. The last official census in 1903 placed the population at 1,328,821. The chief towns with their populations are Quito, 80,702; Guayaquil, 100,000; Cuenca, 30,000; Riobamba, 12,000; and Ambato, Loja, and Iatacuanga, each with about 10,000 inhabitants.

**EDUCATION.** Elementary instruction is free and compulsory. Institutions of higher learning include the Central University at Quito, the Guayas University in Guayaquil, and the Azuay University in Cuenca. There is also a law college at Loja. In 1928 there were 1771 government, municipal, and primary schools, with 2399 teachers and 128,746 enrolled pupils.

**PRODUCTION.** Primarily an agricultural country, the bulk of Ecuador's income is derived from the cultivation of cacao, sugar, coffee, cotton, ivory nuts, corn, rice, fruits, and similar products. Rubber, cinchona bark, kapok, and bloom, macora, and toquilla straw are other important vegetable products. Cacao is the most important crop both in Ecuadorian export trade and in its

effect on general economic conditions. The plantations have suffered greatly, however, from inroads of the witchbroom and Monilia diseases and production decreased by 50 per cent between 1913 and 1928. Receipts of cacao at Guayaquil for export, which represent from 85 to 90 per cent of the total crop, decreased from 87,111,000 pounds in 1913 to 43,518,000 pounds in 1927 and 42,537,000 pounds in 1928. Observers report that production of cacao is likely to remain permanently at a low level. The 1929 production, however, was estimated at 48,000,000 pounds, slightly above that of the preceding year. Ecuador, which was the foremost producer of cacao in 1905, dropped to fifth place in 1927. To this decline is attributed a business depression which has continued for the past few years and became even more pronounced in 1928 and 1929, when the world prices for cacao dropped.

The coffee crop, which goes mainly to European nations, was estimated at between 22,000,000 and 25,000,000 pounds in 1928. The 1929 production showed a decrease of about 20 per cent. Rubber and tagua (ivory nut) production declined during 1929, exports of rubber to the United States from Guayaquil dropping from \$158,899 in 1927 to \$88,000. Sugar production approximated 20,091 long tons for the 1927-28 season and 22,400 long tons, for 1928-29. The tobacco industry, which has been encouraged by the Government, is showing considerable expansion, the output being 220,460 pounds in 1927, 544,711 in 1928, and 660,000 (estimated) in 1929. The cotton crop was about 2,430,520 pounds in 1927-28.

Gold, silver, petroleum, copper, iron, coal, and sulphur exist in commercial quantities. Gold is the chief mineral mined, the exports in 1927 amounting to 4,766,128 sucres (one sucre equals \$0.20). Petroleum production increased from 5,866,202 gallons in 1925 to 17,101,466 in 1927. The Panama-hat industry was dull in 1928, exports of the United States valued at \$998, as compared with \$720,490 in 1927. The textile industry, which is the chief manufacturing enterprise of the country, showed some improvement.

**COMMERCE.** According to preliminary figures, imports in 1928 were valued at \$16,779,000, an increase of 46 per cent over the previous year, and exports at \$19,571,000, an increase of 7 per cent. Smaller exports of gold bullion accounted for about half the decline which occurred in the export surplus.

Exports of the principal commodities in 1928 (with 1927 figures in parentheses) were as follows: Cacao, \$5,904,000 (\$7,001,000), coffee, \$3,439,000 (\$1,817,000); crude petroleum, \$2,316,000 (\$997,000); tagua nuts, \$1,250,000 (\$1,094,000); rice, \$560,000 (\$207,000); fruits, \$330,000 (\$278,000); hides, 395,000 (\$221,000); gold bullion, \$972,000 (\$2,744,000). The chief imports are foodstuffs, textiles, machinery, hardware, minerals, drugs, and vehicles. Trade between Ecuador and the United States increased in 1928, the exports to the United States rising in value from \$5,193,000 in 1927 to \$5,346,000 and imports from the United States increasing from \$5,531,000 in 1927 to \$6,595,000.

**FINANCE.** The extended business depression has been reflected in the increasing difficulty which the Government has experienced in balancing the budget. In 1927, the latest year for which figures are available, actual ordinary receipts amounted

to 65,150,000 sucres and ordinary expenditures to 71,646,000 sucres. In the original budget estimates for 1928 and 1929, ordinary receipts and expenditures balanced at 51,588,000 sucres and 59,900,000 sucres, respectively. The 1929 estimates were modified by decree of the Council of State on Sept. 4, 1929, to balance at 63,324,575 sucres. Customs collections and port dues, the most important source of governmental income, amounted to 26,728,000 sucres in 1928, an increase from similar receipts of 22,072,000 sucres in 1927. Actual ordinary expenditures in 1927 were distributed (in sucres) as follows: debt service, 25,446,000; national defense, 9,051,000; public instruction, 5,515,000; social welfare, 1,585,000; public works, 9,323,000; all others, 20,720,000.

The preliminary budget for 1930 calculated revenues at 60,150,000 sucres, or 3,174,576 sucres less than in the budget for 1929. Export duties were estimated to yield 4,500,000 sucres in 1930, as compared with 6,170,000 in 1929. The expected reduction in revenue was attributed by President Ayora to "the difficult economic situation faced by the country as a result, largely, of the cacao pest and the 1929 floods." To avoid a threatened deficit, the salaries of the President and cabinet officials were reduced by 25 per cent and those of subordinate public officials in proportion. On the other hand, salaries of teachers, postal employees, and army officers were raised. Appropriations for all departments except those of public instruction, agricultural development, and the interior were cut down.

A distinctly noticeable improvement in the service of the external debt occurred in 1928. The external debt on Jan. 3, 1929, was \$19,645,000 and the internal debt on Oct. 9, 1928, totaled \$3,725,000. The Central Bank of Ecuador received new-type coins to the value of 1,420,160 sucres from the United States Philadelphia Mint in 1929 which were used to replace old copper and nickel coins.

**COMMUNICATIONS.** In 1929 there were nine railway lines in Ecuador with a total length of 698 miles. The office of Public Works calculated the value of the nine lines at 10,150,925 sucres, the average annual appropriation in the budget for the payment of employees and the acquisition of materials at 6,482,400 sucres, and the prospective earnings for 1930 at 8,700,000 sucres. Most of the highways are little better than bridle paths, many being closed for half of the year. The budget for 1929 contained \$420,000 for highway construction. An air passenger and mail service between Quito and Guayaquil was opened in August, 1929. Other air routes connect Ecuador with cities in Panama and Colombia. Guayaquil is a port of call for steamships of nine European lines. During 1927, 424 steam vessels of 1,029,095 net tonnage entered, and 417 vessels of 998,120 net tonnage cleared, the port.

**GOVERNMENT.** Under the constitution, executive power is vested in the President elected for five years, who acts through a cabinet of six ministers; and legislative power in the Congress of two Houses, the Senate of 32 members and the Chamber of Deputies of 48 members. A new constitution, adopted by the Constitutional Assembly in October, 1928, was proclaimed Mar. 25, 1929, by President Ayora, and a new cabinet was appointed May 7, 1929, by the President. The members were Dr. Teofilo Fuentes Robles, Minister of Government and Social Welfare, Gonzalo

Zaldumbide, Foreign Relations, Dr Manuel Maria Sanchez, Public Education; Julio E. Moreno, Public Works, Agriculture, and Promotion, Juan de D. Martinez, Treasury and Public Credit, Colonel Carlos A. Guerrero, War, Navy, and Aviation.

**HISTORY** The military dictatorship under which Dr. Isidro Ayora had ruled the country as Provisional President from 1926 on, was ostensibly ended in 1929 with the proclamation of the new constitution adopted in 1928 (see above, under *Government*). The Constitutional Assembly elected Dr. Ayora the constitutional President for a term of five years on Mar. 27, 1929, after revising the constitution so as to legalize the election. His inauguration took place April 12. Under the constitution, the President is not eligible for reelection in 1934. Dr. Ayora polled 42 of the 50 votes cast, there being two other candidates. Under his leadership, it was expected that the recommendations of the Kemmerer Commission, most of which have been adopted, would be carried to fruition. His régime has been marked by the creation of a central bank, an agricultural credit bank, the stabilization of the currency, the balancing of the budget, the adoption of a general banking law, the prosecution of an extensive public-works programme and advanced labor legislation. His Liberal supporters wrote into the new constitution provisions safeguarding Ecuador's control of her natural resources, and taking the control of elementary and secondary education out of the hands of the Roman Catholic Church. The latter measure provoked demonstrations in the capital.

In elections held at the close of October, the Liberals won a complete victory over their Conservative opponents. President Ayora adopted a policy of drastic economy during the year in the face of falling revenues. The ministers of Finance and of Public Welfare resigned toward the end of the year and the President experienced difficulty in filling the vacancies. The latter post was finally accepted by Francisco Boloma, a member of the cabinet during the military dictatorship of 1925 and the former by Sixto Duran, former collector of customs at Guayaquil. A dispute between Harry Tompkins, American Superintendent of Banks in Ecuador, and Saucedo de Tejada, then Minister of Finance, engaged the attention of the country early in the year. The Minister imposed a heavy fine on Mr. Tompkins for alleged invasion of his powers, but the latter, who had full control of all national funds, refused to approve the fine. Dr. Homero Viteri Lafonté, formerly Foreign Minister of Ecuador, assumed the post of Minister to Washington in October, 1929, succeeding Gonzalo Zaldumbide.

**EDUCATIONAL PSYCHOLOGY.** See **PSYCHOLOGY**.

**EDUCATION ASSOCIATION, NATIONAL.** See **NATIONAL EDUCATION ASSOCIATION OF THE UNITED STATES**.

**EDUCATION IN THE UNITED STATES.** **PROPOSED FEDERAL DEPARTMENT OF PUBLIC EDUCATION.** The agitation for a Federal department of public education continued throughout the year. Representative Robison of Kentucky introduced a bill in the House of Representatives which provided for the creation of

race, creed, or color, shall have larger educational opportunities and thereby abolish illiteracy, make more general the diffusion of knowledge, and provide for the general welfare, but without impairment of or the infringement upon the laws, the rights, duties, authority, or responsibilities of the several States, Territories, and the Citizens thereof, with respect not only to the public educational agencies and institutions but likewise as to the private educational institutions and agencies in the several States and Territories.

The bill provided for a Secretary of Education to be appointed by the President by and with the advice of the Senate. The Secretary of Education would have a place in the President's cabinet. The salary attached to the position was to be \$15,000.

The bill provided for the transfer of the Bureau of Education to the new department. The office of Commissioner of Education was to be abolished and all of his duties were to be exercised by the Secretary of Education. Section 7 of the Bill defined the scope of the secretary's responsibilities in regard to the collection of statistics and facts as follows:

The Department of Education shall collect such statistics and facts as shall show the condition and progress of education in the several States and Territories. In order to aid the people of the several States and Territories to establish more efficient schools and school systems, to devise better methods of organization, administration, and financing of education, to develop better types of school buildings and provide for their use, to improve methods of teaching and develop more adequate curricula and courses of study, investigations and studies shall be undertaken in (1) rural education, (2) elementary education, (3) secondary education, (4) higher education, (5) professional education, (6) physical education, including health education and recreation, (7) special education for the mentally and physically handicapped, (8) the training of teachers, (9) immigrant education, (10) adult education, and (11) such other fields as in the judgment of the Secretary of Education may require investigation and study to promote generally the welfare of education throughout the United States and its possessions.

The sum of \$1,500,000 was authorized to be appropriated for the purpose of the payment of salaries and the conduct of studies and investigations, the payment of incidental and traveling expenses incurred in connection with the investigations and inquiries undertaken by the department, and for law books, books of reference, and periodicals, and for the payment of rents whenever necessary, and for such other purposes as may be necessary to enable the Department of Education to carry out the provisions of the act.

One of the most interesting sections of the Bill was that relating to a National Council of Education. The following is the wording of Section 10:

There is hereby created a National Council on Education to consult and advise with the Secretary of Education on subjects relating to the promotion and development of education in the United States and in its possessions, which national council shall consist of the several State superintendents of education or other State chief educational authorities by whomsoever known, and one member from each of the United States possessions, namely, Alaska, Hawaiian Islands, Philippine Islands, Porto Rico, and Isthmus of Panama. The Secretary of Education shall be chairman of said council. The members of said council shall meet for conference once each year at the call of the Secretary of Education, they shall serve without pay, but their actual expenses incurred in attending the conferences called by the Secretary shall be paid by the Department of Public Education.

It was difficult to form any accurate judgment regarding the possibility of such a department being formed. Educational journals gave a very pronounced expression to the desires for such a department. Some important civic organizations advocated its establishment. On the other side, there were some influential bodies that opposed

A Department of Public Education, to aid and encourage the public schools and promote the public educational facilities of the Nation, so that all the people of the several States and Territories, without regard to

any attempt on the part of the Government to deal with education. The claim was made that the States should have full authority to deal with public education within their borders and that this would become impossible if the Government exercised even such limited authority as the bill provided.

**MOTION PICTURES IN SCHOOL** For several years, a group of experts had been investigating the influence of motion pictures in classroom instruction. For this purpose, various topics were developed and various methods of treatment were employed. Twelve cities cooperated in the experiment. In all, nearly 200 teachers and 10,000 children took part. The results showed that those who made use of the motion pictures were better able to deal with the examinations that were set than were the other classes. In some cases the difference was very marked.

Coincident with this investigation, there were a variety of efforts to develop more practical apparatus for the use of the schools. It had become possible for the teacher to operate the machine herself while she was in her class room among the boys and girls. Many schools were equipped with motion-picture apparatus, and there was an increasing supply of suitable films. During the year, the American Museum of Natural History made it possible for schools outside of New York City to use the science films that had proved very helpful to the schools within the city.

**EDUCATION BY RADIO** During the year, there was a pronounced increase in the use of radio as an educational means. Dr. Walter Damosch conducted his second season of radio concerts for schools and colleges. The concerts which occurred each Friday from eleven to twelve were known as the N. B. C. Music Appreciation Hour. The National Broadcasting Company made use of its entire two networks covering some sixty stations. There were four series of concerts graded from the third grade through high school and college. Each series included twelve programmes. There was prepared a teacher's manual that might be used with these programmes. There were evidences that these concerts were received in large numbers at schools over the entire United States. In many cities, the entire school system was equipped with radio at public expense, in others, public spirited citizens provided funds with which to install radios.

The use of the radio was considered so important that Secretary of the Interior Ray Lyman Wilbur formed an advisory committee on education by radio. The committee was composed of representatives of various interests including several radio broadcasting companies. At a conference held in May at the office of the Secretary of the Interior, it was suggested that the four phases of radio that needed immediate close study were engineering techniques, organization and control, finance, and educational material for programmes. The radio companies indicated great interest.

They had on a number of occasions put their entire facilities at the disposal of those who were conducting educational campaigns.

The University of Southern California established a radio-correspondence educational division known as the Trojan Air College. The programmes, which were broadcasted, supplement the correspondence courses for which the University gives college credit. Those who were desir-

ous of credit could obtain mimeographed outlines to which the lecturers make references in their broadcasting.

**THE PAYNE FUND** The Payne Fund was organized in 1927 and was incorporated in 1929 under the laws of the State of New York. Its purposes are "to initiate, assist, or conduct researches, surveys, experiments, and other projects from which may be developed increased understanding of youth and its needs and capacities for constructive participation in society." The fund provided for the National Committee for the Study of Juvenile Reading, it assisted the National Committee for the Study of Social Values in Motion Pictures, it also established the Payne Fund Committee on Educational Research (in Motion Pictures), it financed the preliminary Committee on Educational Broadcasting and cooperated with the Ohio State Department of Education in organizing and maintaining the Ohio School of the Air. It financed a study of the biblio-psychology methods of Dr. Nicholas Rouhakine, and assisted and cooperated in a number of other social enterprises. The endowment of the Payne Fund was approximately \$2,000,000.

**THE PHELPS-STOKES FUND** This fund was incorporated in 1911. The act of incorporation directs the trustees to use the income for "the erection or improvement of tenement-house dwellings in New York City and for educational purposes for the education of Negroes both in Africa and the United States, North American Indians, and needy and deserving white students." The capital of the fund was approximately \$1,200,000.

**THE VISITING TEACHER** There were 230 visiting teachers in the city school systems of the United States. They were in 70 different cities scattered throughout 36 States. The function of the visiting teacher was set forth in a report of the director of visiting teachers of Dayton, Ohio, as follows:

To discover the cause of the child's failure to grasp the opportunity that benevolent school boards have planned.

To confer with the parents, enlisting their cooperation when the child shows signs of falling below the school's standards of scholarship or conduct.

To try to adjust many home conditions whereby more favorable conditions will be attained in regard to school work, conduct, attendance, and interest.

To interpret the school purposes and ideals to parents, thus securing a greater amount of much desired cooperation on the part of each toward the other.

To secure and record family history, personal history, and past and present performances of all children coming to her attention.

To aid in securing better school adjustment for all misfits in the broad interpretation of the word.

To secure personal and social information in regard to the child and bring it to the teacher and principal, so that it will make for better understanding of the child.

To try to find causes of unusual misconduct and endeavor to remedy the condition, either by influence with the child or the parents or both.

To cooperate with every outside agency to the highest degree, that all possible forces may be assembled toward individual and social betterment.

To analyze the child's social environment, home, and neighborhood.

**ADVISORY COMMITTEE ON EDUCATION** Secretary of the Interior Ray Lyman Wilbur with the approval of President Hoover formed an advisory committee on education for the purpose of making a study of the present relations of the National Government to education and to make recommendations as to what should be the future programme of the Government in that field. This marked the first comprehensive attempt that had been made to define the policy that should exist

between the Federal Government and education. The committee consisted of fifty-one members, the Chairman is Dr C. R. Mann, Director of the American Council of Education.

The committee was formed early in the year, but lack of funds prevented their undertaking the work. In November, the Julius Rosenwald Fund provided a donation of \$100,000 for the use of the committee. Dr. Henry Suzzalo was employed to direct the educational survey.

Three subcommittees were organized to consider the following problems (1) Educational activities of the U S Government and present administration, what should be the future organization (2) The subsidies of the Federal Government to colleges, their administration, results obtained, future policies. (3) Subsidies granted for education of less than college grade, how administered, results obtained, suggestions for future policy.

**ILLITERACY** In anticipation of the 1930 Census, there was a determined effort to reduce the amount of illiteracy in the United States. Secretary of the Interior Ray Lyman Wilbur with the approval of President Hoover announced the appointment of an advisory committee on national illiteracy. In announcing the formation of the committee and its aims, Secretary Wilbur said.

This matter of illiteracy is not very well understood. It is known vaguely that there are certain individuals here and there who do not know how to read and write. When young men drafted for service in the World War were examined, it was found that an unexpectedly large number of them were illiterate.

This was the first sweeping measure of illiteracy that had been applied. It indicated that illiteracy was, to a considerable extent, geographic. There were more illiterates in certain sections than in others. Isolation had a good deal to do with it. Certain individuals are beyond the reach of schools.

It will be important to determine how much illiteracy is due to a lack of opportunity. In many cases, also, illiteracy is due to personal causes. Certain physical or mental handicaps or poverty may prevent individuals from getting education.

The facts, aside from certain estimated numbers, however, have never been adequately gathered. The first purpose of the present study is to assemble those facts. When they were ascertained, the members of the committee will recommend those remedies and methods which seem most likely under existing conditions to reduce illiteracy to the minimum.

It is apparent that new agencies are becoming available that may be used in campaigns against illiteracy, but the methods and possibilities of their use are not understood.

Radio, for example, may reach isolated individuals and communities that are without schools. Another committee is studying the possibilities that lie in the use of radio for educational purposes.

The office of education has already arranged for certain educational courses by correspondence that will go to such isolated families as those of forest rangers or lighthouse keepers. These will also be made available to any isolated family. Talking motion pictures have possibilities. The study will include all available means of reaching those who are missing educational opportunities.

**ADULT EDUCATION** The movement toward adult education continued with increasing force. The U S Bureau of Education conducted a survey of the work undertaken in the different States. The results showed that there was legislation providing for the education of adult native illiterates in 25 States, while in addition 26 States had legislation pertaining to the education of foreign-born adults. The States reporting gave 2439 communities as holding classes for adults. The enrollment for the year ending June 30, 1928, was 262,308. This was an increase of approximately 58,000 over the preceding year. Some 34 institutions of higher learning reported that they were offering training for teachers of adults and six

States report that they have illiteracy commissions.

Entirely apart from the attempt to decrease illiteracy, there was great popular interest in the type of adult education that had for its purpose the further education of those who had entered upon their life work. There was marked progress in parent education. In many States provision was made for the instruction of parents in various phases of child study. It was reported that 47 colleges and universities offered such instruction in connection with their summer sessions. There are various extension divisions which offer courses for parents on subjects related to child welfare.

Programmes related to parent problems and child training have been broadcast. The Carnegie Corporation of New York has supplied the funds with which the American Association for Adult Education has made a six months' survey to determine the possibilities of radio broadcasting as a mechanism in adult education. See ADULT EDUCATION, AMERICAN ASSOCIATION FOR.

**NURSERY SCHOOLS** During recent years, much attention has been given to the care and education of children of pre-school age. For the year 1927-28, the U S Bureau of Education reported 121 nursery schools located in 70 cities. The total enrollment in 107 of the nursery schools was 2573 children. There was an average of nine children per teacher. The length of the school day was between six and eight hours and nearly all the schools operated for five days each week. The main service of the nursery school is the education of young children and their parents. The education of the parents is cared for in various ways. These include daily conferences with teachers, discussion and study groups, home visits by the school staff, and observation of and participation in the actual work of the children. In a few schools, the mothers and sometimes the fathers are required to give stated time to participation in the nursery-school programme. The nursery school has not been made a part of public-school education. There were a few demonstration schools in some of the larger public-school systems and teacher-training institutions.

Several of the larger universities, including the University of California, University of Iowa, Yale University, and Columbia University, had established and equipped nursery schools in which very careful experiments and investigations were under way.

**SURVEY OF SECONDARY EDUCATION** Congress authorized the U S Bureau of Education to make a study of the organization, administration, financing, and work of secondary schools and their articulation with elementary and higher education. There was an appropriation of \$225,000 of which \$50,000 is available for 1930. The Secretary of the Interior formed an advisory committee of 30 educators who were to aid in the nation-wide survey. He proposed to form a second committee consisting entirely of laymen. These two committees, one of trained educators and the other of laymen, were to pass upon the work of the commission viewing it both as educators and as average citizens.

**TEACHER TRAINING** The most important aspect of teacher training was to be found in the remarkable growth in the number of teachers' colleges. In 1920 there were but 46 teachers' colleges in the United States. By 1928 this number had increased to 137. Coincident with this in-

crease in the number of teachers' colleges, there was a decided decrease in the number of State, private, city, and county normal schools. It was estimated that approximately 975 colleges, junior colleges, and universities contributed to the training of teachers, supervisors, and administrators. There were also no less than 3000 high schools in which courses in education were offered.

The increase in the number of students who are prepared to teach also brings with it a serious problem in educational affairs. In 1920 the enrollment in teacher-training institutions was 194,534. In 1928 this had increased to 274,348. If the number of students registered in all teacher-training courses were included, the total for 1928 would be 512,247. It was estimated that there were approximately 900,000 teaching positions in the United States. It appears therefore that there were more than half enough students in training to fill all teaching positions.

In 1928 the teachers' colleges and normal schools certified or graduated 57,075 students having from one to four years of training. This does not represent a large percentage of the total teaching positions, but in various sections a serious over supply of teachers was reported. This difficulty was caused by the continued employment of those who had had no professional training but who had had experience in the schools. Were the positions occupied by those untrained teachers made vacant, there would be a serious lack of trained persons with which to fill them.

Many teacher-training institutions were limiting their enrollments, and some city institutions had been closed. Many States were making an effort to select their teachers from among the more capable applicants for entrance to teacher-training institutions. For the purpose of making such selections, fully one-third of the teachers' colleges and normal schools were making use of intelligence tests and refused admission to those who stood low. About half of the institutions required certificates of health and a few require superior scholarship records in high school.

The expenditures for teacher training in 1928 amounted to \$64,349,498. The per-capita cost varied somewhat with the size of the institution. It was reported as \$205.47 in certain State normal schools having between 800 and 1000 students, while 16 teachers' colleges having an enrollment of fewer than 400 students had an average per-capita cost of \$439.67 for current expenses.

**STATISTICS.** No comprehensive statistics on enrollment in elementary schools of the United States have been issued by the U. S. Bureau of Education later than those in the 1928 YEAR BOOK.

See **UNIVERSITIES AND COLLEGES**, also paragraphs on *Education* in articles on various States and countries.

**EDWARDS, ALBERT.** See **BULLARD, ARTHUR EGGS.** See **LIVESTOCK.**

**EGYPT.** A kingdom in northeastern Africa, governed by the King since Mar. 15, 1922, after the termination of the British protectorate declared Dec. 18, 1914, occupying the Valley of the Nile, the Libyan Desert, the region between the Nile and the Red Sea, and the Sinai Peninsula, claiming jurisdiction also over the Sudan, which claim, however, is denied by the British. Capital, Cairo. Ruler in 1929, Fuad I.

**AREA AND POPULATION.** The total area of Egypt proper which is described above is about 383,-

000 square miles. This figure does not include the Sudan. The cultivated and settled area, comprising the Nile Valley and Delta and the oases is only 13,600 square miles. The last census of the settled area, taken on Feb. 18-19, 1927, gave the total population at 14,186,898, including 34,402 nomads, as compared with 12,760,918 at the census of March, 1917. It was estimated in 1929 that the cultivated area of Egypt is the most densely populated in the world, containing an average of three persons to an acre. Most of the inhabitants live at an expense of less than 10 cents each per day. The chief cities with their populations at the census of 1927 were: Cairo, 1,064,567; Alexandria, 573,063; Port Said (including Ismailia), 104,603; Suez, 35,547; Tanta, 90,014; Mansura, 63,676; Asyut, 57,131; Dammanhur, 61,720; Faiyum, 52,372. In 1917 the population was distributed among the various religious as follows: Mohammedans, 11,658,148; Greek Orthodox, 854,778; Roman Catholic, 107,687; Jews, 59,581; Protestants, 47,481. The movement of population in 1927 was: Births registered, 627,583; deaths, 359,455.

**EDUCATION.** Primary instruction is supplied by native schools called *maktabs*. In the school year 1927-28 the number of these receiving grants-in-aid and under government inspection was 2,361, with 205,900 pupils and 50,439 teachers, while those under the immediate direction of the government was 389, with a total attendance of 62,423. In addition, there are higher elementary and higher primary schools, a few schools for special and technical training, and higher colleges of law, engineering, military science, veterinary science, agriculture, pedagogy, commerce and accounting, and medicine. The total population of school age, 5 to 19 years, in 1927 was 4,734,071 and the number attending school during 1927-28 was 841,711. About 88 per cent of the population is illiterate. The centre of Moslem culture is the mosque and university of El-Azhar at Cairo, founded in 972. In 1929 the university was reorganized and a modern curriculum established.

**PRODUCTION.** Cotton prices continued to improve during 1928 and the agricultural and economic condition of the country showed further recovery from the depression of 1926. The cotton crop for the year was estimated at 1,491,000 bales (averaging 478 pounds net), an increase of about 19 per cent over the previous year. The higher price was reflected in a large increase in cotton export values. The onion crop was good, the grain crops smaller, and sugar output about the same as in the previous year. The acreage and production of the principal crops in 1928 was as follows: Wheat, 1,590,000 acres, 37,296,000 bushels; barley, 366,000 and 10,799,000; rice, 215,000 (other figure not available); beans, 531,000 and 10,922,000; onions, 54,000 acres, 756,320,000 pounds; sugar cane, 59,000 acres, 1,544,000 metric tons (reduced to 80,000 metric tons of raw sugar); cotton, 1,805,000 acres, 712,698,000 pounds.

Crop diversification has been stimulated by the restriction of the area sown to cotton to one-third the original acreage. The extension of irrigation projects upon which Egypt is so dependent proceeded rapidly in 1929. A barrage at Nag Hammadi, which will provide perennial irrigation for 500,000 acres along the Nile, will be completed in 1930. Other plans call for the heightening of the Assuan Dam and the reclamation of about

1,500,000 acres of salt-laden coastal waste land along the Nile delta. In 1928 there were in Egypt 792,000 cattle, 788,000 buffaloes, 1,200,000 sheep, 15,000 swine, 648,000 goats, 180,000 camels, and 762,000 asses. Chief mineral products were petroleum, 1,972,000 barrels, manganese ore, 200,563 metric tons, phosphate rock, 137,502 metric tons.

**COMMERCE** Egypt had a favorable balance of trade in 1928 for the first time in three years, the surplus of exports over imports amounting to £E4,121,000 (\$20,571,000), as compared with an adverse balance of £E345,000 (\$1,720,000) in 1927. The improvement was chiefly due to an increase of 16 per cent in the value of cotton exports. Total exports were £280,338,000, as compared with \$241,011,000 in 1927, and total imports, £269,767,000, as compared with \$242,733,000 in 1927. Besides cotton, the other principal exports were onions, cottonseed cake, cottonseed, gold bullion, and silver bullion. The chief imports were fertilizers, tea, wool textiles, sugar, tobacco leaf, engines, and kerosene, for all of which larger quantities were required than in the previous year, and also cotton piece goods, coal, soap, and railway trucks, the demand for which declined in 1928. The United Kingdom took 38 per cent of the total exports and supplied about 22 per cent of the imports in 1928. Exports to the United States amounted to \$30,541,000, a decrease of 10 per cent, while imports from that country were valued at \$13,416,000, an increase of about 18 per cent. France, Italy, and Germany were other leading countries in Egyptian trade.

According to preliminary figures, Egyptian foreign trade in 1929 resulted in an adverse balance of £E4,337,500 (about \$21,687,500). Imports totaled £E56,089,500 (\$280,447,500) and exports, £E51,752,000 (\$258,760,000).

**FINANCE** Government finances, which have been in a favorable condition for several years, showed further improvement in 1928. The reserve fund which had been built up largely through the failure to utilize appropriations for public works, increased from £E35,000,000, at the end of 1927, to £140,000,000, at the close of 1928. The actual receipts in the budget year ending Apr. 30, 1928, were £E38,566,805 and expenditures were £E35,389,036, leaving a surplus of £E4,263,880. The estimates for the year anticipated receipts of £E36,277,000 and expenditures of £E38,919,000. The budget for 1928-29 estimated receipts at £E37,532,000 and expenditures at £E41,532,000, while that for 1929-30 placed receipts at £E38,950,000 and expenditures at £E47,410,000, or a deficit of £E8,460,000, which is expected to be met from the reserve fund. The latter budget contains an item of £E11,000,000 for new public works, chiefly irrigation. In April, 1928, the total public debt was £100,730,610. The service on the debt was estimated at £E4,785,789 in the budget for 1928-29. Early in 1929 a financial agreement between Great Britain and Egypt was ratified, providing for the settlement of outstanding financial questions and in particular determining Egypt's liability for the Ottoman Guaranteed Loan of 1855. The Egyptian government agreed to pay the arrears of the Egyptian contribution to the service of the loan which had been withheld since 1924.

**COMMUNICATIONS** In 1927 there were 2272 miles of railway owned by Egypt and 854 miles by private enterprise. Operating expenses of the state railways in 1927-28 were £E4,672,138, or 66 per cent of the gross receipts of £E7,118,272.

The length of telegraph and telephone lines in 1928 was 169,204 miles. The telephone system is government owned. Air lines connect Cairo with Mesopotamia and Palestine. During 1928, 2173 steamships of 4,965,800 registered tons entered Alexandria, as compared with 2132 vessels of 4,880,700 tons in 1927. Vessels passing through the Suez Canal in 1928 numbered 5977 of 31,615,800 registered tons, in 1927, 5422 vessels of 28,525,500 tons.

**GOVERNMENT** According to the constitution promulgated Apr. 19, 1923, Egypt was proclaimed a sovereign state under a hereditary monarch, with representative government. Equal rights, irrespective of race, language, or religion, were guaranteed, as was the liberty of the individual and religious belief. Executive power is vested in the King, who also exercises legislative power in concurrence with the Legislature. The latter consists of the Senate and Chamber of Deputies, the Senate to be composed of three-fifths elected by universal suffrage and two-fifths (including the President) appointed by the King (the term of office is 10 years, one-half is renewed every five years), and the Chamber of Deputies consists of members elected by universal suffrage for a period of five years. The King can dissolve the Chamber of Deputies to which the cabinet is individually and collectively responsible. Mohammedanism is the state religion and Arabic the official language. King in 1929, Fuad I, who acceded to the throne Mar. 15, 1922.

**HISTORY.** The deadlock between the British Conservative government and the Egyptian Nationalists which followed the rejection of Foreign Secretary Austen Chamberlain's proposed treaty of 1927 (see 1928 NEW INTERNATIONAL YEAR BOOK) was broken during 1929 by the advent of the Labor government in Great Britain. The Labor Foreign Secretary, Arthur Henderson, made new proposals for a settlement of outstanding difficulties which were approved by Mohammed Mahmud Pasha, the Egyptian Premier, during the latter's visit to England in the summer, and made public in the form of a draft treaty on August 6. The treaty, if ratified, will terminate the British military occupation effective since 1922, establish a close military alliance between the two nations, and place in the hands of the Egyptian government responsibility for the lives and property of foreigners in Egypt. It authorizes Great Britain to maintain troops on Egyptian territory bordering the Suez Canal for the protection of that vital artery of Empire trade, pledges British support in behalf of the abolition of the capitulatory régime in Egypt, and defines the status of the Anglo-Egyptian Sudan as that established by the Convention of 1899.

A promise to consider the proposal for the return to the Egyptian army of a British battalion is made by the British on condition other provisions of the treaty are observed in Egypt in the same friendly spirit in which the treaty was negotiated. By other terms in the proposed treaty, Great Britain undertakes to support Egypt's application for admission to the League of Nations, the two countries agree, in the event of a critical dispute with a third state, "to concert with a view to its peaceful settlement"; and each country undertakes not to violate the friendly spirit of the alliance in its dealings with other nations, nor to conclude with a third Power an agreement prejudicial to the interests of the other.

It is further provided that Egypt shall select any foreign military instructors required from among British subjects, and when engaging the services of other foreign officials "will, as a rule, engage British subjects", that Great Britain will be represented in Egypt by an Ambassador, who will have the highest diplomatic rank at the court of the King of Egypt; and, finally, that modifications of the treaty may be made by agreement between the two governments after the treaty has been in force 25 years. To become effective, it is stipulated that the treaty must be ratified by a freely elected Egyptian Parliament and by the British Parliament. In Egypt, the terms of the treaty appeared to be favorably received, but the internal political situation was such that it was impossible to predict what would happen when it came before Parliament. The Liberals, whose leader, Mohammed Mahmud Pasha, negotiated the treaty, and the Ittihad party declared unhesitatingly for its acceptance, but the powerful Wafd, or Nationalist party, which had a considerable majority when Parliament was dissolved in 1928, refused to allow the treaty to be made the issue of the Parliamentary elections and announced that it would not express an opinion upon it "except under the dome of the Chamber of Deputies."

While criticized by the Conservative press in Great Britain, Australia, and South Africa on the ground that it failed to properly safeguard British interests, the treaty appeared likely to receive the approval of the British Parliament. Lord Lloyd, who on July 24 had been forced to resign as British High Commissioner in Egypt under pressure by Foreign Minister Henderson, attacked the treaty in the House of Lords December 11. He said it committed British and other foreign interests in Egypt to an immature political system and that the proposed return of Egyptian troops to the Sudan would "undo all the magnificent work Great Britain has done in that territory." Sir Austen Chamberlain, on the other hand, indicated that he would support the treaty, which he said followed closely the terms of the treaty he negotiated with Sarwat Pasha, which was rejected by Egyptian extremists. The most important difference between the draft treaties of 1927 and 1929 is that the former did not provide for the immediate termination of military occupation but simply indicated that the location of British troops maintained in Egypt was to be decided "after a period of 10 years."

Mohammed Mahmud Pasha who had served as Prime Minister since June 25, 1928, and governed without Parliament after July 19, 1928, resigned on Oct. 2, 1929, thus paving the way for the resumption of constitutional government. Adly Pasha Yeghen was asked by King Fuad to assume the office temporarily, pending the holding of elections and on October 31 the King issued a decree restoring the constitution. The meeting of the new Parliament was set for Jan. 11, 1930. Members of Adly Pasha Yeghen's cabinet were Midhat Pasha Yeghen, Foreign Affairs, Ahmed Pasha Aly, Religious Endowments, Hussein Pasha Darwish, Justice, Abdel Rahim Pasha Sabry, Communications, Mustapha Pasha Mahel, Finance, Hussein Pasha Massif, Public Works, Wassef Pasha Semeika, Agriculture, Hafez Pasha Hussein, Education, Mohammed Aflatoun Pasha, War. The election of December 21 resulted in an overwhelming victory for the Nationalist, or Wafd party, which in the new

Parliament held 206 of the 232 seats. Nineteen of the non-Wafd seats were filled by Independents allied with the Nationalists. Adly Pasha Yeghen's cabinet resigned on December 31 and King Fuad announced that he would summon Mustapha Pasha Nahas, the Nationalist leader, to form a cabinet.

Another important event connected with Mohammed Mahmud Pasha's brief dictatorship was the conclusion in 1929 of an agreement with Great Britain regarding the distribution and control of the Nile waters. The agreement was reported to make the previous consent of the Egyptian government a condition of the construction of all future irrigation works situated in the Sudan or other British Nile territories, in case such projects should impair the interests of Egypt. With this difficult problem settled, the Egyptian government prepared to proceed with the construction of the great dam at Gebel Aulia, on the White Nile, 30 miles south of Khartum. The dam will nearly double the quantity of water available for distribution from the Assuan Dam. On Nov. 12, 1929, the Egyptian government notified all countries concerned that a new customs tariff would come into force on Feb. 16, 1930. The tariff is based on the recommendations of an international commission of tariff experts, and is expected to impose higher protective duties on certain articles manufactured in Egypt. King Fuad made a tour of Germany, Czechoslovakia, Switzerland, France, and England during the summer of 1929.

**EGYPTIAN ARCHAEOLOGY.** See ARCHAEOLOGY.

**EINSTEIN THEORY.** See PHYSICS.

**ELECTRICAL ENGINEERS, AMERICAN INSTITUTE OF.** A national organization representing the electrical engineering profession, founded in 1884. The objects of the institute are the advancement of the theory and practice of electrical engineering and of the allied arts and sciences, the maintenance of a high professional standing among its members, and the development of the individual engineer. It is governed by a board of directors, elected by the membership, consisting of a president, the 2 junior past presidents, 10 vice presidents, 12 directors, and a treasurer. In 1929 there were 57 sections of the institute located in various cities throughout the United States and 104 branches in colleges giving courses in electrical engineering. Three annual conventions are held, in addition to regional, local section, and branch meetings. Much of the institute's work is accomplished through its standing and technical committees, of which there were 37 in 1929. It maintains, in cooperation with other national engineering societies, the engineering societies' library and a national employment service. There are three grades of members as follows: Associate, member, and fellow. The total membership on Oct. 1, 1929, was 18,329.

The principal publications of the institute are the monthly *Journal*, the quarterly *Transactions*, the *Standards of the A.I.E.E.*, and the *Year Book*. The officers elected for 1929-30 were: President, H. B. Smith; junior past presidents, Bancroft Gherardi and R. F. Schuchardt; vice presidents, E. B. Merriam, H. A. Kidder, W. T. Ryan, B. D. Hull, G. E. Quinan, H. S. Evans, W. S. Redman, C. E. Fleeger, E. C. Stone, and C. E. Sisson; directors, I. E. Moulthrop, H. D. Don Carlos, F. J. Chesterman, F. C. Hanker, E. B. Meyer, H. F. Liversidge, J. A. Johnson, A. M. MacCurt-

cheon, A. E. Bettis, W. S. Lee, J. E. Kearns, and C. E. Stephens; national treasurer, George A. Hamilton, national secretary, F. L. Hutchinson. The institute's national headquarters are in the Engineering Societies Building, 33 West 38th Street, New York City, of which it is joint owner and occupant with three other national engineering societies.

**ELECTRICAL INDUSTRIES.** The application of electric motors to industry has been characterized by a very great increase in the quantity and the variety of methods of mechanical handling of materials in place of manual labor. Within the past year, the electric motor has, in many new installations and replacements of old, taken over the hard labor of man and relieved him of the arduous work of his hands to be free to use his head instead. The central stations of the United States gave an output of 92,737,000-000 kw-hrs in the year 1929, an increase of 12 per cent over the preceding year. The gross revenue from this was \$2,107,000,000, making an average of 2.23 cents received per kw-hr. 64 per cent of this energy was produced from fuels and 36 per cent from water power. The average coal used per kw-hr was 1.6 lbs., as compared to 1.7 the year before.

The steel mills again showed the most notable increase in the use of electric motors, over 200-000 horse power of new motors was installed in these mills in one year. In the important work of the rolling mills, 80 per cent of the motors are of the direct-current type supplied by a motor-generator set by means of Ward-Leonard control, the motor of the set being driven by alternating currents from a large supply system, either local to the plant or from a public utility. The largest direct-current motors in existence were to be found in the steel mills, an example being the installation of the Illinois Steel Company with a 7000-horse-power direct-current motor operating at from 50 to 120 revolutions per minute at 750 volts from a motor-generator set with a fly-wheel.

On the other hand, there were certain constant speed mills which are now operated by synchronous, alternating-current motors, for example, a 5000-horse-power 82-revolutions-per-minute synchronous motor of the Columbia Steel Company in California. The advantages of this type of motor are its higher efficiency, higher power factor, and lesser cost. The disadvantages are its lesser adaptability to frequent starting and impossibility of changes of speed.

The New York Central Railroad installed a car dumper which would unload one car each minute by turning it upside down, which requires an aggregate of 3000 horse power. The mining industry continued to improve its methods by the installation of electric hoists because of their high speed and labor-saving qualities. One hoist in a coal mine makes 230 trips per hour to a depth of 282 feet and involves a rope speed of 3300 feet per minute. Another hoist in a copper mine is of the two-skip balanced type, taking 12 tons each from a depth of 835 feet at a speed of 900 feet per minute, and is operated by a push button like an automatic electric elevator. The record for size of electric shovels again was broken by the construction by the General Electric Company of a shovel of 1800-ton weight taking 20 cubic feet at a stroke on a 120-foot boom. The aggregate energy of all its motors was 4000 horse power and it could dig and dump a

shovel-ful in less than one minute. It was built on caterpillar tractors and is self-propelled.

Among small motors, the increasing use of capacitor motors was noteworthy. These are alternating-current motors which will operate from single-phase mains and yet have a good starting torque and high-power factor. The best-known application is in electric refrigeration, but they are very generally applied in industry in sizes up to 5 horse power. Another improvement is a new type of induction motor which, in sizes up to 30 horse power, may be started by simply closing a switch without the use of a starting device. An interesting novelty brought out by the Westinghouse Company was "the motor that tries and tries again." It is a small motor for household uses (such as washing-machines), which has an ingenious friction clutch between the motor and the load. If the load becomes too great, the clutch slips, lets go the load, and then springs back at it again giving a jerk with momentum which tends to overcome the sticking.

Electric welding continued to claim a larger field. Naturally, it thrives best in its home, so we find that a greater percentage of electric machinery is of the welded or fabricated construction instead of castings. A pipe line 90 miles long and 66 inches in diameter was constructed by welding rolled-steel plates at a cost less than that for riveting. Sets for supplying the current for welding are now completely built on small self-propelled trucks. A number of cities revised their building codes to permit electric welding of steel structures instead of riveting. The new Ford car uses electric welding to such an extent that its design was adapted to make the most of the economies and convenience of electric welding.

There was a considerable development in electric heaters, ovens, and furnaces. The automobile industry adopted electric ovens for much of its work and also the making of malleable iron had been improved because of the ease and exactness of control of the electric heat. A new electric furnace was developed in the form of a cap or bell which contains the resistance heating units and which may be lowered on to various bases on which material to be heated has been piled. By the use of several bases for one furnace bell, the active part is working on one charge while others are being prepared or are being cooled after the operation.

Among the interesting small devices was a 10,000-volt direct-current generator for the plate current of tubes for radio transmitting and a smoke recorder which consists of a beam of light thrown across the interior of a chimney onto a photoelectric cell. As smoke passes, it obscures the beam of light and affects the current given by the photoelectric cell. The decrease in current is proportional to the opacity of the smoke column.

#### **ELECTRICITY SEE PHYSICS ELECTRIC LIGHT ANNIVERSARY. See CELEBRATIONS**

**ELECTRIC LIGHTING.** In 1929 there were sold 340,000,000 large-sized incandescent lamps and 292,000,000 miniature lamps, an increase of 6 and 21 per cent, respectively. Simplification and standardization of sizes has continued and the 60-watt lamp was made in the same bulb as the 50- and 40-watt sizes and the basic price reduced to the standard 20 cents. Production managers of industries are finding it safe and profitable to increase the general illumination of their factories

up to 15- to 30-foot candle intensity, with 40- to 60-foot candles in special locations. It is interesting to compare these values with the 5- to 8-foot candle intensity which was considered good illumination 10 years ago.

For health and general therapeutical purposes, there was put on the market a so-called "sun lamp" which consists of a bulb of standard size and shape inside which there is a coiled tungsten filament, and an arc between tungsten electrodes in an atmosphere of mercury vapor. This combination gives a light rich in the active rays in the blue-violet spectrum. The glass of the bulb is of special composition known as "Corex" which strains out the excess of dangerous ultra-violet rays and transmits a light which is claimed to be the same as sunlight in summer time. The complete outfit (a transformer and regulator are required) is fitted up as a household device that may be plugged into any alternating-current supply socket so that the health-giving effects of sunlight may be had in the home without the dangers involved in the use of the excessively active rays from either the mercury or the iron arc.

The fiftieth anniversary of Edison's development of the incandescent lamp was celebrated as "Light's Golden Jubilee" in 1929. There were many expositions and display effects by lighting companies, municipalities, and private individuals. The Westinghouse Company took this occasion to establish a "Lighting Institute" in the Grand Central Palace in New York City. This was intended to give the general public a chance to see examples of good illumination and the latest improvements in the art. This, like similar institutions of the General Electric Company, Harrison, N. J., and Cleveland, Ohio, is a permanent exhibit where anyone interested may see what is considered latest and best in electrical illumination.

The trend toward modernistic art in lighting fixtures continued and increased, particularly in new residences and the entrances and foyers of office buildings and hotels, while the simple and practical seems more popular in the offices themselves. Increase in quantity of light and improvement in artistic effects were the characteristics of street lighting in 1929. Woodward Ave., Detroit, is an outstanding example having ornate standards placed 100 feet apart on both sides of the street with two 2000-watt lamps on each standard. This gives 1900 lumens per linear foot of street. New devices for airports, particularly boundary lights and course beacons, were developed for aviation for the purpose of making night flying safer.

Flood-lighting has been used to make possible outdoor recreation and sports at night. Several stadiums and football fields were equipped and games were played at night with thousands of satisfied spectators and tennis courts were lighted from above with an illumination intensity of from 30- to 50-foot candles, under which condition it was found that the game could be played and seen comfortably. In the moving-picture industry, there has been a trend to the use of large-sized incandescent lamps, 1000 to 5000 watts, in place of the mercury light. This gives a better and more convenient arrangement, as the incandescent lamp is smaller and more adaptable. In making one well-known picture, 3,900,000 watts in incandescent lamps were used. In certain cases, to avoid danger of fire, these lamps are water-cooled.

Much difficulty has been experienced from the glare of automobile headlights. It was found that in most cases the objectionable glare was caused by the car owners themselves in replacing burned-out lamps, since they were not competent to place the new lamp at the exact focal point of the reflectors. With the older types of lamps, this was a matter of nice adjustment. To overcome this, the manufacturer of the headlights and of the lamps have cooperated in the production of the fixed-focus headlight, in which it is impossible to put the lamp in a wrong position.

**ELECTRIC POWER TRANSMISSION AND DISTRIBUTION.** Protection from interruption by lightning continued to be the principal item of interest in long-distance transmission. New instruments for studying the effects of lightning have been devised, old ones improved, and an intensive campaign of study in the field has been carried on. The most notable improvement was the Norinder cathode-ray oscillograph in which the lightning stroke itself is utilized to set the instrument in operation to obtain a record. Formerly, it was necessary to have attendants present to start the oscillograph operating when a lightning stroke was expected, and to wait some minutes for the stroke, during which time the photographic film was being fogged by uninvited phenomena. Now the instrument may be left set and only requires the attention of replacing the exposed film by a fresh one. Surge-voltage recorders, lightning-stroke recorders, and cloud-intensity meters have been added to the equipment. Lighting generators capable of giving an impulse of 1,000,000 volts have been developed so that they can be carried around on automobile trucks, thus making it possible to produce lightning at will, where and when it is wanted.

A prize was given by the American Institute of Electrical Engineers for a paper which discussed this subject and proposed a careful rational design of the insulation of a system and so proportioning the insulation of the various parts that the least important or least vital parts have the weakest insulation and therefore be the first to give way. Such a part would be the transmission line and that part of it near the power station where repairs could be made the most readily.

It has been found that natural lightning flashes cause a rise in voltage in a transmission line to somewhere between one and two million volts in a period of time of about five-millionths of a second. A new type of lightning arrester was brought out known as the "porous disc arrester." This arrester is similar to the "autovolt arrester" but each disc is one inch thick. One disc will do for a 2300-volt line, yet it will discharge 1000 amperes when a stroke comes. This improvement will decrease the size of the lightning arrester to about one-half.

An oil-filled type of circuit breaker was developed capable of interrupting a 220,000-volt circuit with 3,000,000 kva. of power in it.

A new circuit breaker, known as the "De-ion" breaker was brought out which does not require oil to suppress the arc which always forms when any switch opens. This type operates by forcing the arc, by means of a magnetic field, into a special chamber where the arc is broken up into many short arcs in series, on the principle of the multigap lightning arrester. These small arcs die out very rapidly.

The use of underground cables for high-voltage

transmission at 44,000, 66,000, and 132,000 volts continued to grow. Improvements were made in the method of keeping the cable and joints filled with oil under pressure, as the secret of the success is to keep out all air and water. In 1929 there were in commercial operation 193 miles of 66,000-volt underground cable and 53 miles of 132,000-volt cable.

There was a distinct trend among the public utilities to go to the higher voltages for their transmission systems, thus changing from 33,000 or 44,000 to 66,000 or 132,000, but there has been no attempt to go higher than 220,000 volts in this country.

**DISTRIBUTION** In distribution, the three-phase, four-wire system during the year 1929 continued to displace the two-phase and the old direct-current systems. The direct-current system usually was left to supply industrial plants which find that direct-current motors are more adaptable to their kind of work, but residences, apartments, and hotels were gradually changing over to alternating-current service. This service had become as reliable and steady as the direct-current service because of the many improvements such as network protectors, tap-changing transformers, and improvements in transformers in general.

**ELECTRIC RAILWAYS** For a good many years, the electric railways of the United States had been having a difficult time due to the competition of jitneys, busses, and automobiles in general, but in the year 1929, these electric railways earned the largest net revenue in their history \$83,000,000. This was earned out of a gross income of \$1,130,000,000, resulting from carrying 16,000,000,000 passengers and performing 2,400,000,000 car miles. It will be noted that this is an average income of 7.1 cents per passenger or 0.47 cent per car mile.

Among the steam railway electrification projects, that of the Pennsylvania R. R. ranks first. This road had established electric suburban service from Philadelphia to Wilmington, Del. and to West Chester, Pa., and was at work on providing for through passenger and freight service from New York to Wilmington, Del. The New York Central was at work on the electrification of the West Side freight branch from Spuyten Duyvil to Canal Street in New York City. The upper part, used on private right of way, was to be equipped for operation from trolley or third rail, but from Sixtieth Street south, there would be employed locomotives equipped with a Diesel-electric prime mover, storage batteries, and the usual traction motors. The Delaware, Lackawanna & Western decided on the use of mercury rectifiers exclusively for the conversion of the purchased alternating-current to the 3000-volt direct-current power used by the trains.

The use of Diesel-electric locomotives was increasing. The usual type had 300 horse power in its prime mover. Some were built having two of these 300-horse power sets on one locomotive of 108 tons. More recently (for the N. Y. Central), a locomotive was developed having a 12-cylinder engine arranged as a twin six in a V-shape and giving 900 horse power.

Gasoline and the lighter distillates had been almost exclusively used on the "gas-electric cars" in the past, but these cars were being built to use heavier oils in Diesel-electric prime movers. The Canadian Pacific Railway has 14 of such cars.

In an endeavor to save the life of the electric street railways, a new type of car has been

brought out. It is a light-weight car (13 tons), constructed partly of aluminum alloys, seats 42 people, and has four 50-horse-power motors of a new type, weighing only 850 pounds each. It has the new automatic control which permits an acceleration of 5 miles per hour per second without discomfort because the rate of change of

constant by automatic means. The braking is done at the same high rate by using the electric motors, automatically controlled, as generators. This value of acceleration and about double that used on the New York

The steam railways of the country were gradually adopting the control of the operation of their trains by the automatic electric system in which electric circuits in the track communicate signals to the locomotive which give first a warning by light and bell, and then, if the speed is not moderated, the control will apply the brakes and stop the train. Thus even fog or carelessness will not allow the engineer to pass a danger signal. There were about 15,000 miles of track and 9000 locomotives equipped in this way and the principal lines, particularly between New York and Chicago, were using this fact as an argument to attract passenger traffic.

**ELECTRIC TRANSPORTATION, MARINE** In marine transportation, the addition of the new S. S. *Pennsylvania* to the New York-San Francisco service gave three large turbo-electric vessels on this route. The *Pennsylvania* was similar to the *California* and *Virginia* which had been in service a couple of years and have been described before. Five similar vessels were being built for the Grace Line, the Ward Line and the Dollar Line. A novelty in water transportation by electric motors is the caterpillar tractor tugboat for hauling barges in the shallow rivers of the Middle West and South. Its motive power consists of two long chains of large buckets operating similar to the drive of the caterpillar tanks of war fame. These chains of paddles extend from bow to stern underneath the flat bottom of the boat and return through the hull. Each is driven by an electric motor which receives its current from a 200-horse-power Diesel-electric set. It is steered by varying the relative speeds of the two bucket chains and may be tuned in its own length. See SHIPBUILDING, SHIPPING.

**EMORY UNIVERSITY.** A coeducational institution for higher learning in Atlanta, Ga., founded in 1836. The enrollment for the autumn

of 1929 was 1130, distributed as follows: College of arts and sciences, 509; school of business administration, 115; graduate school, 46; school of theology, 49; law school, 58; medical school, 196; library school, 40; junior college at Oxford, 59; junior college at Valdosta, 67. The enrollment for the 1929 summer session was 814. The faculty numbered 250, 95 of whom were full-time members. The endowment amounted to \$3,763,088, and the income for the year was \$761,092. On the death of Ara G. Candler, Sr., the \$2,000,000 annuity which he had set aside for the university became available for endowment. There were 100,000 volumes in the library. In 1929 the college of arts and sciences was divided into a junior college and a senior college, and a second junior college was established in Oxford. The Florence Harris Home for Nurses also was completed. President, Harvey W. Cox, Ph.D., LL.D.

**ENGLAND.** The term in its strictest sense applies to the largest and most densely populated part of the Island of Great Britain. As employed in reference to the Government, it often indicates the United Kingdom and Ireland. See GREAT BRITAIN.

**ENGLAND, CHURCH OF THE.** The Established Church of England. Its faith is represented in the United States by the Protestant Episcopal Church (q.v.). The King is the supreme governor of the Church, possessing the right to nominate to vacant archbishoprics and bishoprics. The King and the First Lord of the Treasury also appoint to certain deaneries, prebendaries, and canonicies, and the Lord High Chancellor to certain canonicies. For administrative purposes, the country is divided into two provinces. The Convocation of Canterbury and the Convocation of York, each under the control of an archbishop. The church assembly, established in 1920 "to deliberate on all matters concerning the Church of England and to make provisions in respect thereof," consists of three houses, composed of bishops, clergy, and laity, respectively, the laity being elected every five years by the lay members of the diocesan conferences, which consist of representatives elected by members of the church. Every measure passed by the church assembly must be submitted to an ecclesiastical committee, consisting of 15 members of the House of Lords and 15 members of the House of Commons. This committee reports on each measure to Parliament, and the measure becomes a law if it is passed by both Houses of Parliament. Parochial affairs are managed by parochial church meetings of parishioners and by church councils elected by such meetings. In 1927 the number of qualified electors on the electoral roll was 3,636,422, of Easter communicants, 2,528,393, of baptisms, 443,681; of incumbents, 12,890, of

dioceses, 43; of clergymen, between 16,000 and 17,000, of Sunday-school pupils, 1,841,359. Voluntary parochial contributions received during the year amounted to £7,113,844, total contributions from all sources were £9,910,683.

The events of 1927 and 1928 largely influenced the affairs of the church during 1929, and the bishops had to face many difficulties in dealing with the administrative problems arising from the rejection by the House of Commons in December, 1927, and June, 1928, of the Prayer Book Measures which had been approved by large majorities in all three houses of the church assembly. Recognizing that it was "impossible and undesirable to bring back the conduct of public worship strictly within the limits of the Prayer Book of 1662," they acted on principles which were embodied in a resolution endorsed by both houses of the two convocations in July, 1929, and which regarded the Book of 1928 as the standard of permissible deviation from the Prayer Book of 1662 "during the present emergency and until further order be taken."

The question of the reunion of Christendom caused much discussion during the year, mainly as a result of the proposed union of churches in South India. The movement for some such union had been in progress for more than 10 years. In 1929 a proposed scheme of union was sent to the governing bodies of the churches concerned.

The Church of India, Burma, and Ceylon, the South India United Church, and the South India Provincial Synod of the Wesleyan Methodist Church. The scheme met with both support and great objection, the latter being based mainly on the proposals to use clergy who for a time would not necessarily be episcopally ordained. Steady progress also was made during the year with the reparation of St. Paul's Cathedral in London. It was hoped that the whole of the cathedral would be ready for divine worship by June 25, 1930, the date fixed for the reopening service.

The four measures which completed their passage through the church assembly and ultimately received the royal assent during 1929 were: The parochial registers and records measure, the representation of the laity measure, the ecclesiastical dilapidations (amendment) measure, and the Westminster Abbey measure. The parochial registers and records measure makes provision for the better care, in certain cases, of parish registers and other records in ecclesiastical custody. The representation of the laity measure affects every parish in England, as it repeals the rules for the representation of the laity, which had been in force since 1922, and substitutes therefor a new set of rules which, while not differing in any very important particulars from the old rules, regulate a number of points for which these latter made no provision. The ecclesiastical dilapidations (amendment) measure is concerned mainly with matters of administrative detail and renders easier the working of the ecclesiastical dilapidations measure of 1923. The Westminster Abbey measure provides for the reapportionment of the annual income of the Dean and Chapter of Westminster.

Other proposals considered by the church assembly during the year included two ecclesiastical commissioners measures, the archdeaconry of Surrey measure, the pluralities measure, and the ecclesiastical commissioners measures extend

the powers of the commissioners, one enabling them to grant pensions to the two paid church estates commissioners and the other empowering them to make grants for work in the Isle of Man. The archdeaconry of Surrey measure was necessitated by the financial adjustments consequent upon the formation of the dioceses of Guildford and Portsmouth. The object of the marriage measure is to make it possible for marriages to be solemnized in any church which is the usual place of worship of the persons to be married or of either of them. The pluralities measure extends the scope of the union of benefices measure, 1923, so as to permit of commissioners under the measure recommending that any two or more benefices may be held in plurality. The parsonages measure consolidates and amends the law relating to the sale, purchase, and improvement of parsonage houses.

The usual meetings of the Convocations of Canterbury and York were held in February and July, the latter being the first meetings of the eighth convocation of the present reign. Considerable changes in the membership of the lower houses were made by the provincial elections which followed the dissolution. The Archdeacon of St Albans was elected prolocutor of the lower house of the Convocation of Canterbury, and the Archdeacon of Halifax, prolocutor of that of York. The Prayer Book the date of Easter the order of deaconesses and the distribution of man power in the church were among the subjects which engaged attention. Other gatherings included the Salisbury Clerical Conference which was held in Westminster in January and the Cheltenham Evangelical Conference which met in Oxford in April, the general subject for discussion being "Lambeth and Reunion." The Anglo-Catholic Congress anniversary meetings were held on July 5, when "Christian Internationalism" was considered. At the Conference of Modern Churchmen, held in Cambridge September 23-30, the prescribed subject was "Spiritual Authority in the Modern State." The annual Church Congress was not held in 1929.

Dr William Temple was enthroned as Archbishop of York in York Minster on Jan. 10, 1929. During the year, the following bishops were consecrated: Canon H. A. Wilson as Bishop of Chelmsford and Prebendary W. C. Streetfield as Bishop Suffragan in Lewes, in Westminster Abbey on January 25. Dr F. S. Guy Warman was enthroned as Bishop of Manchester in Manchester Cathedral on February 1. The sudden death on February 13 of the Rt. Rev. W. O. Burrows, Bishop of Chichester, was followed two days later by that of the Bishop of Lewes who had been consecrated only three weeks before. Dr G. K. A. Bell, Dean of Canterbury, was appointed to succeed Dr Burrows and was consecrated in Canterbury Cathedral on June 11. The Ven. H. M. Hordern, Archdeacon of Lewes, was consecrated as Bishop of Lewes on November 1. The Rt. Rev. W. W. Perrin who had been Bishop Suffragan of Willesden resigned and was succeeded by the Ven. Guy Vernon Smith, Archdeacon of Colombo. The vacancy caused by the resignation of Bishop Hine, Bishop Suffragan of Grantham (who was however, to continue to act as an Assistant Bishop in the Diocese of Lincoln) was filled by the appointment of the Ven. E. M. Blackie, Archdeacon of Stow. Dr. B. O. F. Heywood, who had resigned the See of Southwell in 1928 on account of ill-health, was able to resume episcopal duties as Assistant

Bishop in the Diocese of York on the resignation of Dr. Gurdon, Bishop Suffragan of Hull.

There also were several changes in the overseas episcopate. On November 1, Canon F. W. Head was consecrated as Archbishop of Melbourne in succession to the Most Rev. Harrington C. Lees who died on January 10. The Archbishopric of Perth also was rendered vacant during the year by the death of the Most Rev. C. O. L. Riley; the vacancy being filled by the translation of the Rt. Rev. H. F. LeFann, Bishop Coadjutor of Brisbane. The Very Rev. F. deWitt Battv was elected to the bishopric thus vacated. The Rt. Rev. E. J. Palmer resigned the See of Bombay in September, returning to England to act as Assistant Bishop in the Diocese of Gloucester. Canon R. D. Acland was consecrated as his successor on November 6. Three Chinese bishops were consecrated during the year. The Revs. Ho-lin Ku and Cheng Tzi Song as Assistant Bishops in Western China and the Rev. P. L. T'sen as Assistant Bishop of Honan. The Rev. B. W. Pearcey was consecrated to Lehombo, the Rev. J. Frewer to Northwest Australia, the Rev. F. J. Western to Timnevelly, the Ven. H. W. Williams to Waiapu, and the Rev. C. A. W. Avlen to Zululand on the resignation of Dr. W. L. Vyvyan.

The church assembly budget for 1930, the income of which is contributed by the dioceses, was presented by Earl Grey at the summer session of the assembly and authorized the expenditure by the central board of finance of a sum not exceeding £145,903. Of this amount, £50,000 was required for the clergy pensions scheme and £32,700 was allocated for religious education. An appeal for sponsors for ordination candidates was again made in The London Times and elsewhere, and interest in the scheme was further stimulated by a radio address by the Lord High Chancellor on November 4. The year's contribution was £24,860, making £86,566 for the three years and enabling provision to be made for 450 candidates for ordination.

Officers of the church assembly in 1929 were: Chairman, the Archbishop of Canterbury, vice chairman, the Archbishop of York, treasurer, Col. Sir R. Williams, Bart., secretary, Sir Philip W. Baker-Wilbraham, Bart., chairman of the House of Bishops, the Archbishop of Canterbury, chairman of the House of Clergy, the Dean of Westminster, chairman of the House of Laity, the Earl of Selborne, K.G. Headquarters are at 8 Dean's Yard, Westminster, S. W. 1, London.

**ENGLISH ARCHÆOLOGY.** See ARCHÆOLOGY.

**ENGLISH LANGUAGE.** See PHILOLOGY, MODERN.

**ENTOMOLOGY, ECONOMIC.** The year was made notable in the field of entomology by the appearance upon North American shores of the dreaded Mediterranean fruit fly, *Ceratitis capitata*, a cosmopolitan pest that is probably the most destructive of all insect enemies of fruit, both citrus and deciduous. This insect for which the name "Medfly" is now quite commonly used, known to science for a hundred years, first appeared as a pest in Spain in 1842, since which time it has spread throughout the world until now the North American continent, with the exception of the peninsula of Florida, is the only large area upon which it has not become established. Its invasion of Florida citrus orchards with the threatened loss led to a period of uncertainty and business stagnation in the State

that was responsible for the closing of the doors of many banks. Its entrance constituted what was probably the most serious emergency ever faced by American horticulture.

On December 1, Dr. Charles L. Marlatt, who was responsible for securing the passage of the Plant Quarantine Act of 1912 and was placed in charge of its administration, relinquished the office of Chief to devote his entire attention to the work of the Bureau of Entomology. Lee A. Strong, a specialist in plant-quarantine work and long engaged in the administration of such work both in California and for the Federal Government, was appointed as Dr. Marlatt's successor. The year saw the passing of Dr. Frank H. Cntenden (qv), well-known entomologist who had been connected with the Federal Bureau of Entomology for more than 38 years. His death took place at Washington on September 15 at the age of 70.

**MEDITERRANEAN FRUIT FLY.** The discovery of the occurrence of the long-feared Medfly for the first time on the North American continent was made at Orlando, Florida, on April 6. Just how it gained entrance was not determined, although it was known that since the passage of the Federal Plant Quarantine Act of 1912 there had been numerous interceptions of it by the plant inspectors stationed at maritime ports of entrance. Its threat to American horticulture was at once met by the State of Florida and by the Federal Government, the former by immediately making \$50,000 available and mobilizing its forces and the latter through the transfer of \$40,000 by the Plant Quarantine and Control Administration for eradication work. A State quarantine was at once placed upon the known area of infestation together with a wide protective zone, the restriction being applied to new areas as they were determined. Steps were immediately taken to determine the extent of its spread, to destroy all fruit in infested and surrounding orchards, and to spray the trees concerned with an attractive poison bait as a substitute for the natural food thus removed. This was closely followed by the transfer by the Federal Government through congressional authorization of \$4,250,000 from the pink-bollworm fund.

Dr. Wilmon Newell, Chief of the Florida Plant Board, an experienced entomologist and administrator, was placed in direct charge of the administrative work. In the first survey the Medfly was found to occur in an area about 12 miles North and South by 6 miles East and West. In the course of four months' scouting the pest was found in more than 980 localities in 20 counties of the central and northern part of the peninsula. Infested fruit shipped out prior to the placing of the quarantine, much of which belonged to the cull class and was transported by trucks, was intercepted in New York, Ohio, North Carolina, Georgia, Louisiana, Arkansas, and Texas. In investigations conducted, the pest was found to breed in all fruits, with a few exceptions, and also to attack peppers, tomatoes, eggplant, and Lima and broad beans. It demonstrated a special liking for grapefruit and sour orange among the citrus fruits and freely attacked guava, fig, Surinam cherry, mango, avocado, peach, and pear.

The work of eradication at the height of the season required the service of some 5000 men, of whom 300 or more were directors, and the use of all available trucks, spraying machinery, etc.

The programme successfully employed in eradicating the Mexican fruit worm in the lower Rio Grande Valley was followed in the work against the new invader. It consisted in the establishment of a summer starvation period within the infested and protective zones during which there was a complete elimination of all host fruit and vegetables in a stage of growth attractive to the fly, and in place of such source of normal food, a sweetened bait was sprayed on the trees in orchards and elsewhere at frequent intervals. The effectiveness of the method was considered to have been fully demonstrated. As a result of the work, but one infestation of fruit—that on November 16—was found in Florida after August 27, and no flies were taken in the 6000 or more traps distributed through the eradication area, after August 12.

The magnitude of the problem together with its nation-wide concern led the Secretary of Agriculture to seek the advice of a committee of seven representative specialists in entomology and horticulture from various parts of the country. After a field survey of the situation in Florida this committee submitted a report emphasizing their belief that eradication work is not only practicable but an economic necessity. They further recommended the very considerable enlargement of the work under way and the modifications which in their belief would permit, under a system of sterilization, the interstate movement of citrus fruits from areas which previously had been considered infested—without risk of spreading the pest. The research work having shown that eggs and larvae in the fruit could be controlled by refrigeration to 28° F for 5 hours and held for 4½ days at 30° or by heating to 110° F inside temperature for 8 hours under an humidity of 90 per cent, this substitute for destruction of the mature fruit in the formerly infested areas, as recommended by the committee, was adopted—since no injury to the fruit was caused by these temperatures.

On December 18, both houses of Congress passed an emergency measure making \$1,200,000 immediately available for further work. President Hoover recommended to Congress on December 9 that an appropriation of \$15,381,000 be made to continue the control and eradication work until June 30, this amount being based upon the estimates of the Secretary of Agriculture and the Director of the Budget.

**MEXICAN FRUIT FLY.** This fruit worm was first discovered in the spring of 1929 after the elapse of almost two years, or from June, 1927, to April, 1929, during which no infestations were found in the Rio Grande Valley of Texas. It was discovered in stored fruit after the commercial citrus crop had been harvested and largely shipped. The premises of 10 growers and two packing houses in Hidalgo County were found to harbor it. In two instances larvae were found in grapefruit on the trees where such fruit had previously been overlooked in the cleanup and inspection. It was believed that the new infestation had been completely eliminated and that it would not be carried over into the 1929-1930 crop.

**ORIENTAL FRUIT MOTH.** Considerable injury by this fruit moth was reported from the Middle Atlantic, Southeastern and East Central States from New Jersey to Georgia and from Michigan to Tennessee. The indications were that it would be the cause of serious losses in peach orchards of the Niagara peninsula of Ontario.

**GIPLY MOTH.** Measured by the acreage of woodlands defoliated, gipsy-moth infestation was much more severe in 1928, with 262,000 acres stripped, than it had been for many years, and an even greater acreage was defoliated in the summer of 1929. Intensive eradication measures were employed to stamp out all gipsy-moth outbreaks in the barrier zone, the number of which nearly doubled in 1928. Only one small colony was found in the infested area in New Jersey, where eradication work had been under way since 1920. Scouting in the Province of Quebec failed to reveal any evidence of its presence there.

**BROWNTAIL MOTH.** This introduced pest, formerly equal to the gipsy moth in the extent of injury caused through defoliation of trees in New England, has for a considerable period continued to decrease in numbers to such an extent as to lose much of its early importance and interest. This appears to have been largely due to control by natural means such as disease and parasitic enemies, many of which latter have been introduced from Europe. During 1928 and 1929, however, it had increased in numbers in many sections in southern Maine, New Hampshire, and eastern Massachusetts, particularly where no attempt has been made to remove the winter webs or carry out spraying of trees in early summer and considerable defoliation has resulted. The area under quarantine was not administered in connection with the gipsy-moth quarantine.

**SATIN MOTH.** This defoliator of willow and poplar trees accidentally introduced from Europe into both New England and the State of Washington, occurs in the former region entirely within the gipsy-moth area and the quarantine against its spread was being enforced under the gipsy-moth administration. In a survey made during the summer of 1928 it was found greatly to have extended its range including 1172 towns in five States containing about 5,116 square miles. It was reported for the first time in woodland districts in New England. In Washington State though limited to the counties west of the Cascade Mountains the intensity of its infestation was gradually increasing and the pest was slowly spreading. Severe outbreaks of it with the tent caterpillar resulted in the total defoliation of hundreds of acres of brush and cottonwood stands in the western half of the Lower Fraser Valley of British Columbia.

**JAPANESE BEETLE.** The spread of the Japanese beetle continued with an increase of 8 per cent in the territory infested in seven States and the District of Columbia—a total of 21,353 square miles. New outlying points of infestation discovered during the season of 1929 include Boston, Mass., Providence, R. I., and Norfolk and Cape Charles, Va., the spread to which appears to have been due to automobile, train, or boat movement. Japanese beetle traps set with the geraniol attractant were used quite successfully in the isolated points found to be infested, nearly a ton of beetles representing 7,500,000 individuals having been captured in this way in 500 traps set at Roxborough, Pa., between July 11 and August 23.

**THE ASIATIC BEETLES.** The two species of beetles introduced from Japan with shipments of nursery stock with soil—designated as the Asiatic beetle (*Anomala orientalis*) and the Asiatic garden beetle (*Aserica castanea*)—were on March 2 quarantined against in the States in Connecticut,

New Jersey, New York, Pennsylvania, and Virginia and the District of Columbia. These beetles are somewhat closely related to the Japanese beetle and, in general, correspond with it in larval and adult habits. Their economic importance is largely due to their capacity to injure and destroy lawns and grass lands. The Asiatic garden beetle is in addition an active leaf feeder and attacks a large range of crop and ornamental plants.

**MEXICAN BEAN BEETLE.** The spread of this beetle continued and by October it had extended its range well up into Michigan, New York, and Massachusetts. The spread to the South and West, however, was negligible. It was reported as equally destructive over the entire infested territory. In Alabama and Mississippi, its damage was reported to be much more serious than in several years.

**THURBERIA, OR ARIZONA WEEVIL.** There was a very considerable increase of the thurberia weevil in cotton during the 1928 crop season in the Santa Cruz Valley south of Tucson, Ariz. The quarantine measures of control were the same as those enforced for the control and eradication or prevention of spread of the pink bollworm.

**ALFALFA WEEVIL.** The alfalfa weevil continued slowly to spread eastward toward the Mississippi Basin and is now firmly established in western Nebraska. It was discovered in August at Medford, Oregon, near the Pacific Coast and it seemed inevitable that it would make its way into all the principal alfalfa-growing regions of the West. It was found in the course of the examination of 130 freight cars that had contained alfalfa hay from infested regions that more than half were infested with alfalfa weevils, and that such weevils might remain in the cars almost indefinitely and be carried to almost all parts of the United States, some having been traced as far as New York and Los Angeles.

**EUROPEAN CORN BORER.** In the western area of infestation, the year was generally unfavorable to commercial damage by the corn borer. In a few fields in Ohio and Michigan losses in yield estimated at from 10 to 30 per cent were observed. Traces of injury were evident in more fields than ever before. Injury took place in only a limited district in Rhode Island and in adjacent Massachusetts. The natural spread of the corn borer by flight was normal, or between 20 and 30 miles. The survey of the year disclosed two fairly distant points of infestation, one in Oldham County, Kentucky, and the other in the southern point of Ohio, both on the Ohio River. The work of parasite introduction progressed rapidly and satisfactorily. More than one million additional parasites comprising nine species were liberated, principally in the States of the middle West.

**PINK BOLLWORM.** The extensive outbreak of the pink bollworm in 1927 in cotton of seven counties of West Texas involving scattered infestation of nearly 400,000 acres of cotton land, appeared to have been practically suppressed, only a single infestation having been found in connection with the 1928 crop and that consisted of only a few bolls in a field near Odessa. This favorable outcome was accredited to an intensive clean-up of the entire section under the special emergency allotment of \$400,000 and the climatic conditions during the winter of 1927-1928 unfavorable to the survival of hibernating larvae. Similarly unfavorable weather conditions were indicated by

the reduction almost to the zero point of the pink bollworm in portions of Arizona and New Mexico and in the El Paso Valley of Texas. Brewster County in the Big Bend district of western Texas was established as a non-cotton zone in order to eliminate the possibility of spread by flight from that highly infested region to western Texas and New Mexico. All the areas in western Texas, New Mexico, and Arizona still invaded by the pest were held under quarantine restrictions requiring the disinfection of cotton seed at gins, fumigation and compression of lint and linters, etc. The discovery of an infestation near Phoenix, Arizona, resulted in the enlargement of the quarantine area in that State to include five counties.

**DATE SCALE ERADICATION** The eradication work with the date scale was continued by the Federal Department of Agriculture in cooperation with the States of Arizona and California under Federal and State funds amounting to \$121,700. In addition to the intensive eradication work in the Coachella Valley of California and in the vicinity of Phoenix, Arizona, surveys were made in the Imperial Valley of California and other date-growing areas in the Southwestern States in order to locate and map the points at which date palms are grown and to clean up any outbreaks discovered in the course of the work.

**INSECTICIDES** Ethylene oxide, a fumigant not hitherto used for exterminating insects, was found by the Federal Bureau of Entomology to be highly toxic to certain species. It was found that those which commonly infest stored food products, clothing, and furniture can be killed easily by its vapors in concentrations that can be used without danger of fire or injury to human beings. Comparative tests have shown that the vapors are somewhat more toxic than those of carbon disulphide and about thirty times as toxic as those of cyanion tetrachloride. It was found by the Japanese beetle laboratory that acid lead arsenate applied uniformly over the surface of the soil at the rate of 35 pounds to 1000 square feet of lawn surface when new lawns are being made, would effectively protect from the beetle grubs for six years. Applied at the rate of five pounds to the same area, it will protect already established turf.

**INSECT TRANSMISSION OF PLANT DISEASE** It was found, first in Wisconsin and later in Kentucky and elsewhere, that the disease of alfalfa known as "yellows" is caused principally by the feeding of *Empoasca fabae*, a common and widely distributed leafhopper.

**BIBLIOGRAPHY** Recent works on entomology included K. W. Dammerman, *The Agricultural Zoology of the Malay Archipelago* (Amsterdam, 1929); H. F. Ewing, *A Manual of External Parasites* (Springfield, Ill., and Baltimore, 1929); S. A. Graham, *Principles of Forest Entomology* (New York, 1929); G. V. Hudson, *The Butterflies and Moths of New Zealand* (Wellington, 1928, 2d ed. rev. and enl.); R. Matheson, *A Handbook of Mosquitoes of North America* (Springfield, Ill., and Baltimore, 1929); J. G. **EPILEPSY.** Professor G. Carrière of Lille, France, has for the past 10 years advocated the continuous use of luminal and boropotassie tartrate drugs in combination. The seizures are brought to a halt in 75 per cent of all cases, but it is advisable to continue the treatment for several years and then slowly reduce it over another long period until a minimum dose is reached. The doses are small save in severe cases when they are increased as much as necessary to check the fits and keep them checked. Unlike the bromides, the borax salt causes no unpleasant symptoms, so that the patients can persist in their use indefinitely. Carrière is by no means the only one who recommends this treatment, for it has been tested at his request by a large number of neurologists. His own material thus treated during 10 years amounted to about 800 cases and the patients were not interned in asylums but were seen in dispensary and private practice. The daily dose of the borax salt is about 20 grains and of the luminal about 2 grains until the disease has been brought to a prolonged quiescence, after which  $7\frac{1}{2}$  grains of the first and one grain of the second will suffice. The author was silent as to the mental state, but the patients, as a rule, praise the treatment and are willing to continue it (*Bulletin de l'Académie de Médecine* Oct. 1, 1929).

**EPIRRUS.** A geographical expression applied to a territory, the northern part of which belongs to Albania and the southern part to Greece. The boundaries are indefinite. The Greek portion corresponds to the departments of Janina and Preveza, with populations in 1928 of 180,418 and 70,620, respectively. Northern Epirus had an estimated population of 250,000.

**EPWORTH LEAGUE** See **METHODIST EPISCOPAL CHURCH**.

**ERGOSTEROL** See **VITAMINS**, **VIOSTEROL**.

**ERITREA.** An Italian colony in Africa, on the coast of the Red Sea. It extends from Cape Dumeirah and the Strait of Babel-Mandeb to Cape Kasar, a distance of 670 miles. Area, 45,754 square miles, population, at the census of 1921, 402,793 natives and 4251 Europeans. The seat of government is Asmara, situated 7765 feet above sea level, with a population of 14,711, of whom 2500 were Europeans. Massawah is the principal trade centre, with a population of 12,275 in 1923. The natives are chiefly Coptic Christians and Mohammedans and, in the plateau region, they speak a dialect of Abyssinian, in the lowlands, Arabic. The local trade is almost entirely confined to camels, oxen, sheep, goats, and their products. Although there is abundant grazing land, the pastoral population is largely nomadic. There is considerable trade in palm nuts and pearl fishing is pursued at Massawah and in the Dahlak Archipelago. For the fiscal year 1928-29, the revenue and expenditure of the colony were estimated at Colonial revenue, 42,482,300 lire, expenditure for colonial administration, 25,497,050 lire, and for military purposes, 16,985,250 lire. Governor in 1929, Corrado Zoli (appointed in 1928).

**ERYSIPELAS.** Drs. David and Beatrice Seegal reported a study of 289 cases of facial erysipelas treated at the Massachusetts General

Hospital from 1870 to 1927 (*Journal of the American Medical Association*, August 16). During this long period there was no specific treatment of the disease, for the serum developed by Dr. Birkhaug had only recently been introduced. The mortality was within a fraction of 20 per cent, which is a high figure. The danger of infection to others is shown by the fact that the hospital personnel made up 13.5 per cent of the sufferers, while many cases of transmission from patient to patient were noted. No less than 48 per cent of the cases developed after admission to the hospital, about equally divided between medical and surgical patients. It was ascertained that in one group of patients, the untreated disease terminates spontaneously by a crisis which develops from the fourth to the seventh day—a fact which must be taken into account in any plan of specific treatment. Referring to the high mortality, the deaths cannot in the majority of cases be attributed solely to erysipelas, for many of the patients were suffering from other diseases, often serious, when the erysipelas developed. Cases of uncomplicated facial erysipelas should not have a mortality of more than 5 per cent, which can hardly be reduced under serum treatment, which naturally could not prevail against the underlying maladies.

#### ESKIMOS. See ANTHROPOLOGY

**ESSAYS.** See LITERATURE, ENGLISH AND AMERICAN, FRENCH LITERATURE, GERMAN LITERATURE, ITALIAN LITERATURE, SCANDINAVIAN LITERATURE, SPANISH LITERATURE, ETC.

**ESTONIA.** A Baltic state comprising the following portions of the former Russian Empire: The Province of Estonia, the islands of Moon Sound, the northern part of Livonia, part of the northwestern section of the district of the Pskov government, and a small portion of the Petrograd government, declared independent Feb. 24, 1918, and recognized by the League of Nations, Jan. 26, 1921. Capital, Tallinn (Reval).

**AREA AND POPULATION.** The total area is about 18,354 square miles, population, at the census of 1922, 1,110,538, of whom 92 per cent was Estonian, 1.5 per cent, German, and 6.5 per cent Russian and other nationalities. Five-sixths of the population are Lutheran, and the rest Greek Orthodox, Roman Catholic, etc. The population on Jan. 1, 1920, was estimated at 1,117,270 and in 1928, at 1,115,094. From 1923 to 1927, the average number of births was 20,783 and of deaths, 17,526, annually. Tallinn or Reval, the capital, had a population of 127,000 in 1926 (estimated 132,089 in 1929). Dorpat (Tartu), the seat of the university of the same name, had about 50,000 inhabitants in 1926 and 64,785 in 1929. Other large towns are Narva, a manufacturing town, with about 27,000, and Pärnu, on the Gulf of Riga, with about 21,663.

**EDUCATION.** Elementary education is free and compulsory. In 1927-28 there were 95,847 pupils in primary schools, 17,170 in secondary schools, and 9,124 in higher and professional schools. About 5.6 per cent of the adult population was illiterate in 1922. In 1925-26 there were 1356 elementary schools and 81 middle schools. Five teachers' seminaries, three navigation schools, commercial schools, agricultural schools, and industrial and art schools give higher and special education, and there are the University of Dorpat (founded in 1632), which had 4651 students in 1926, and the Technical Institute at Tallinn, with 484 students.

**PRODUCTION.** The chief pursuits of the people are agriculture and dairy farming. Aable land in 1927 totaled 2,528,000 acres, with 4,407,000 acres of permanent meadow and pasture, 2,220,000 acres of forests, and 1,632,000 acres of unproductive land. The total value of agricultural production in 1927-28 was \$65,800,000, of which \$29,300,000 represented field crops and \$36,500,000, animal products. The acreage and yield of the principal crops in 1928 were as follows: Wheat, 72,000 acres, 1,037,000 bushels, rye, 357,000 and 5,537,000, barley, 282,000 and 4,211,000, oats, 342,000 and 6,817,000, potatoes, 174,000 and 18,412,000, flax, 91,000 acres, 229,000 bushels of linseed and 17,200,000 pounds of flax fibre. Adverse weather reduced the crop yields in the same year, Estonia had 651,000 cattle, 658,000 sheep, 327,000 swine, 866,000 fowls, and 228,000 horses.

Seventy-three per cent of the population resides in the rural and agricultural districts. The output of meat and meat products in 1928 was 20 per cent higher than in the previous year.

In 1927, 28,235 workers were employed in industrial enterprises, 8983 in textiles, 4054 in woodworking, 3553 in metals, and 2037 in paper manufacturing. In 1928 the manufacturing industries increased their production, the number of employees increasing 7 per cent, while wages remained stable. Other industries produce cellulose, matches, hides and skins, oil (from shale), window glass, and cement.

**COMMERCE.** Estonia enjoyed the largest volume of foreign trade in her history in 1928, but the favorable balance of trade in 1927 was reversed in 1928 by a 37 per cent increase in imports. The total value of imports was \$35,200,000, while exports were valued at \$34,000,000, 20 per cent higher than in the previous year. The large growth of imports during the year was due to deficient crops, which created a demand for foreign foodstuffs, and to increased demands for most raw materials, textile fabrics, and machinery. Leading imports in 1928, with figures for 1927 in parentheses, were cotton, \$2,946,000 (\$2,406,000), rye, \$2,552,000 (\$1,333,000), sugar, \$1,789,000 (\$1,894,000), wool fabrics, \$1,389,000 (\$998,000), wheat, \$1,370,000 (\$1,093,000), cotton fabrics, \$1,034,000 (\$771,000), herrings, \$794,000 (\$570,000). Other imports were foodstuffs, hides and skins, tobacco, leather, hemp and jute, wool, rubber footwear, coal, kerosene, gasoline, iron and steel, agricultural machinery, automobiles, and superphosphates.

The chief exports in 1928, with comparative figures for the previous year, were potatoes, \$11,042,000 (\$624,000), butter, \$8,861,000 (\$7,377,000), lumber, \$4,494,000 (\$2,941,000), cotton fabrics, \$2,525,000 (\$2,325,000), flax, \$2,450,000 (\$2,766,000), cotton yarn, \$1,247,000 (\$1,199,000), mine timbers, \$1,071,000 (\$636,000). Other exports were cattle, beef, bacon, eggs, fresh fish, hides and skins, leather, jute sacking, sailcloth, veneers, chair seats, newspaper paper, cement, linseed, and matches.

**FINANCE.** During the fiscal year ending Mar. 31, 1929, actual net revenues were 92,162,678 crowns (\$24,576,714) and actual net expenditures, 90,786,855 crowns (\$24,209,828), leaving a surplus of 1,375,823 crowns (\$366,886). The budget estimates had anticipated a deficit of 3,587,185 crowns. A similar unexpected surplus (\$673,000) resulted from financial operations in 1927-28, when receipts were 4.5 per cent higher

and expenditures 54 per cent lower than the budget estimates. In the 1929-30 budget, gross receipts were estimated at \$4,801,000 and gross expenditures at 80,693,000 crowns. In 1928 the State received 3,000,000 crowns from the Swedish Match Trust for a 28-year match monopoly concession. During a period of four years, the same trust is taking over long-term obligations of the State Land Bank, State Railways, and other institutions enjoying state guarantee for an amount of 7,000,000 crowns.

On Jan. 1, 1928, the public debt amounted to 110,696,000 crowns (\$29,667,000). The external debt was held by other governments as follows: United States, \$19,707,000, Great Britain, \$9,534,000; and Sweden, \$253,000. The internal debt amounted to \$173,000. The crown, or kroon, was established as the unit of currency on Jan. 1, 1928, with a par value of \$0.2680. This was one of a number of currency and banking reforms inaugurated at the same date under the auspices of the League of Nations, others being the reorganization of the Bank of Estonia as a real central bank of issue, the creation of the State Mortgage Bank, and the issue of a foreign loan.

**COMMUNICATIONS** In 1928 there were 1156 miles of railway line in Estonia, 6306 miles of telegraph wire, and 41,582 miles of telephone wire. All three systems are owned by the Government. In 1927, 2672 vessels of 849,996 tons entered, and 2720 vessels of 854,975 tons cleared the ports of the country. The merchant marine of the Estonian Republic in the same year consisted of 67 steamers of 32,298 tons and 303 sailing vessels of 23,676 tons.

**GOVERNMENT** According to the constitution of the Estonian Republic, passed by the Constituent Assembly on June 15, 1920, and put into force December 20 of the same year, executive power is in the hands of a State head or "State Elder" and a ministry, both chosen by and responsible to the State Assembly; legislative power, in the hands of the State Assembly of 100 members elected for three years on the basis of proportional representation and by direct, universal, and secret suffrage. The Assembly forms the government and accepts its resignation, promulgates the laws, passes the budget, decides the financial policy generally, ratifies treaties, etc. The principle of the referendum is recognized for the proposal or amendment of the laws, but not in relation to measures affecting the budget, or war, peace, or foreign affairs. State Elder in 1929, A. Rei (Socialist), who was succeeded in July by Otto Strandmann, Labor party.

**HISTORY** A Conservative Coalition cabinet, headed by Otto Strandmann of the Labor party, replaced the Radical and Socialist ministry of A. Rei on July 9, 1929. Other members of the cabinet were August Keiem, Minister of Agriculture; Jaan Humeron, Education and Social Welfare; Oskar Koster, War; Jaan Lattik, Foreign Affairs; Tomas Kalbus, Justice and Interior; August Jurman, Ways; Johannes Zimmermann, Economics. Its programme included the revision of the constitution, the furtherance of agriculture, and a more equitable distribution of tax burdens. After months of negotiation, an agreement was reached between the governments of Estonia and Latvia relative to the establishment of a long-contemplated customs union. The Estonian-Latvian Mixed Commission was authorized to take up the question at its next meeting. The prospect of improved economic relations with

Lithuania was enhanced during the year by the elimination of a clause in the Polish-Estonian commercial treaty of 1927 to which Lithuania had objected. It was reported that the complications arising from Estonia's land reform were approaching final settlement. The most serious question concerned the compensating of foreign landowners for losses sustained in connection with the reform. A heavy increase in customs duties on textiles, leather goods, and other imports took place in September.

**ETHER DRIFT.** See PHYSICS.

**ETHIOPIA** (formerly **ABYSSINIA**). A country in West Africa between the Anglo-Egyptian Sudan and the Red Sea, comprising the provinces of Harrar, Equatorial provinces, Gondar, Jimma, Wollo, Shoa, Sellale, Edjow, Wollaga, Gumira, Gojan, etc. Capital, Addis Abeba. Ruler in 1929, Ras Tafari Makonnen.

**AREA AND POPULATION** The area has been variously estimated at from 350,000 to 430,000 square miles. The most recent estimate of the population places it at about 10,000,000, although the Abyssinians, properly so called, number less than 3,500,000. They are Christians of Hamitic origin. Addis Abeba has a population of from 60,000 to 70,000, of whom several thousand are foreigners. The other chief city, Harrar, has a population of about 40,000. In March, 1924, an edict was issued by Ras Tafari, providing for the gradual emancipation of slaves beginning with the children born of slaves.

**PRODUCTION** Ethiopia is a strictly pastoral and agricultural country, possessing numerous cattle, sheep, and goats. There are small and crudely cultivated crops of grain, cotton, sugar cane, dates, coffee, and grapes. Hides, skins, wax, grain, and coffee are the only products of sufficient quantity for export. The forests abound in valuable timber and include extensive growths of wild coffee plants. Ethiopia contains extensive deposits of gold, coal, copper, phosphate rock, rock salt, and sulphur. Iron, lead, petroleum, platinum, mercury, mica, tin, and tungsten also are found, but only platinum, potash, and gold are mined commercially. Foreign enterprise is introducing the more extensive cultivation of cotton and coffee. Mining concessions are held by German, Italian, and American concerns.

**COMMERCE** Exports consist mainly of hides and skins, coffee, wax, ivory, civet, and native butter, imports, of gray sheeting, cotton yarn, artificial silk, corrugated sheets and bars, hardware, cement, kerosene and gasoline, glass, and salt. The foreign trade is estimated to reach about \$12,000,000 annually, but no reliable figures are available. In 1928 exports to the value of \$351,079 went to Great Britain and imports valued at \$19,955 were received from that country. France, India, Italy, Germany, Japan, and the United States are other chief sources of imports.

**COMMUNICATIONS.** Transport for the most part is still conducted over mere tracks by means of mules, pack horses, donkeys, and in some districts, camels. The only railway is French controlled and connects the capital with the port of Jibuti, over a distance of 488 miles. Trains run twice weekly in each direction. There are 2000 miles of telegraph line, telephone connections between Addis Abeba and the chief towns, and 10 post offices. A motor highway is projected from the port of Assab in Eritrea, where Ethiopia has been granted port facilities by the Italians, to Dessie in Ethiopia. In 1929 a British-Indian

firm, with headquarters at Jibuti, announced that it had obtained a concession to build a system of motor roads linking British Somaliland with the rich Harar Province in Ethiopia. Construction work would be under way within a year, it was said. Jijiga in eastern Ethiopia has been chosen as the central point in the system, with the roads radiating to the two British Somaliland ports of Zeila and Berbera and to the three Ethiopian cities of Harar, Aisha on the Franco-Ethiopian Railway, and Dagabbur.

**GOVERNMENT** Under the constitution adopted Oct. 31, 1907, and modified in 1919, the supreme power rests with the King, who, since 1907, has been assisted by a cabinet and, since 1910, by the Council of Elders. There is no popular representation, the governmental system being essentially that of a feudal monarchy, in which the Coptic Church plays an influential and conservative rôle. The present King has striven to modernize the medieval political institutions since his coronation. In 1923 Kithopia joined the League of Nations. King in 1929, Ras Tafari Makonnen (crowned Oct. 7, 1928, after serving as Regent since 1910).

**ETHNOGRAPHY.** See ANTHROPOLOGY.

**ETHNOLOGY.** See ANTHROPOLOGY, EXPLORATION.

**EUROPEAN CORN BORER.** See CORN, ENTOMOLOGY, ECONOMIC.

**EVANGELICAL CHURCH.** A denomination formed by the union of the Evangelical Association and the United Evangelical Church. The former was the outgrowth of a religious movement started in Pennsylvania in 1800 by the followers of Jacob Albright. In 1892 a number of ministers and members organized themselves into the separate denomination known as the United Evangelical Church. At length the growing conviction that the two churches should be reunited led to the appointment of commissions which drew up the so-called enabling act. The new organization was officially established in Detroit in 1922. At the time of merging, the Evangelical Association had 167,416 church members and the United Evangelical Church, 92,001. At the end of 1929 there was a total membership of 258,232, 13,223 of the 21,666 persons received into membership during the year coming on profession of faith.

In 1929 the denomination had 23 conferences in the United States, two in Canada, one in Japan, two in Germany, and one in Switzerland. There were 1948 itinerant preachers and 392 local preachers. Sunday schools numbered 2742, of which 602 were in Europe, chiefly in Germany and Switzerland. Of the total enrollment of 357,003 persons, 39,978 were in Europe. The Christian Endeavor Society membership was 11,529. There were also 1365 women's missionary societies with a membership of 39,989. The total value of all church property was \$34,624,242. The amount of money raised during the year totaled \$7,182,902, an average of \$27.81 per member.

The chief schools of the denomination are North Central College and Evangelical School of Theology in Naperville, Ill., Western Union College in Le Mars, Iowa, and Albright College and School of Theology in Reading, Pa. The denomination also maintains two orphanages and six old people's homes in the United States, as well as several hospitals. Official periodicals are the *Evangelical Messenger* (Cleveland, Ohio) and *Christliche Botschafter* (Harrisburg, Pa.). A

quadrennial general conference was to be held in Milwaukee, Wis., in October, 1930.

**EVANGELICAL SYNOD OF NORTH AMERICA.** The A religious communion strictly evangelical in principle as historically crystallized from the Reformation of the sixteenth century and as embodied in the Reformed and Lutheran doctrinal statements, accepting these statements as far as they agree. When they disagree, the Evangelical Synod adheres strictly to the passages of Holy Scripture bearing on the subject and avails itself of the liberty of conscience prevailing in the Evangelical Church. The communion was founded in 1840 at Gravois Settlement, Mo., and was consolidated in 1877 with similar communions. It is organized in 19 districts, its churches having extensive power of self-government. In 1929 it had 1400 congregations with 1226 pastors and 352,595 communicant members and 1300 Sunday schools with 192,234 members. The quadrennial conference, attended by presidents of districts and clerical and lay delegates, was held Oct. 8-16, 1929, in Rochester, N. Y.

Money raised by the denomination for all purposes in 1928 amounted to \$6,437,400. Church property was valued at \$41,301,740. Missionary work was carried on in the United States, India, and Honduras, the board of foreign missions reporting for 1928 an income of \$204,518. In the United States there were more than 100 missionaries, men and women, active in about 135 communities. In India there were 14 men, one of them a medical worker, and 18 women serving as missionaries, in addition to 333 native workers. In Honduras, there were 11 missionaries at two stations. The denomination maintains three institutions of learning: Eden Theological Seminary, Webster Groves, Mo., Elmhurst College, Elmhurst, Ill., and Oakwood Institute, Cincinnati, Ohio. It also published *The Evangelical Herald*, *Der Friedensbote*, and *The Light Bearer*. The Rev. J. Baltzer, D.D., of St. Louis was president of the Evangelical Synod in 1929.

**EVOLUTION.** See ZOOLOGY.

**EXCAVATIONS.** See ARCHEOLOGY.

**EXCHANGE, FOREIGN.** See FINANCIAL REVIEW.

**EXHIBITIONS.** See ART EXHIBITIONS.

**EXPERIMENTAL PSYCHOLOGY.** See PSYCHOLOGY.

**EXPERIMENT STATIONS.** See AGRICULTURAL EXPERIMENT STATIONS.

**EXPLORATION.** In addition to exploratory work in little-known areas, the year 1929 was noteworthy because of the number of collecting expeditions dispatched by museums anxious to preserve the indigenous fauna, flora, and native customs of undeveloped portions of the globe. Arctic and anthropological expeditions are described under their separate headings. Expeditions in the Polar Regions are treated under POLAR RESEARCH.

**NORTH AMERICA.** Extensive explorations were undertaken by the U. S. Navy in completing the aerial survey of southeastern Alaska which was begun in 1926. In 20 flying days, four amphibian planes photographed 12,000 square miles of mountainous terrain, a feat which by the usual methods of ground survey would have taken years to accomplish. Surveys of the natural resources of Alaska were carried on by the Bureau of Fisheries, the Forest Service, and the Geological Survey. The Graves-Thorne Expedition col-

lected walrus and caribou specimens for the Field Museum. Father Hubbard of Santa Clara University visited the Mt Katmai area and found many changes had occurred there. In the Canadian north, the airplane has played an important rôle in exploration. Reconnaissance geological and topographical expeditions have been greatly expedited and the MacAlpine aerial prospecting party which was lost north of Baker Lake was later rescued by airplane. As in Alaska, aerial surveys have facilitated the mapping of the districts in Ontario and Manitoba, where innumerable lakes make travel by foot very arduous.

In the Great Slave Lake district, W. B. Hoare continued his study of the Musk Ox Sanctuary. The universities of Wisconsin and Chicago conducted surveys of the settlements in the Peace River Valley, a new region of pioneer development. Early in 1929, Bob North and his father made an 800-mile trek through little-known regions of Ontario and Manitoba to York Factory. Captain Bartlett spent the summer on a hunting cruise off the coast of Labrador and an English expedition under H. G. Watkins spent the winter of 1928-29 exploring in Labrador.

In 1929 much detailed explorational work was carried on in the United States, while State geological surveys continued their inventories of local resources, and considerable independent work was instigated by private institutions. Princeton geologists found three new faunal horizons in Wyoming, Barnum Brown hunted dinosaur remains in Nevada, and Dr. Simpson sought fossils in New Mexico for the American Museum of Natural History. The University of California sent one palaeontological expedition to Texas and another to the vicinity of Sacramento, while for the U. S. National Museum, Gilmore hunted Cretaceous fossils in New Mexico, Reaser collected fossils in Montana, and Yale University cooperated in excavating an old fumarole in New Mexico for the remains of an ancient sloth.

**CENTRAL AMERICA.** William Beebe carried on extended studies of bathypelagic fish at Nonsuch Island, Bermuda, and in the Bahamas, the Field Museum-Williamson Expedition studied undersea photography. The 1929 A. V. Arnold scientific cruise was in Caribbean waters, while James Bond of the Philadelphia Academy of Sciences continued his ornithological collecting in the West Indies. The American Museum of Natural History dispatched collecting expeditions to Yucatan, Haiti, and Dominica, scientists at the research station at Barro Colorado Island, in the Canal Zone, continued their biological studies, and the mapping of the boundary between Colombia and Panama was entrusted to Dr. Eichen, to be aided in this difficult task by aerial photography. The volcanoes of Costa Rica were studied by E. Dunn of Haverford College and Dr. and Mrs. Britton continued the botanical survey of Porto Rico under the auspices of the New York Academy of Sciences.

**SOUTH AMERICA.** A biological reconnaissance of much of South America was the aim of the Otley-Anthony Expedition of the American Museum of Natural History. Mammals also were to be collected from key localities. Dr. Dickey's 1929 expedition for the Museum of the American Indian was wrecked on the Orinoco and his attempt to reach the Piaros Indians had to be abandoned. General Rondon, in the course of delimiting the Brazil-Guianas boundary, described considerable unexplored territory and the Oxford University

Exploration Club conducted a botanical expedition to British Guiana, while Dr. Hershkovits continued his study of the natives on the Surinam River. Coxy of the Philadelphia Academy of Sciences collected insects in Ecuador and a group from the California Institute of Technology reported the successful ascent of Sangay and other volcanic peaks in that country. Botanical expeditions were dispatched by the U. S. National Museum to the upper reaches of the Amazon, by the Field Museum to Brazil and Peru, by Harvard University to southern Brazil, and by the Brooklyn Botanical Garden to Brazil, while the birds of eastern Peru were studied by an expedition from the Philadelphia Academy of Sciences. Two German explorers reported finding a link between the Amazon and La Plata rivers.

**AFRICA.** In 1929 a determined assault was made upon the Sahara, that inhospitable region which makes so effective a barrier between the French colonies of North Africa and of the Niger. Automobile journeys from Algeria to the Niger were made by the Director of the Southern Territory, by Prince Sidi el Bourbon, by P. de Varlemont, by the Glovers on their search for mammals and commercial gums, and by Lieutenant Mjoberg for the Royal Swedish State Museum. Bureau de Laborie continued his studies in Mauritania and Yale University cooperated with the Finestone interests in a forest survey of Liberia. Central Africa was visited by a Swiss photographic expedition, Columbia University and the American Museum of Natural History united in a study of gorillas in the Belgian Congo, and Professor Bieman of the University of Lund visited Central Africa to collect plants. The Gray African Expedition of the Philadelphia Academy of Sciences collected mammals for exhibition purposes, as did also the Public Museum of Milwaukee, and the Colorado African Expedition under Hoelder made a photographic record of an automobile trip across central Africa, while in Angola, an ethnological collection was assembled for the Field Museum. The Abyssinian Highland was visited by the Harold White-John Coats Mammal Expedition of the Field Museum, by M. Graule of the French School of Oriental Languages, and by the Sanford-Legendre of the American Museum of Natural History. Eritrea was explored by Baron Franchetti and East Africa was visited by Hitchcock of the U. S. Dept. of Agriculture in order to collect native grasses, by A. S. Straus in search of big game for the American Museum of Natural History, and by Bailey Willis in the interests of volcanology. Migeod of the British Museum collected dinosaur remains in Tanganyika, Lovelidge of the Harvard Museum of Comparative Zoology captured reptiles in the Livingstone Mountains, and the Martin Johnsons returned to East Africa to continue their photographic record of native and animal life. In Southwest Africa, the National Geographic Society and the Smithsonian Institution continued studies for solar radiation at Mt. Brukkaros and the Harvard University Observatory Expedition reported finding the world's largest meteor near Grootfontein in Madagascar. Dr. Swingle of the U. S. Dept. of Agriculture and Professor Humbert of the University of Algiers cooperated in botanical work. Palaeontological collections also were made there under the auspices of various British, French, and American museums.

**ASIA** The Morden-Graves Expedition of the American Museum of Natural History spent some time during 1929 in Kazakhstan hunting the big-nosed antelope and planned to continue to the Amur River. A general expedition to Central Asia under E. A. Waters was dispatched by the museums of Harvard and Pennsylvania universities. The Roerich Expedition, after having spent three years collecting information on the philosophy and culture of Central Asia, returned to the United States. A German expedition, under the Duke of Saxe-Weimar, explored the Karakorum Mountains; a party from the Berlin Ethnological Museum was engaged in Chinese Turkestan, and a German-Soviet expedition attained Peak Garmo, the highest in the Soviet Pamirs. The Dutch explorer, Visser, returned to the scene of his former expeditions in the Karakorum and a Swedish expedition under Sten Bergman traveled in Northeastern Siberia as did Professor Chernyshevskoy of the Soviet Russian Academy of Sciences. In 1929 the discovery, in the vicinity of Vladivostok, of the oldest fossil plants known was announced, and throughout the whole of the Soviet territory scores of expeditions—too many to note separately—were studying the peoples and natural resources of the country. The Mongolian expeditions of the American Museum of Natural History were discontinued due to the Chinese insistence that a Chinese representative should accompany the expedition and that the collections should be retained in China, but a French expedition accepted even more stringent terms and shortly was to begin field work in western China. Sven Hedin, after a hurried trip to the United States, continued his explorations in the Gobi Desert. This expedition was honored by the printing of a special stamp by the Government at Nanking. Mt. Kanchenjunga in the Himalayas was twice assaulted—once by a lone American who perished and once by a party of German Alpinists who were turned back. The Roosevelt-Field Museum Expedition to Siam and China acquired specimens of the giant panda, as well as of many rare birds and mammals. Herman Norden explored the vicinity of the Mekong River and an ornithological collection was made by Schaumensee for the Philadelphia Academy of Sciences in Siam, Burma, and Sumatra.

**OCEANIA** In the Dutch East Indies, the *Snellius*, of the Netherlands Meteorological Institute, pursued oceanographical studies, the All-American Radio Research Expedition reached the Muring River in Borneo, and Dr. Brouwer of Delft University continued his geological studies, this time in the Celebes. The Cornelius Crane-Field Museum Expedition visited many islands and brought back a wealth of material and former Governor Pinchot was accompanied by a number of scientists on a cruise which included the Galapagos Islands and eastern Polynesia. Rollo Beck of the American Museum of Natural History collected birds in New Guinea, as did Lee Candall of the New York Zoological Gardens.

**OCEANS** The nonmagnetic yacht *Carnegie*, of the Carnegie Institution, reported two submarine mountain ranges off the coast of South America and a new deep of more than five miles between Japan and Guam, on November 29, an explosion totally destroyed the ship and killed Captain Ault, its commander. The Danish research ship *Dana* continued to investigate the giant eels of the Pacific and the *Discovery II* began further investigations of whales in south-

ern waters. The Iselin Expedition from Harvard carried on salinity and depth studies of the Gulf Stream. See ANTHROPOLOGY.

**EXPOSITIONS.** Most conspicuous among these events in 1929 were the expositions held in Spain in Barcelona and Seville, and in Poznan, Poland. A convention concerning international expositions, at which representations of 40 nations were present, was held in Paris toward the close of 1928, when the following definitions were adopted. First, general expositions involving the construction by participating nations of buildings and displaying products of human activity in many branches of science and industry. These will be limited to not more than one every 15 years with a six-year period between any two of these expositions for any single nation. Second, expositions that do not involve the construction of national buildings will be limited to not more than one every 10 years in any one country. Third, special expositions concerning only one branch of science or industry will be limited to not more than one every five years. A permanent bureau was organized, the duty of which will be to authorize every exposition falling within the province of the convention. It will also be the work of the permanent bureau to see that expositions are properly located geographically, so that each part of the world receives its opportunity.

**BARCELONA INTERNATIONAL EXPOSITION.** This exposition was given full description in the NEW INTERNATIONAL YEAR BOOK for 1928, p. 244. Owing to the death of the Queen Mother, Maria Cristina, the opening of the exposition was postponed until May 15, when the King, Queen, and other members of the royal family, as well as the representatives of foreign governments and delegations representing all of Spain's important activities were present. The imposing approach to the National Palace, one of the permanent buildings, was the most striking artistic feature of the ensemble.

**IBERO-AMERICAN EXPOSITION.** Preliminary and other details concerning this exposition will be found in the YEAR BOOK for 1927, p. 280, and for 1928, p. 243. Owing to the death of the Queen Mother, Maria Cristina, the date of opening this exposition was again postponed until May 9, and then in the presence of King Alfonso, members of the royal family, Premier Primo de Rivera, and delegates from other nations, it was officially opened with appropriate ceremonies. The inauguration took place on the Plaza de España, which was decorated with the flags of all countries. It was there that the King received the foreign dignitaries and diplomats, including Ambassador Ogden Hammond, for the United States. Historical standards of Spain were among those floating over the Plaza which presented a colorful appearance in the bright sunshine.

The formalities were preceded by a procession in which the committee went to the Exposition grounds in the royal coaches escorted by the royal guard in full uniform. The exposition was blessed by Archbishop Hudain of Seville and his clergy. One of the finest of the pavilions at the exposition was constructed by the United States and that nation was particularly congratulated by the King and General Primo de Rivera, who thanked the delegates for their collaboration. The King visited the Exposition grounds accompanied by the Governor and in the evening

he presided at a great banquet in the principal casino at the Exposition, the entire royal family attending. There was a large attendance on the opening day. As is customary at expositions, special days were observed at both Barcelona and Seville, notably October 12, Columbus Day, or as it is called in Spain, "Día de la Raza," "The Day of the Race."

An industrial arts exposition was held in Toledo, Spain, during Holy Week. Ceramics, linens, artistic iron work, lanterns, glass, arms and armor, tapestries, rugs, silks, and furniture, all made and designed by artists of renown, were exhibited. The exposition was representative particularly of the art crafts of Toledo and vicinity.

**POLISH NATIONAL EXPOSITION** CLARK The 10th anniversary of the restoration of Poland as a sovereign nation, this exposition was held in Poznan from May 15 to September 15. The scope of the exposition included every branch of Polish activity—agriculture, industry, commerce, municipal and other public utilities, and road building, as well as scientific, cultural, and social achievements. Americans of Polish descent had their own pavilion, showing their contribution to the progress of the United States. Although national in name, the exposition was universal in scope, affording an exceptional opportunity for Americans interested in developing exports to learn at first hand the potential market possibilities in Poland. Various meetings and conventions of international scientific and professional organizations were held concurrently. The programme included also a series of international athletic events, with automobile, air, and motor-boat races.

The exposition was formally opened on May 15, by President Moscicki with his cabinet and the diplomatic corps. After an inspection of the exhibition, the President visited the building donated by Polish Americans, where the Polish writer, Sieroczewski, greeted the President on behalf of the Polish National Union in the United States and the Chief Executive expressed delight in the splendid organization of the Americans. On the opening day the attendance was 30,000. The exposition was a decided success, the attendance being over 4,500,000 visitors, including nearly 330,000 school children and nearly 500,000 peasants. The liabilities amounted to 5,000,000 zlotys, covered by entrance fees and returns from the sale of the exhibition buildings, which are to be converted into schools, university laboratories, and dwellings. The closing ceremonies ended in a traditional "polonaise" through the exhibition grounds. The exposition revealed to the Poles and the outside world the great strides in the country's development and prosperity made in the first decade of its independence.

**FUTURE EXPOSITIONS** Chicago Considerable progress was made during the year in the plans for the World's Fair to be held in Chicago in 1933. As announced in the *YEAR BOOK* for 1928, p. 244, it was proposed to build islands along the lake front on which to erect the exposition buildings. Early in 1929, it was decided to construct the exposition buildings so that they will connect in the form of a "tree," the buildings branching out from a central building, connected by terraces, moving sidewalks, canals, and lagoons. The architects planned to avail themselves of the picturesqueness provided in the physical set-

ting of lake front and islands. The canals, which will be constructed when the islands are "made," will run directly through the various exposition structures and will be equipped with flatboats, in which visitors can rest and see the sights at the same time.

There was to be about 6,000,000 square feet of space for exhibition purposes, and the construction work was expected to cost between \$60,000,000 and \$70,000,000. In order that a financial standing should be secured, Gen. Charles G. Dawes took over the task of raising a \$10,000,000 fund to guarantee the fair, and his first day's work netted \$4,000,000 in guarantees from the leading business men. The day following he found subscribers for the additional \$6,000,000. In May, it was announced that Maj. Lenox Riley Lohr, a native of Washington and recently editor of the *Military Engineer*, had been named manager of the next Chicago World's Fair.

The formation of a special committee of national leaders in all fields of pure and applied science to cooperate with the trustees of "The Century of Progress," which was the name officially adopted for the international exposition, was announced in June. This body of eminent advisers was to be known as the National Research Council advisory committee to The Century of Progress. The committee was formed by the National Research Council and was to be the recognized national scientific body to aid in the organization of the scientific features of the project.

The dominant note of the exposition was to be scientific progress in industry. The executive group of the advisory committee, appointed by Dr. George K. Burgess of the University of Chicago, included Dr. Frank B. Jewett, Clark L. Dunham, Prof. M. I. Pupin, Dr. William Allen Pusey, Dr. George K. Burgess, Dr. Vernon Kellogg, and Dr. Max Mason, and assisting this group will be the large general committee. President Rufus C. Dawes announced in June that "the supreme feature, architecturally and educationally, will be the Science Building. It will be the dominating note in the grouping of structures and of the spirit of the exposition. It will exhibit discoveries in law, science, and the inventions. The fair will be more of an exposition of methods and problems in science, the arts, and the industries than an exhibition of bales of fabrics and tangle-loads of products."

A great pageant showing a century of progress in the transportation field—highway, waterway, railway, and airway—was to be one of the big features of Chicago's 1933 centennial celebration. A plan was being developed by Edward T. Foss, who was director of the Fair of the Iron Horse, which the Baltimore & Ohio Railroad staged in 1927, acting in an advisory capacity. Wagon and automobile manufacturers, airplane builders, and the railroads of the country were to combine in presenting a great spectacle peopled with characters costumed in the fashions of various periods from 100 years before up to 1933.

**New York.** In the autumn of 1929, it was decided that plans for an exposition in New York City had not been abandoned, and according to Joseph Brown, secretary of the Washington Exposition of 1932, Inc., members of the commission were making a tour of the State to ascertain public sentiment on the proposal for a fine

arts, commercial, industrial, and educational exposition in 1932.

**Belgium.** As noted in the YFAR BOOK for 1928, p 244, Belgium was to celebrate the 100th anniversary of its independence as a nation in 1930 by an international exposition to be held simultaneously in *Antwerp, Brussels, and Liège*. The Antwerp exposition was to be devoted to the colonies, shipping, transport, as applied to commerce, and the Flemish art prior to 1830, while in Brussels, an exhibition of Belgian art since 1830 was to be shown. In *Liège*, the exhibition was to be devoted to a demonstration of what the sciences and applied sciences owe to research workers.

A site with connecting bridges on both sides of the River Meuse had been selected and it included about 165 acres on which separate exhibition buildings devoted to the physical sciences and mathematics, chemistry, mineral, medical, and industrial sciences, and scientific and industrial tuition, as well as separate buildings devoted to metallurgy and engineering, mining, electricity, mechanics, small arms, cycles and motorcycles, chemical industries, crystal glass and ceramics, textile industry, transports, and civil engineering and public works were in the course of erection, also, there was to be a woman's palace in which were to be exhibited all kinds of wearing apparel, jewelry, and objects pertaining to woman's activities. In *Liège*, there was to be also an exhibition of Walloon art prior to 1830. Active arrangements had been made for nineteen international congresses and many of the larger nations, notably Brazil, China, France, Great Britain, Italy, Japan, Peru, and Sweden, officially announced their adhesion to the exposition, which has received a subsidy of 10,000,000 francs from the Belgian government and will be under the patronage of their majesties, the King and Queen of the Belgians, and the presidences of their highnesses, the Duke and Duchess of Brabant.

**TRADE FAIRS.** *Lyons* The International Sample Fair in Lyons, France, was held Mar 4-17, 1929. Exhibitors to the number of 3513 were registered. The exhibits included metal manufactures, building materials, chemical products, toys, foodstuffs, automobiles, jewelry, clocks and watches, leather articles, furs, furniture, ceramics, and almost all types of merchandise.

The *Bordeaux Sample Fair* was held from June 16 to July 12, 1929, and the fifth annual *Marseilles Fair* was held in the *Parc de l'Exposition, Marseilles*, from Sept. 14-20, 1929. Colonial products were a feature of the exhibits.

**Leipzig.** The usual spring fair was held in Leipzig Mar 3-9, 1929, and occupied 46 buildings, housing a great variety of exhibits. Several nations erected their own buildings, and in many cases with the active support of their respective governments. The housing facilities of the fair this year were considerably expanded by the construction of new buildings, including the "Petershof," which contained the exhibits of applied arts and some toys and musical instruments; there was also a structure for the display of confectionery, with space for 200 exhibits. These new buildings added greatly to the 300,000 square meters of exhibiting area which had been available in 1928.

The toy section consisted of 817 displays, exhibits of glassware and ceramics numbered 720, while those of textiles reached 647 and those of

various household appliances, 535. The technical fair, also known as the engineering and building fair, remained open until March 13. This new hall, bringing the total number up to 16, added some 9300 square meters to the available exhibiting space. As the name implies, this part of the show was devoted to the display of technical products for all lines of industry. Among others, complete exhibits of machinery and machine tools attracted considerable attention, other important displays were those of iron and steel goods, electrotechnical appliances, etc. In 1929, in addition, there were held various meetings dealing with packing methods and factory technique.

The American participation was greater than ever before, both as to buyers and exhibitors. There were nearly 3000 buyers from all parts of the United States, representing a wide variety of interests, and more than 100 characteristic American products were on exhibition. Records of the fair show that the United States had co-operated for more than 100 years. In 1783, when Benjamin Franklin was envoy to Paris, Leipzig sent its representatives asking his interest in obtaining American exhibits.

The autumn fair was held Aug 26-31, 1929. The number of exhibitors was about 8000, or 1000 less than the previous autumn, and included 670 foreign firms from 21 countries, among them, 70 from the United States. The total space covered by foreign firms was slightly increased to about 500,000 square feet, a great percentage of this space being occupied by exhibitors of motor cars from the United States. "Quality" seemed to be the slogan of the autumn fair, a majority of the exhibitors following that idea, there was an absence of the customary cheaply made goods. The early orders indicated that the business would reach a total . . . of the previous year's by about . . . . It was hoped that Americans would organize their own section at the Leipzig Fair. The French, English, Japanese, and other nations all began with separate sections, and were reaching the entire European market through Leipzig. Americans could do well in Leipzig, especially in lines where their manufactures excel, such as machinery and office equipment. See, also, CHEMISTRY, INDUSTRIAL.

**FALCON ISLAND.** Located in the southwestern part of the Tonga or Friendly Islands in the South Pacific (20° 19' south latitude, 175° 25' west longitude). This volcanic island reappeared for the third known time in October, 1927, when a violent eruption caused the emergence of a volcanic crater which, in May, 1928, had a maximum diameter of about 2 miles and a height of 305 feet. Named for H.M.S. *Falcon*, which visited the spot in 1865 and reported a shoal, the island attained an elevation of 200 feet by 1895. So quickly did it disintegrate that by 1898 it had practically disappeared. Two years later, it was 10 feet high, but in 1913 a shoal was again reported. The eruption of 1927 was the most violent on record. Explanation lies in the fact that this island is the top of an active volcano.

which, at times, erupts large quantities of easily eroded lava and pumice.

**FALKLAND ISLANDS.** A colony of the British Crown, situated in the South Atlantic, 300 miles east of the Strait of Magellan consisting of East Falkland, 2580 square miles; West Falkland, 2038 square miles, including in each case various adjacent small islands, about 100 in number. In addition to these are South Georgia, with an estimated area of 1000 square miles, and other dependencies, including the South Shetlands, the South Orkneys, the Sandwich group, and Graham Land, together with all unknown seas and lands of the Antarctic Ocean extending as far as the South Pole. The estimated population in 1926 was 2271. In 1926 the birth rate was 25.98 per thousand and the death rate, 14.09. The chief town is Stanley, with 950 inhabitants in 1926. Education is compulsory. Sheep raising is the chief industry, although whaling is carried on with some success. In 1926 there were 605,075 sheep with about 2,248,000 acres of pasturage. In 1927 the imports were valued at £769,305 and the exports, at £4,125,498. The chief imports were groceries, coal and coke, hardware and machinery, the chief exports, wool and whale produce. The revenue in 1927 was £274,494 and the expenditure, £203,151. Governor in 1929, Arnold W. Hodson.

**FARNUM,** DUSTIN American actor, died in New York, July 3, 1929. He was born of a family of actors on May 27, 1876, in Hampton Beach, N. H. He made his debut with the Ethel Tucker Company in 1897. He played always in romantic and virtuous roles, achieving his greatest success in the title part of *The Virginian*. In motion pictures, also, to which he went from the stage, he portrayed a similar type of hero.

**FAROE ISLANDS.** A group of 21 islands belonging to Denmark and lying midway between the Shetlands and Iceland Area, 540 square miles, population in 1925, 22,835. See DENMARK, under *History*.

**FARQUHAR,** JOHN NICOL English educator and student of comparative religion died on July 17, 1929, in Manchester. He was born in Aberdeen, Scotland, Apr. 6, 1861, and was educated at the universities of Aberdeen, Manchester, and Oxford. He was a missionary in India from 1891 to 1923, and in his subsequent teaching, writing, and lecturing, he endeavored to

interpret Indian thought and religion. After 1924 he was professor of comparative religion in the University of Manchester. He was a lecturer at Hartford Theological Seminary, Hartford, Conn., in 1913, and at Oxford, after 1927. He wrote *A Primer of Hinduism* (1912), *The Crown of Hindueism* (1913), *Modern Religious Movements in India* (1915); *An Outline of the Religious Literature of India* (1920).

**FASCISM.** See GERMANY, AUSTRIA, ITALY, under *History*.

**FEDERAL COUNCIL OF THE CHURCHES OF CHRIST IN AMERICA.** An organization established in 1908 by 28 Protestant denominations to act for them in matters of common interest. At the end of 1929, it included most of the major Protestant denominations of the United States, as follows: Northern Baptist Convention; National Baptist Convention, Free Baptists, Seventh-day Baptists, General Convention of the Christian Church, Churches of God in North America (General Eldership), Evangelical churches, Disciples of Christ, Evangelical Church of North America, Friends, Methodist Episcopal Church, South, African Methodist Episcopal Church; African Methodist Episcopal Zion Church, Colored Methodist Episcopal Church in America, Methodist Protestant Church, Moravian Church, Presbyterian Church in the United States of America, Presbyterian Church in the United States (South), Protestant Episcopal Church, Reformed Church in America, Reformed Church in the United States, Reformed Episcopal Church, United Brethren in Christ, United Presbyterian Church of North America, United Lutheran Church in America. Of these, all were full and official members with the exception of the United Lutheran Church, whose relationship was consultative, and the Protestant Episcopal Church, whose national council co-operates in certain specified areas of work.

The total number of local churches included in the constituency of the Federal Council, according to the Census of Religious Bodies issued by the United States Government in 1926, was 136,076, clergymen numbered 116,644 and the total communicant membership, 22,010,312. The council, made up of members designated by the several denominations to act for them, meets quadrennially, the last meeting having been held in Rochester, N. Y., in 1928. It has an executive committee, of about 100, meeting annually. An administrative committee, including one or more official representatives from each of the denominations, meets monthly in New York City. This committee includes cooperative agencies carrying on specialized work for the churches, among them being the Home Missions Council, the Council of Women for Home Missions, the Council of Church Boards of Education, the American Bible Society, the Student Volunteer Movement for Foreign Missions, and the International Council of Religious Education. The council also serves as a connecting link between the church and great social agencies, such as the American Red Cross, child-welfare organizations and the U. S. Bureau of Public Health.

Special tasks of the council are carried on by a group of commissions. The commission on evangelism develops a united approach to the evangelistic work of the churches. The commission on the church and social service is the centre through which the churches deal unitedly with

social issues, giving particular attention to the developing of better relations in industry. The department of research and education issues a weekly information service bulletin in which contemporary social questions are discussed from the standpoint of Christianity, it also makes special studies from time to time, the outstanding ones in 1929 being a report on the textile situation in a group of Southern mills and a handbook of rural social resources. The commission on church and race relations furthers efforts of the churches in promoting cooperation and good will between the white and colored peoples in the United States. The commission on international justice and good will endeavors to mobilize the Christian forces to abolish war by building up effective international agencies for cooperation, devoting its attention during 1929 to such questions as the reduction of naval armaments and support of the Permanent Court of International Justice. Other commissions of the council deal with Christian education, relations with religious bodies in Europe, religious work in the Canal Zone, Army and Navy chaplains, relations with the Eastern churches. The Church and Drama Association was organized in 1927 for uniting all religious forces in support of the worthiest productions on stage and screen.

The programme of the council is carried on with funds contributed in part by individuals interested in the work and in part by appropriations from the various denominations. The official organ of the council is the *Federal Council Bulletin*, issued monthly and furnishing general religious news. The officers in 1929 were President, the Rev. Francis J. McConnell, Methodist Episcopal bishop of the New York City area, chairman of the executive committee, the Rev. Walter L. Langie, president of Davidson College, chairman of the Washington committee, the Rev. William F. McDowell, Methodist Episcopal bishop of the Washington area, chairman of the Western committee, the Rev. Herbert L. Willett. National offices are at 105 East Twenty-second Street, New York City, the general secretaries being the Rev. Charles S. Macfarland, the Rev. John M. Moore, and the Rev. Samuel McCrea Calvert. Offices also are maintained in the Woodward Building, Washington, and at 77 West Washington Street, Chicago.

**FEDERAL RESERVE BANKS.** See BANKS AND BANKING, also FINANCIAL REVIEW.

**FEDERATED MALAY STATES.** A group of states, constituting a large part of the Malay Peninsula, under the protection of Great Britain, comprising Perak, with an area of 7800 square miles, population in 1921, 590,063; capital, Taiping, Selangor, 3156 square miles, population, 1921, 401,009, capital, Kuala Lumpur, the largest city in the federation with a population of 80,000, Negri Sembilan, 2550 square miles, population, 1921, 178,762, capital, Seremban, Pahang, 14,000 square miles, population, 1921, 140,004, capital, Kuala Lipis. The total area is 27,506 square miles, the population in 1921 was 1,324,890, including 510,821 Malays, 494,548 Chinese, 305,219 natives of India, 5686 Europeans, and 3204 Eurasians. The males greatly outnumber the females (853,528 to 471,362), due to the large number of Chinese and Indian immigrants. The estimated population in

1928 was 1,533,611. During 1924-28 births averaged 44,389 and deaths, 39,089, annually. In 1927 there were 47 English schools, with an enrollment of 12,369 boys and 3332 girls. There were 1132 schools under the control of the educational department numbered 1132, with an average enrollment of 61,131. There are many vernacular schools for the Chinese not maintained by the Government.

**PRODUCTION.** Rice, coconuts, rubber, sugar, tapioca, pepper, gambier, and nipa palms are the chief products. The main industries are the raising of rubber and the mining of tin. In addition to valuable timber, the forests produce resins, canes, gutta-percha, etc. Besides tin, gold and coal are mined extensively, other minerals found but not worked in quantities are lead, iron, copper, manganese, silver, zinc, plumbago, mercury, arsenic, and scheelite. Coal production totaled 520,705 tons in 1928, tin and tin ore, 61,861,898 tons. The labor force engaged in mining at the end of 1927 was 122,888. The imports in 1927 totaled £20,300,979 and the exports £39,619,922. The chief imports were rice, opium, tobacco, cigars, cigarettes, cotton piece goods, petroleum, machinery, wheat flour, condensed milk, and sugar. The chief exports, rubber, copra, tin, timber, and hides. In 1928 net rubber exports totaled slightly under 300,000 tons. Advance estimates placed the 1929 production at between 300,000 and 350,000 long tons.

**FINANCE.** Revenues of the Federated Malay States have been well in excess of expenditures for some years, the revenues for 1927 totaling £12,297,187 (£11,963,163 in 1926) and the expenditures, £10,880,790 (£10,227,437 in 1926). Export duties on rubber and the opium excise taxes are the chief sources of revenue. The Government has contributed £2,000,000 toward the naval base at Singapore, payable in five annual installments. The public debt on Jan. 1, 1928, was £9,355,000.

**COMMUNICATIONS.** The railway system, which is government owned, embraces 1036 route miles, mostly single track. Due to intensive motor competition, the net earnings for 1928 dropped to £302,366, as compared with £420,701 in 1927. Freight receipts increased 171 per cent because of heavy rubber shipments, but passenger receipts dropped 149 per cent. In 1927 there were 2600 miles of metalled cart roads and 113 miles of unmetalled roads. In the same year, there were 2602 miles of telegraph and telephone lines.

**GOVERNMENT.** The states are under British protection and the British Government is represented by the Governor of the Straits Settlements, who is ex officio High Commissioner for the Federated Malay States. There is a native ruler, assisted by a British Resident, in each of the four states. High Commissioner in 1929, Sir Hugh Charles Clifford.

**FEDERATION OF LABOR, AMERICAN.** See LABOR, AMERICAN. FEDERATION OF.

**FENCING.** The splendid work of Frank S. Righenmer, Jr., a Yale University star and a member of the Fencers Club of New York City, was the feature of the 1929 season. Righenmer captured both the indoor and outdoor national *épée* crowns with comparative ease, and also won third place in the national foil class, behind Joe Levin who captured both foil honors, and Lieutenant George C. Calnan, U. S. N., former titleholder, Leo Nunes,

New York Athletic Club, gained the national sabre title, with Cohn, second and John R. Huffman, third. Cohn, however, took the outdoor championship at Trevers Island, N. Y.

Mrs. Leon M. Schoonmaker of the Fencers Club won the national women's foils championship, while she and Miss Lloyd were also members of the leading international foil team Mrs. Harold Van Buskirk gained the national junior foil championship.

The Yale University fencers again gained the intercollegiate title, winning the team crown for the third successive year. R. G. Mer was the star of the Eli squad, capturing victories in the foils and sabres events, and thus making intercollegiate history. The Navy and Army teams finished in that order behind the Yale swordsmen. Chicago University gained the laurels in the Western Conference competition at Chicago, nosing out Wisconsin by a narrow margin.

**FERTILIZERS.** The fertilizer industry made use of the rapid developments in the production of fixed nitrogen compounds and of concentrated fertilizers, thus benefiting agriculture by making available cheaper and more satisfactory sources of plant-food materials. This was reflected in the constantly increasing use of inorganic fertilizer materials, the tendency to eliminate low-grade fertilizers, and the increased use of synthetic fertilizer salts. Salts containing two and even three elements of plant food and representing concentrations as high as 85 per cent were developed as substitutes for salts containing only one plant-food element. The fitness of these materials both for the fertilizer trade and in the field was demonstrated. As a result, fertilizer mixtures containing as high as 60 per cent plant food are now being marketed successfully at a lower price and a greater profit.

*The Report of the Secretary of Agriculture, 1920*, states that the new nitrogen materials are characterized by high plant-food concentration, urea, for example, containing 46 per cent nitrogen, having been demonstrated to be a valuable nitrogen fertilizer of ready availability to plants. New compounds of phosphorus, such as double superphosphate containing 43 to 46 per cent of available phosphoric acid, were developed. Potash salts of high potash content also were available as fertilizers.

The direct treatment of potash or phosphate bearing raw materials with nitric oxide, for the production of materials containing two or more essential plant foods, also showed considerable promise. A number of both potassic and phosphatic materials were found suitable for this direct treatment. Treating a concentrated solution, obtained by passing water and nitric oxides in a counter current manner over phosphate rock, with the basic materials, accelerated the fixation of nitrogen oxides from ammonia oxidation as nitrates and the liberation of fertilizer elements in an available form.

Fertilizer consumption in the United States was estimated at approximately 8,000,000 short tons during 1920. This was considerably below the potential productive capacity of the factories, which was reported to be in the neighborhood of 12,000,000 tons of complete fertilizer per year. The United States also was below European countries in the profitable use of fertilizers. According to Director J. G. Lipman of the New Jersey Agricultural Experiment Stations (*Pro-*

*ceedings of the Fifth Annual Convention of the National Fertilizer Association, 1920*, pp. 123-129) the average annual applications of nitrogen, phosphoric acid, and potash in round numbers per acre reached 50 pounds in Germany, 20 pounds in France, 16 pounds in Great Britain, and 99 pounds in Holland; whereas in the United States they averaged only 5 pounds. This means that about three times as much plant food per acre was used in Great Britain, about four times as much in France, ten times as much in Germany, and nearly twenty times as much in Holland as in the United States. The annual removals of plant food from the soil per acre by crops and leaching in the United States were estimated roughly to be equivalent to 30 pounds each of nitrogen and potash, and 12 pounds of phosphoric acid. Thus the farmers of the United States are replacing only 3 per cent of the nitrogen, 25 per cent of the phosphoric acid, and 33 per cent of the potash removed annually from the soil by crops.

The latest available figures indicated a considerable increase in quantity and value of exports and a decided decrease in imports of fertilizers and materials by the United States during 1920, as compared with the previous year, the differences in quantities amounting to somewhat over 200,000 long tons in both instances. Exports of rock phosphate increased considerably, but exports of superphosphates showed a slight decrease. Imports of phosphates showed a marked decrease. Imports of nitrogenous fertilizers showed a decided decrease of over 100,000 long tons. Imports of both nitrate of soda and sulphate of ammonia decreased. There was a decided increase in imports of synthetic nitrogen compounds and like products. Exports of sulphate of ammonia increased considerably. Imports of potash fertilizers decreased decidedly. There was a slight increase in exports of fertilizer mixtures and other fertilizers.

All but about 320,000 out of several million tons of nitrogen going annually into the soils of the United States is produced as manure, by bacterial fixation or is carried down in rain. The necessary auxiliary supply now comes mainly from Chilean nitrate, by-product sulphate of ammonia, cyanamid, and other fixation products. The annual inorganic nitrogen supply of the United States totals about 400,000 tons of pure nitrogen. This amount varies from year to year, the tendency being toward steady growth in coke-oven production and more rapid growth in air-fixation output. The United States was still dependent in large measure upon imports for its nitrogen supply. Agriculture was by far the largest user of nitrogen and led also in the variety of forms used.

The growth in the world's fixed-nitrogen industry was marked. This advance has been made mainly under private auspices and initiative. The Italian nitrogen industry is now in a position to fix 67,500 metric tons of nitrogen annually, of which 44,000 tons are produced by the synthetic ammonia process, 20,000 in the form of calcium cyanamid, and 3500 as by-product ammonia. The bulk of the ammonium sulphate consumed in Italy is supplied by the domestic synthetic ammonia industry. The growth of the fixed nitrogen industry in Great Britain, especially of the synthetic ammonia process, has lowered the prices of all nitrogenous fertilizers. The contributions of Germany to the world's supply of nitro-

enous fertilizers are almost entirely of synthetic origin and include among other products, potassium nitrate manufactured by a new process. Shipments of ammonium sulphate during the first 9 months of 1929 from Germany to all countries amounted to 528,933 metric tons. It appears that synthetic nitrogen is now second only to Chilean sodium nitrate in its influence on the world's nitrogen supply. During the year, for the first time, nitrogen fixed within the United States became an important part of the total supply and for the first time domestic production went directly into fertilizer.

The phosphate industry was well stabilized during the year on the basis of well-known practical methods, and new methods were being developed and put into use which will have a direct bearing upon the concentrated fertilizer industry. A continuation of the study of fluorine compounds as by-products of the phosphate industry indicated that a general recovery of the fluorine in the manufacture of superphosphates would result in the production of compounds having a direct value of \$3,000,000 annually. Study was continued on cheaper methods of producing liquid phosphoric acid from phosphates, and tests of the reduction of phosphate rock in the blast furnace gave added evidence of the feasibility of this process. Discovery and exploitation of phosphate deposits in different parts of the world were reported. Notable among these was the opening up of the new deposits in former German South West Africa by a German concern.

The development of new sources of potash in different parts of the world continued. Notable among these is the Solikamsk deposit in Russia, estimated at about 500,000,000 tons of crude materials. American production increased, however, while rapid progress is being made in establishing an American potash industry, the United States exports annually \$18,000,000 for potash imported from Europe, mainly from German and French sources, according to the *Report of the Chief of the Bureau of Chemistry and Soils* for 1929. According to the latest available figures, about three-fourths of the world's output of potash (nearly two and a quarter million metric tons of  $K_2O$ ) is produced in Germany.

The exports of fertilizer materials from the United States during 1927 to 1,535,000 long tons, valued at \$1,534,723, were more than one fourth greater than the 1928 tonnage and only 4000 tons less than in 1913, the year of maximum exports. The accompanying table shows the trend of the United States export trade in fertilizer materials during the year 1927-29.

UNITED STATES EXPORTS OF FERTILIZER MATERIALS

Commodity	1927	Long tons	1928
Ammonium sulphate	138,682	93,015	145,189
Other nitrogenous materials	8,951	7,772	24,558
High grade phosphate rock	128,774	89,702	67,474
Land pebble and other phosphorous rock	789,437	809,062	1,075,272
Superphosphates	107,507	88,613	85,118
Mixed and other fertilizers	97,682	130,674	137,312
Total	1,271,043	1,218,838	1,534,723

Japan was the principal buyer of ammonium sulphate, taking 60,000 tons, or 41 per cent, of the total, followed by the Netherlands East In-

dies, with 37,000 tons, the Philippines with 30,000 tons, and Cuba with 10,000 tons. Shipments of other nitrogenous materials reached 24,000 tons, with exports to Canada, Germany, the Philippines, and Japan doubled, the total sales to these four countries attaining nearly four-fifths of the entire foreign sales. Mexico, Cuba, and the Netherlands East Indies also were purchasers.

**BIBLIOGRAPHY.** Sources of information regarding progress in the production and use of fertilizers are numerous. Attention is drawn especially to the following: Current progress in the fertilizer industry is recorded in *The Fertilizer Review*, published by the National Fertilizer Association at Washington, D. C. Statistics of the fertilizer trade and industry will be found in reports of the Bureau of Foreign and Domestic Commerce, especially in the weekly *Commerce Reports*, and of the Census Bureau of the Department of Commerce. A publication of special interest was "New Fertilizer Materials and Their Uses," by J. J. Skinner (North Carolina Experiment Station Circular 22). Recent books of interest are *Handbook of Fertilizers* by A. F. Gustafson (New York and London, 1928), and *A Bibliography on Concentrated Fertilizers and Fertilizer Materials*, by W. H. Ross (Washington, D. C., 1928).

**FIELDING, WILLIAM STEVENS.** A Canadian statesman who died June 23, 1929, and was born in Halifax, Nova Scotia, Nov. 21, 1848. He was educated in the public schools of Halifax and in 1864 became a reporter on the Halifax *Morning Chronicle*, of which he was later managing editor. He resigned this position to represent Halifax in the Provincial Legislature, 1882-96. He was provincial Prime Minister, 1884-96, resigning to become Minister of Finance in the cabinet of Sir Wilfrid Laurier. He held the portfolio of Minister of Finance, 1896-1911, and again, 1921-25, and during these years secured the enactment of tariff regulations favorable to Canadian trade. He represented Canada at the Colonial Conference in London, 1902. He was one of the British plenipotentiaries for the negotiation of the Franco-Canadian Commercial Treaty in Paris (1907), the Supplementary Treaty (1902), the Franco-Canadian Commercial Treaty (1922), and the Italian Canadian Treaty, London (1922). He effected commercial arrangements with Germany, the United States, Italy, and Belgium, 1909-10, and with Japan, 1911. He was a member of the British Royal Commission on Canada-West India (1909-10) and one of the Canadian commissioners who negotiated the Reciprocity Agreement with the United States in 1911. He was one of Canada's representatives to the League of Nations at Geneva, 1922.

**FIJI ISLANDS.** A British Crown colony, comprising a group of islands in the South Pacific about 250 in number (some 80 inhabited). Area 7083 square miles, population at the census of 1921, 157,260, of whom there were 84,475 Fijians, 60,634 Indians, and 3878 Eu-

Europeans. The estimated population Jan. 1, 1928, was 173,836, including 4480 Europeans, 90,263 Fijians, and 69,463 Indians. The largest island is Viti Levu (4053 square miles) and the next, Vanua Levu (2130 square miles). The capital, Suva, on the south coast of Viti Levu, had a European population (including suburbs) of 1741 in 1921. Coconuts, sugar cane, rice, tobacco, maize, tropical fruits, and cotton are the principal products. Horses, mules, cattle, sheep, goats, and pigs are raised. In 1927 exports were valued at £1,997,374 and the imports, at £1,223,303. The revenue in 1927 was £586,574, expenditure, £534,939, public debt, £153,550. The total tonnage which entered and cleared in 1927 was 1,278,757 tons. A privately owned small-gauge railway runs 120 miles from Tavua to Sigatoka. The executive power is vested in a governor, appointed by the Crown, aided by an executive council and a legislative council of which the governor is president. The governor is also high commissioner for the Western Pacific. Governor in 1929, Sir Eyre Hutson, appointed 1925.

**FINANCES** See PUBLIC FINANCE, U. S.

**FINANCIAL REVIEW.** BUSINESS in the United States during the year 1929 passed through two distinct periods. The first was characterized by very great activity and lasted until about midsummer, or a little later, in most industries. It was then followed by decided recession, one feature of which was the outbreak of a severe financial panic during the latter part of the month of October. The primary phenomena of the panic then continued throughout November and December and their reflex effect on business was almost immediately visible in a further reduction of activity and of employment. Simultaneously, new financing sank to almost nothing, and enjoyed only a very slow recovery. Rates of interest and discount had been exceedingly high, prior to the October panic, but, with the lessening of brokers' loans and the reduction of financial activity, a very great lowering of rates occurred in the open money market although there was no saving in the actual cost of capital to the ordinary business enterprise. Public speculative buying, which had been attaining wholly unexampled proportions prior to the panic, was followed by a sharp fall after the recession by heavy selling in the market of the stock exchange being of a size and activity never before approached. This was later followed by a reaction to subnormal conditions.

**STOCK EXCHANGE OPERATIONS.** The actual volume of operations on the exchange reached a figure close to 1,125,000,000 shares for the year, as compared with the previously unknown level of 920,000,000 shares in 1928 which itself was greatly in excess of the 577,000,000 shares of 1927. The total volume of bonds traded in which as well as their prices had a little off during the stock movement) was a little over \$3,020,000,000, as against \$2,939,000,000 the year before. The extraordinary breadth of trading in stocks produced a series of remarkable days during October and November on one of which (October 29) the volume of transfers was 10,400,000 shares, while there was not a single day on which less than a total of 1,000,000 shares was transferred. The exchange reported that there were 122 days which exceeded 4,000,000 each and 37 which exceeded 5,000,000, the tremendous buying followed by the even more tremendous selling after the panic kept the staffs of brokerage

houses feverishly employed, while, before the breakdown, the highest seats had sold as high as \$625,000. They did not enter the break to little more than half that figure.

This recession, although most striking from and after October 23, when the market took place, did not come on as suddenly as many persons were inclined to believe. For six or eight months prior to the break, there had been a decided tendency on the part of various groups of issues to fall into a quiescent condition and to tend either to become stabilized or actually receded in normal circumstances, the effect of such a tendency would have been to bring about a decided reaction throughout the whole list, but on this occasion, the situation merely caused the greater concentration of trading in a comparatively small group of some 50 or 60 favorite shares in which nearly all of the business came to be massed, and in which the turnover was tremendously heavy, at times highly abnormal. The advances in price which were scored by this small list of stocks were, however, sufficient to offset the sections of the list which were either stable or reactionary, so that an index of 50 representative shares showed at the high point of the year a combined average of 311.90 for the week ending September 21, as compared with a low of 192.00 at the end of the week closing December 28 and 218.26 a year earlier, while a similar index of 40 representative bonds showed a quotation of 93.60 at high point in May, as compared with 80.24 during August, just before the panic had taken effect and had tended to drive funds out of the stock market and into bonds.

Notwithstanding that a great many financial authorities at the coming on of a breakdown, it had been impossible to shake the confidence of the average investor in securities and there had been a pretty general acceptance of the view that a new era in security investment had opened, during which it would be possible to ignore many of the warnings and symptoms which in former years had been regarded as decisive. It is probable that a primary degree of responsibility in this matter must be allotted to the banks which continued to furnish an almost unlimited amount of lending power. The total of loans on securities made by all banks just before the panic was probably in the neighborhood of \$18,000,000,000 or more, estimating the total for all banks of the United States, while partly included in this total were about \$8,500,000,000 of brokers' loans, as reported by the New York Stock Exchange.

It had been impossible to convince the banks of the country at large that they were not satisfactorily protected by the 50 per cent margins, which, in many cases, they had exacted, and there were few persons who were willing to admit that a positive shrinkage of one-half could possibly take place in the general average of the securities list. This great confidence was partly supported by genuine prosperity in industry, including the development of a much higher degree of efficiency and a much larger output of goods per man than in former years, but it was also promoted by the same stock-jobbing methods that had been employed in 1928—the splitting-up of shares so as to issue a much greater number in exchange for those previously held, the declaration of stock dividends on a large scale, the actual payment of regular dividends in stock, and manipulation

designed to bring about artificial advances or to "peg" securities already issued at specified prices.

It is probable that even these manipulative methods would not have been in any degree as successful had it not been for the fact that, in addition to the maintenance of a fairly strong base of underlying business, with substantial prosperity on the part of numerous branches, foreigners, including many who had heavily borrowed in the United States during recent years, were induced to enter the speculative field and so to return to this market for the purchase of securities a great deal of money with which they could not very well afford to part.

It was almost inevitable that as a result of the general speculative mania and the real prosperity that existed here and there, there should have been considerable overproduction in certain directions. Thus, for example, the automobile trade which had been realizing large profits, became tremendously overproduced, so that at the end of the year a surplus of new cars said to be more than 500,000 was on hand, while enormous numbers of used cars were also seeking sale. In the oil industry, where overproduction had threatened for a number of years, conditions steadily became worse during the forepart of 1929, with the result that production control methods were introduced and began gradually to take effect during the latter part of the twelve months. This, however, did not prevent the development of a very large surplus stock in excess of what had prevailed the year before, while during the later weeks of the year, the stock of gasoline on hand also greatly exceeded consumption.

In copper, where rigid methods of control of production had been applied about a year before, prices were forced up to 24 cents a pound at the beginning of April, then fell back to 18 cents, at which point they were "stabilized" during the remainder of the year, but only at the cost of a very great increase in the stock of unused copper which was more than double (for the refined product) at the end of the year, what it was at the beginning. Copper shares, which had had a tremendous advance before the panic, lost very severely, dropping in many cases to little more than 50 per cent of their original prices.

The outstanding feature of the public utility market during 1929 was the continuation of the merger movement which carried further the process of reorganizing the industry that was already begun the year before and incidentally resulted in tremendous inflation of values, as compared with earnings or dividends, or even prospects of future success.

NEW ISSUES. New issues during 1929 were

were immensely overissued, and assumed a distinct place as a speculative element in the market. Industrial stocks increased during the year, as compared with the preceding year, when they were already very high, by 10 to 12 per cent, financial stocks, by well toward 100 per cent, while there was a reduction of marked character in the issuance of public utility shares. Bond issues declined in practically all branches of business, although there was an increase in the State and municipal field.

According to the compilations of the *Journal of Commerce* (New York), the new and refunding issues of 1929 classified by type of issue and compared with those for 1928 are as indicated in the accompanying tabulation.

SUMMARY OF NEW FINANCING  
[From *Journal of Commerce*, New York]

	1929	1928

Total	\$8,072,986,042	\$681,846,656	\$8,754,832,698

heavily, so far as stocks were concerned, but showed a great falling off in the foreign field. Particular expansion occurred in the field of investment trusts and other financial stocks which

MOVEMENT OF GOLD. During 1929 the movement of gold into the United States which had vigorously set in at the close of the preceding year, was maintained up to the close of October

with the result that about \$250,000,000 was imported (net). The movement then turned, and about \$112,000,000 was exported during the remainder of the year. This change was due directly to the alterations which attended the panic of October and was attended by a very great change in the movement of international trade. The Federal Reserve statement for the year showed a decided gain of gold over the year 1928, but comparative figures for different dates during 1929 indicated steady loss of this gold, so that at the end of the year the actual increase was not more than \$300,000,000.

Especially noteworthy were the redistributions of gold among Federal Reserve banks, the Reserve Bank of New York losing during the autumn about \$300,000,000. The influx of gold during the first 10 months of the year was primarily due, it would seem, to the heavy purchase of

full gold redemption of her currency and thus tended to lose gold somewhat. See JAPAN, under Finance, for announcement of proposed lifting of gold embargo on Jan 11, 1930.

Movements of gold between the United States and other countries remained about normal while the flow of silver to the Eastern countries continued on a large scale, the rapid decline in the value of silver (measured in gold) during the latter part of the year, tending to make it profitable to ship actual bullion in settlement of debts. Federal Reserve banks continued the practice of earmarking gold for the purpose of avoiding actual shipments but the utility of this particular method of dealing with the matter was less and less favorably viewed and lost the prestige that it had appeared likely to have. A survey of the movement of gold is furnished in the accompanying table.

## ANALYSIS OF CHANGES IN MONETARY GOLD STOCK

(From Federal Reserve Bulletin)

[End-of-month basis In millions of dollars]

Month	Gold stock at end of month	Increase (+) or decrease (-) during month			
		Total	Through net gold import or export	Through foreign operations	Through domestic production, etc.
1927—November	4,451	- 89.7	- 53.2	- 40.0	+ 3.5

December	4,284	- 82.3	- 64.4	- 22.0	+ 4.1
Total (12 mos.)		+142.4	+175.1	- 55.4	+22.7

\* For detailed explanation of this figure, which is derived from preceding columns, see Federal Reserve Bulletin for December, 1928, p. 831.

securities which had been made in the United States by foreign speculative investors attracted by the stock-exchange movement, while the outflow of gold in the latter part of the year was fundamentally dictated by the withdrawal of capital on the part of foreigners.

Other elements which tended to work in the same direction were the reduction of the export balance of the United States during the latter part of the year, while during the forepart heavy claims upon foreign countries had continued to accumulate as a result of tremendous sales of goods abroad. Among those who drew most heavily on the United States for gold, the Bank of France continued to be the outstanding element, while Argentina, which had taken gold during the year before, now lost it to the United States and was eventually obliged to suspend payments in gold. Japan, on the other hand, resumed the

INTERNATIONAL BALANCE. Export business went ahead rapidly during 1929, especially during the forepart of the twelve months, but the same causes which were working toward the breakdown of the financial structure, and among them particularly, the fact that the high interest rates at home had practically cut off foreign borrowing in the United States, and had thereby prevented Americans from financing the foreigners' purchases, were working powerfully against the further development of American business. As a result, the months of October, November, and December showed great reductions in business, and although for the year we exported merchandise worth \$5,248,000,000, an increase of \$120,000,000 over the preceding year, and imported only \$4,400,000,000, leaving a net balance of \$848,000,000 in our favor, the last three months of the year had shown decided shrinkage, not merely as

## FOREIGN TRADE OF THE UNITED STATES, 1929

1929	Merchandise			Gold			Silver

compared with the earlier months of 1929, but also as compared with the corresponding months of a year earlier. In the accompanying table, showing the balance of international payments computed in 1929, for the year 1928, is furnished the background for these changes during the 12 months of 1929. The following figures also supply a survey of the export-import situation of the year 1929.

**COMMODITY PRICES.** The comparative stability of prices which had been noticeable during the years 1927 and 1928, continued during the year 1929, although with a tendency to recession toward the end of the year. This apparent stabil-

ity was viewed by the more conservative observers of the situation as being due to the general credit inflation which prevented the decline of prices that would otherwise probably have followed upon the great increase in the output of consumption goods which had been rendered feasible as a result of the steady increase in industrial efficiency during the previous few years. Still there was a good deal of fluctuation in individual commodities.

The prices of agricultural products were affected in a rather important degree by two factors—throughout the second half of the year by the policy of the Farm Relief Board, which had

<sup>a</sup> Largely a deduction from American tourist expenditures.

<sup>b</sup> Issued outside our balance-of-payments area. Usually American statistics of public offerings include those of all Territories and possessions, although Hawaii, Porto Rico, and Alaska are parts of our customs area.

<sup>c</sup> One of four important items whose amounts are extremely uncertain. It is supposable that most of the net discrepancy in the entire statement (arising from errors and omissions) results from errors in this group of items. Accordingly, the original estimates of these items were all altered according to a uniform ratio which would eliminate 60 per cent of the net discrepancy in the entire statement. Before the items were thus altered, the net discrepancies for the years 1927 and 1928 were respectively +118 and +101.

<sup>d</sup> Estimated net export of long-term private capital.

<sup>e</sup> Discrepancy, due to net errors and omissions. Total errors and omissions would probably be much greater, since they tend to offset one another.

been organized in July, and during the last quarter of the year, by the reflex effects of the panic and business recession, which exerted a powerful effect in many directions, and offset the earlier - and later - Farm Board effort. Wheat (No. 2 Red) was reported at the close of 1929 as bringing approximately \$1.46½ in Chicago, as compared with \$1.54¼ a year earlier. Cotton was more stable, but showed a generally lower tendency at the close of the year than 12 months earlier. At the opening of the year 1929, Midling Upland Cotton had brought approximately 20.55 cents, while at the close of the year the price was 17.30 cents. Controversy about the cotton situation and the method of fixing prices in New York, continued active throughout the year, and resulted in various investigations some of which had not as yet been completed at the close of the year. These, however, had produced no distinct consequences, and no changes in the general situation of business. Unsatisfactory prices for meats continued to be realized.

Family beef, which had been \$30 to \$31 at the beginning of 1929, was quoted at \$27 to \$29 at the close, and mess pork, which had been \$30 to

\$31, at the beginning of 1929, was \$26.50 at the close. The general outlook in other agricultural products, however, was more favorable. In various branches of the commodity field, price control had, however, gained a strong footing. Copper, for example, was held firmly at 18 cents or higher (once rising to 24 cents). Restriction of the production of oil led to a kind of incomplete price control. On the other hand, rubber, which had previously been subject to the effects of the restriction policy of foreign countries, enjoyed for the first time a really free market, and fell as low as 15 to 16 cents toward the end of the year, although in earlier months not far from 20 cents.

In spite of all these changes, the index of wholesale prices, was not much altered, standing in January at 97.2, and in November at 94.4, while in December it was 94.2.

**FOREIGN EXCHANGE.** General conditions in foreign exchange showed continuation of the more satisfactory position which had been assumed by most currencies, during the preceding year. Striking alterations, except in a very few cases, were accordingly absent. The most important

episodes of the year, affecting the value of foreign currencies, were the suspension of gold export and gold conversion in Argentina and the resumption of free gold exports in Japan. Relations between Great Britain and the United States were somewhat affected by the flow of foreign capital into the New York market prior to the panic, and the sharp return which succeeded the panic. Exchanges, however, on the whole, followed the New York rates of sterling. The further withdrawal of gold by France did not produce any very great results, but the franc continued tolerably closely pegged. Canadian dollars showed great weakness during the year, due to the belief of many that official obstacles were placed in the way of gold exports. Sharp fluctuations in pesos occurred, largely due to lack of confidence in the Spanish government policy, while the disturbance of coffee prices in Brazil unsettled the milreis quite seriously. At the close of the year there was nothing of great significance in sight, as a factor tending to change the exchange situation, except the possible policies of the new International Bank. The accompanying table sets forth the changes in several of the more important currencies, the first week in each month being selected as the basis of comparison.

**MONEY RATES.** Money rates underwent revolutionary changes during 1929. At the opening of the year money was scarce and high, and this condition was rendered worse by the policy of the Federal Reserve System in attempting to withdraw credit, followed by an advance in its rate to 6 per cent in August. Call money fluctuated at high levels, being frequently 10 per cent during the spring and summer. The Federal Reserve Board, which had previously adopted an attitude of comparative indifference on the whole subject began to show alarm early in the year, and issued a series of warnings, to the banks, not to allow their credit to become involved in speculation.

The outgrowth of this state of things was a tendency on the part of city banks to reduce commitments and place themselves in a better protected situation, but country banks were not able to do anything of the kind, and it is probable that the warnings of the Reserve Board and of the Reserve banks frightened the ordinary banker instead of inciting more caution and wise handling of the general situation. At all events, no success was obtained in reducing the volume of outstanding bank credit, and brokers' loans continued to climb.

The panic which came on in the latter part of October led to great liquidation of brokers' loans, and in order to alleviate the state of things, the Reserve Bank of New York, cut its rates first to

5 1/2 and later to 4 1/2 per cent. Call money fell to 4 per cent in open market. At the close of the year, Secretary of the Treasury Mellon made a reassuring review of the credit situation and summarized conditions as follows:

"A review of the policy of the Federal Reserve Board during the past year shows that it has endeavored to guard against an undue extension of credit through speculative channels and to conserve the country's credit resources for the purpose of meeting future requirements of industry and trade. The gold that came into the country during the year ending June 30, 1929, was not added to member bank reserves and did not constitute the basis of expansion of the country's credit structure, but was used to liquidate reserve bank credit. Chiefly as a result of the inflow of gold, total reserves of all reserve banks increased by more than \$300,000,000 during the year. Since the banks' total note and deposit liabilities showed relatively little growth, the reserve ratio for all banks combined increased from 68 per cent to 74 1/2 per cent and the volume of reserves in excess of legal requirements increased by about \$300,000,000. At the end of the period, therefore, the reserve banks were in a stronger position than a year earlier, and were better prepared to meet any emergency demands that might arise, as well as to provide the basis for meeting the increase in the country's credit requirements growing out of year-to-year growth in the volume of industrial, commercial, and financial activity.

These reassuring words were not altogether accepted by the public as indicating a wholly satisfactory condition, particularly when it was

noted that the liquidation of brokers' loans had merely resulted in transferring a considerable proportion of them to the banks, so that at the close of the year the banks were loaning as much on securities as they had been just before the panic. The only real reduction of outstanding credit had taken place in the item of loans for the account of "others," which was probably reduced by \$2,000,000,000 gross. Toward the end of the year, the Federal Reserve banks also adopted a very free acceptance buying policy, at rates around 4 per cent as a result of which they speedily came to hold for account at themselves and of foreign banks about \$1,000,000,000, out of a total of \$1,750,000,000, a record high figure for acceptances issued in the United States. See **BANKS AND BANKING.**

In the investment field the tendency to a better yield on bonds and preferred stocks continued to maintain itself pretty well throughout the year, and tended more and more strongly to give to the holder of fixed-rate securities, a more satisfactory position. This relationship was somewhat changed after the panic on account of the decline in the quotation of common stocks, but by the end of the year, confidence had not yet been sufficiently restored to induce preferred stockholders or bond holders to part with their holdings, and to enter the common-stock field in much larger numbers. See also **BUSINESS REVIEW, PUBLIC FINANCE.**

**FINE ARTS.** See PAINTING; SCULPTURE, ART EXHIBITIONS, ART MUSEUMS, ART SALES.

**FINLAND.** An independent republic of Europe, bounded on the east by Russia, on the north by the Arctic Ocean and Norway, on the west by Sweden and the Gulf of Bothnia, and on the south by the Gulf of Finland. Formerly a grand duchy of the Russian Empire, it was declared independent Dec. 6, 1917, and became a republic under the constitutional law of July 17, 1919. Capital, Helsinki.

**AREA AND POPULATION.** The total area exclusive of water is 132,608 square miles, population, according to the census of 1920, 3,364,807; estimated Dec. 31, 1927, 3,582,000. In 1927 the rural population was 2,962,000. The movement of population in 1927 was Births, 75,611; deaths, 51,727, marriages, 24,200, emigration, 6088. The principal towns with their populations in 1927 were Helsinki, 221,000, Abo, 63,000, Tampere, 53,000, and Viborg, 50,000. The Evangelical Lutheran religion is that of the bulk of the population, but freedom of worship is granted to all.

**EDUCATION.** Primary instruction is free and compulsory between the ages of 7 and 15. For elementary education in 1927, there were in the country 4670 elementary schools with 219,053 pupils, 3081 lower elementary schools, with 70,292 pupils, and 867 infant schools under the superintendence of the church with 96,035 pupils. In the towns, there were 1257 classes of higher elementary schools with 38,261 pupils. For secondary education, there were 119 lyceums, leading to university, 2363 teachers and 30,302 pupils, 71 middle schools, with 633 teachers and 9562 pupils, eight training colleges for elementary-school teachers, with 112 teachers and 1680 students, 6 training schools for infant-school teachers, and 53 high schools for the people, with 368 teachers and 2838 students. There are three universities—one at Helsinki, with 309 teachers and 4032 students in 1927, and two at Turku, one Swedish, with 46 teachers and 200 students, and one Finnish, with 26 teachers and 290 students. There is also a great variety of agricultural, horticultural, forestry, industrial, and other technical schools.

**PRODUCTION.** Agriculture is the chief occupation of the people, although the area available for cultivation is comparatively small. In 1927, of the total area of Finland, 5,338,000 acres were devoted to crops, 2,953,000 to permanent meadows and pasture, 15,000 to orchard trees and shrubs and bushes, and 76,600 were forests and uncultivated land. Field crops were adversely affected by a cold spring and rainy autumn in 1928, the total value being estimated at about \$108,000,000, as against \$133,000,000 in 1927. The acreage and yield of the principal crops in 1928 were as follows: Wheat, 42,000 acres, 879,000 bushels, rye, 573,000 and 10,940,000, barley, 268,000 and 5,889,000, oats, 1,112,000 and 35,115,000, potatoes, 173,000 and 24,195,000, flax, 14,000 acres, 2,646,000 pounds of fibre, hay (average not available) 2,712,000 metric tons. In 1927 there were 1,871,865 cattle, 417,723 swine, 1,368,173 sheep, 11,021 goats, and 395,968 horses. In the same year, the production of butter was 49,207,000 pounds, and of cheese, 9,235,000 pounds.

The value of all manufactured products in 1928 was 9 per cent higher than in 1927, reaching a new peak of \$340,000,000. In 1927, when

the gross value of production was \$312,001,000, 3780 large manufacturing establishments employed 159,141 workers and 548,217 horse power; the value of the materials used was \$165,794,000. The chief industries, ranking according to the value of output in 1927, were woodworking, paper, food, drink, textile, and machinery manufacturing, shipbuilding, leather, clay and stone working, and light and power production.

Finland's forested area, which is exceeded in Europe only by that of Russia, is one of the chief economic assets. In 1928 Finland was again the largest timber producer in Europe, although a late snowfall, low prices, and a restriction of output, to stabilize the market, resulted in lower production than in the previous year.

**COMMERCE.** Imports in 1928 totaled \$201,900,000 and exports, \$157,300,000, leaving a large import surplus of \$44,600,000, as contrasted with a virtually even balance of trade in 1927, when imports totaled \$100,924,000 and exports, \$159,328,000. The increase in imports was attributed to the reduction of duty rates on coffee, sugar, wheat flour, and other articles of consumption, the poor harvest, and active building operations. Leading imports were machinery, wheat flour, sugar, coffee, rye, wool fabrics, automobiles, iron and steel products, and cotton. The chief exports were lumber and wood products, butter, newsprint, and hides and skins. Imports in 1929 were valued at 6,995,100,000 marks and exports, at 6,426,900,000 marks, leaving an unfavorable balance of 568,200,000 marks (about \$14,205,000).

**FINANCE.** Actual receipts in 1928 amounted to \$114,300,000 and actual expenditures, to \$127,000,000, leaving a deficit for the year of \$12,700,000. Of the revenues, \$92,400,000 was derived from taxation and monopolies, \$14,200,000 from the income tax, and \$34,700,000 from import duties. Chief items of expenditure were: Debt service, \$27,300,000, defence, \$14,200,000, education, \$13,500,000, social service, \$2,500,000. The budget for 1929 estimated receipts at 4,197,000,000 Finnish marks (1 mark equals \$0.0252) and expenditures at 3,501,000,000 marks. The budget for 1930 balanced at 4,595,650,000 marks (\$115,810,000). The public debt on Jan. 1, 1929, totaled 2,640,000,000 Finnish marks, or \$87,400,000, of which \$78,700,000 was external, including \$8,712,000 due the United States Government. The debt increased by \$2,000,000 in 1929. As a result of the economic crisis in Finland during 1928 (attributed to overinvestment of capital in industry, expansion of credit, and high money rates), the balance of 118,000,000 Finnish marks held abroad, by the Finnish commercial banks in 1927, was changed in 1928 to an indebtedness of 245,000,000 marks. The rediscount rate of the Bank of Finland was twice raised in 1928 in an effort to check speculation, reaching 7 per cent on November 15.

**COMMUNICATIONS.** The State Railways of Finland constitute the only important railway system in that country, there being less than 200 miles of private lines. The length of the state railway lines at the end of 1928 totaled 2992 miles, with 4013 miles of track. Gross receipts for 1928 totaled \$22,475,000. For the five-year period, 1926-1930, the Diet passed a scheme of construction, which when completed would cover 840 kilometers of new railways. During 1929, 130 kilometers, or 81 miles, of new line was completed. An extensive chain of lakes, connected with one another and with the Gulf of

Finland by canals, forms one of the principal means of communication. In 1926, 50,787 vessels and 13,318 timber rafts passed along the canals. The merchant marine in 1928 consisted of 354 vessels with a capacity of 280,580 gross tons. In the same year, there were 15,613 miles of highway and (in 1922) 10,162 miles of secondary roads. The telegraph system, which had 3504 miles of line in 1926, and part of the telephone system are state owned. In 1926 the state owned 9966 miles of telephone wire, as compared with 175,693 miles of privately owned wire in 1927.

**GOVERNMENT.** According to the constitutional law of July 17, 1919, Finland is a republic. Executive power is vested in the President elected for six years by the votes of the citizens and in a ministry appointed by him but responsible to the Diet, legislative power, in the Diet consisting of 200 members chosen by direct and proportional representative election, all citizens who have reached the age of 24 possessing the right to vote. The composition of Parliament following the election of July 1-2, 1929, was 60 Agrarians, 59 Social-Democrats, 28 Union party representatives, 23 Communists, 23 Swedish People's party representatives, and 7 Progressives. President of the Republic in 1929, Dr. Lauri Relander, elected Feb. 16, 1925. The Council of State, appointed on Dec. 22, 1928, consisted of Dr. Oskari Mantere, Progressive party, Prime Minister, H. J. Procopé, nonpartisan, Foreign Minister, A. Kotonen, nonpartisan, Justice, T. M. Kivimäki, Interior, A. K. Cajander, Defense, U. Brander, Agriculture, with K. E. Luoma as his Assistant Minister, H. M. J. Relander, nonpartisan, Finance, L. Ingman, Coalition, Education, J. Casten, Coalition, Communication, K. Jarvinen, Coalition, Commerce, and N. A. Mämiö, Social Affairs. The party of nonprogressives only is given.

**HISTORY.** The Mantere ministry which assumed office Dec. 22, 1928, soon found itself in difficulties over its bill to increase the salaries of state employees. The cabinet was defeated on the question by the combined Agrarians and Socialists and Parliament was dissolved April 19 by President Relander. The election held on July 1-2 was marked by the complete defeat of the Mantere ministry and the unexpected gains of the Communists and the newly organized Small Farmers' party. The Mantere cabinet resigned August 3 but remained in office until the formation of the new cabinet, headed by M. K. Kallio, Agrarian, on August 16. H. J. Procopé remained as Foreign Minister, the other members being A. Lantari, Interior, J. Nuukkanen, Defense, T. Reinikka, Finance, A. Kukkonen, Education, M. K. Eklila, Agriculture, M. J. Lahdensuo, Communications, M. P. Heikkinen, Commerce, M. J. Leppala, Social Affairs (temporary). The new ministry, as formulated by the cabinet, includes the stimulation of the economic life of the country, vigilance against Communist and other radical activities, and strict enforcement of the prohibition law.

Prohibition in Finland continued to run much the same course as in the United States. On August 21, it was reported that no less than 18 "rum-running" vessels, most of them German and Estonian, were lying off the Finnish coast. Convictions for violations of the liquor laws from Jan. 1 to Sept. 30, 1929, totaled 7775, as compared with 6153 convictions during the same period in 1928.

The vigorous opposition of the Swedish element of the population to efforts of Finnish Nationalists to weaken their position of linguistic, social, and educational equality in the country continued during 1929 and played a considerable part in the July elections. The Finns outnumber the Swedes nine to one, but Swedish remained the language of public intercourse in Finland until the beginning of the present century. The Swedes were rewarded for their support of the bourgeois parties in the war against the Communists in 1917 and 1918 by having Swedish declared a national language on an equal footing with Finnish in the constitution of 1919. Since then, the Swede-Finns have jealously guarded their prerogatives in and out of Parliament. The two language groups have continually quarreled over place names, inscriptions on railway tickets and trucks, the percentage of Swedish professors in the university, and like matters. Politically, the Swede-Finns have worked in cooperation with the Social Democrats in the past, but in 1929 it appeared that this alignment would be broken up due to a difference of opinion between the two parties over the introduction of German technical experts in connection with the development of extensive timber holdings in Finland by German capital.

A revival of Communist activities late in the year caused the Government to appeal to Parliament for increased authority to suppress Communist propaganda through restrictions on the press and the right to hold meetings. A wave of anti-Communist feeling was reported sweeping the country in December and some fear of the establishment of a Fascist régime was expressed by the Social Democrats.

**FINLAY,** ROBERT HANNATYNE, VISCOUNT OF NAIRN. English jurist, died Mar. 9, 1929, in London. He was born July 11, 1842, the son of an Edinburgh physician. He himself studied medicine, taking his degree at the University of Edinburgh. He turned to law, however, and was called to the bar in 1867. During the years 1885-92 and 1895-06, he was a member of Parliament for Inverness Burghs, solicitor-general (1895-1900), attorney-general (1900-06), member of Parliament from 1901-06, and St. Andrews universities (1906-18). In 1916 he was raised to the peerage as a baron, and in 1919 he was created the first Viscount of Nairn. Lord Finlay was appointed the British member of the Permanent Court of Arbitration at The Hague in 1920, and in 1921 was made a member of the International Court of Justice established by the League of Nations Assembly.

**FIRE INSURANCE.** See **INSURANCE.**  
**FIRE PROTECTION.** The accompanying statistics indicate the continuing menace of the fire hazard throughout the United States, and it was gratifying to record that continued efforts were being made to arouse the authorities and citizens of the larger cities to the seriousness of this danger.

According to the statistics of fire losses in the United States and Canada, compiled by the *Journal of Commerce* (New York), the 1929 total amounted to \$332,426,000 or approximately 10 per cent increase over the \$301,267,560 loss of 1928, which it may be said was the lowest figure reported since 1919. The *Journal of Commerce's* fire loss statistics were based on estimates

of fires involving a loss of \$10,000 or over, with a percentage added to cover small and unreported fire losses. These figures were not so accurate as the statistics computed by the Actuarial Bureau of the National Board of Fire Underwriters, which hitherto had been published later in the year, and usually run about a third smaller. They are of interest as affording a basis of comparison from year to year and also from month to month.

During the year the National Board of Fire Underwriters arranged to secure from its members shortly after the first of each month the total of losses reported during the previous month. These figures when received are combined and a loading added, for losses on insured property and property insured in mutual companies, reciprocals, and in stock companies which are not members of the National Board.

The annual fire losses for the United States, as compiled from monthly statements secured by the National Board of Fire Underwriters from its members, numbering approximately 250 stock companies, of the losses reported to them during the previous month are tabulated herewith. The losses so compiled aggregate for the United States alone about \$80,000,000 more than the losses for the United States and Canada, as compiled from the daily records of *The Journal of Commerce*. The National Board's compilation of fire and lightning losses month by month for 1929 is as follows:

January	\$44,713,825
February	41,520,890
March	41,277,814
April	36,845,795
May	32,129,408
June	33,605,661
July	31,985,493
August	30,446,893
September	29,249,355
October	31,652,385
November	29,061,869
December	39,726,338
Total	\$422,215,128

Classified by States the fire losses for the United States in 1928 are given in the accompanying table from the National Board of Fire Underwriters:

REPORTED FIRE LOSSES—1928 ACTUARIAL BU  
REAU, NATIONAL BOARD OF FIRE UNDER  
WRITERS

Alabama	\$5,018,250	Nebraska	\$3,078,234
Arkansas	5,153,964	Nevada	2,977,329
Arizona	1,250,067	New Hamp	2,309,508
California	19,191,422	New Jersey	14,429,161
Colorado	2,128,957	New Mex	797,241
Connecticut	4,577,505	New York	46,096,581

Mississippi	7,135,013	Wyoming	434,028
Missouri	12,287,782		
Montana	2,451,831		
United States Total			\$371,685,682

## STRICTLY PREVENTABLE CAUSES

	1928	1927
Defective chimneys and flues	\$19,588,878	\$19,523,904
Firecrackers, firecrackers, etc	683,986	893,693
Gas, natural and artificial	2,561,934	3,100,828
Hot ashes and coals, open fires	4,953,769	5,171,491
Ignition of hot greases, tar, wax, asphalt, etc	2,109,299	1,699,208
Lighting	27,902,919	29,545,929
Oil	4,908,768	3,458,701
Petroleum and its products	12,907,297	12,891,718
Rubbish and litter	2,939,182	1,035,454
Sparks on roofs	12,932,552	11,256,303
Steam and hot water pipes	407,319	184,931
Stoves, furnaces, boilers, and their pipes	19,311,169	17,986,432

## PARTLY PREVENTABLE CAUSES

Misuse of electricity	\$14,905,816	\$12,360,558
Explosions	1,147,631	4,725,857
Exposure (including conflagrations)	41,219,494	45,082,747
Sparks from machinery	3,478,454	5,812,406
Incendiarism	2,466,024	2,463,615
Lighting	7,708,530	9,084,630
Unknown causes	3,397,498	3,408,359
Sparks from combustion	4,401,368	4,121,148
Spontaneous combustion	12,112,461	13,640,804

## UNKNOWN CAUSES

Unknown causes (probably largely preventable)	\$170,330,314	\$171,038,429
---	---------------	---------------

An interesting compilation was made during the year of fire losses on American farms classified on the basis of causes for the year 1928 compared with the average for a five-year period. This is indicated in the accompanying table:

## FIRE LOSSES ON AMERICAN FARMS

Causes	1928	5 years 1924-1928
Chimneys, flues, cupolas, and stacks overheated or defective	\$ 5,014,429	\$26,341,759
Fireworks, firecrackers, balloons, etc	20,595	136,696
Gas—natural and artificial	76,182	308,964
Hot ashes and coals—open fires	594,100	3,427,671
Hot greases, oil, tar, wax, asphalt, ignition of	99,971	729,448
Lighting	2,085,882	10,412,246
Oil	120,060	631,161
Petroleum and its products	1,502,097	8,303,502
Rubbish and litter	58,989	240,165
Sparks on roofs	7,246,702	17,218,929
Steam and hot water pipes	3,887	6,594
Stoves, furnaces, boilers and pipes	1,467,566	7,814,804
Electricity	476,948	1,806,341
Explosions	122,212	703,617
Exposure	1,235,996	4,241,816
Friction, sparks occasioned by running machinery	27,501	395,265
Incendiarism	176,012	975,623
Lightning—buildings roddeed and not roddeed	2,967,428	17,727,780
Miscellaneous, cause known but not classified	251,199	1,477,494
Sparks arising from combustion	514,084	1,901,361
Spontaneous combustion	1,285,196	8,670,371
Unknown	12,198,751	65,710,800
Totals	\$43,546,619	\$178,804,409

Important work in the field of fire protection in the United States is carried on by various technical committees of the National Fire Protection Association. These committees are useful in such fields as building construction and restriction of spread of fire in general, fire detection, extinction, and salvage, prevention of fire in general, special hazard processes and occupan-

cies, aviation and marine activities, safety to life and protection of records, and other fields. They are subdivided as occasion warrants and are constantly studying the various conditions and preparing reports which are of advantage to the industries concerned, as well as to fire-protection work in general.

One of the notable developments of the year was the preparation and publication by the city of Boston of the first complete municipal survey of fire hazards and fire defense ever undertaken by an American city and probably by any city in the world. The technical side of this survey, published under the title *A Report on the Problem of Fire Waste and Fire Insurance Rates in the City of Boston*, by the Albert Russel Erskine Bureau of Harvard University, Miller McClintock, Director, was prepared by the field engineering department of the National Fire Protection Association.

This fire-hazard report sought to furnish a comprehensive treatment of the fire problem of Boston, and as similar conditions were prevalent in other American cities the document and the method of its preparation naturally attracted wide attention. The chapter headings, which illustrate the nature of this study, were as follows:

1 What there is to burn in Boston 2 The effect of the building code on structural conditions 3 What is burning in Boston 4 Fires in buildings 5 Other fires and alarms 6 A thirty-year study of Boston's fire losses—comparison of losses with business conditions 7 The fire department 8 Mutual aid among fire departments of Greater Boston 9 Water supply, fire alarm traffic conditions, and salvage 10 Automatic sprinklers and other private fire protection 11 Investigation of fires 12 Fire prevention inspection 13 A technical analysis of the fire prevention laws and regulations governing Boston 14 Authority for inspection work 15 A recommended legal programme 16 Plan for a State wide attack on the fire waste

Such a report was of considerable interest not only from the insurance point of view and the study of local fire losses and insurance rates, but also for the various improvements that were indicated and which applied with more or less urgency in every American city. Although a report of this nature naturally involved considerable cost on their engineering side, it was the opinion of those directly interested that they are well worth the cost and effort as they bring to responsible governments and organizations a desired and comprehensive study.

During the year the National Fire Protection Association sponsored a conference on spontaneous heating and ignition of agricultural and industrial products, in cooperation with the U. S. Departments of Agriculture and Commerce, which was held in the Hotel Raleigh, Washington, Nov. 14-15, 1929. This led to the organizing of a committee after a series of interesting reports on research in this field had been presented and the problem discussed from the standpoint of specific interest.

During the year 1929 there were a considerable number of serious fires involving nitrocellulose films. This hazard has been present and realized for a number of years by fire underwriters, but the year under review witnessed the outbreak of serious disasters from this cause. The unfortunate loss of life for which motion-picture or other film was responsible was headed by the serious catastrophe in the motion-picture theatre in Paisley, Scotland, on December 31 in which 72 or more lives, mostly of children, were lost. This disaster was stated to be due to improper ar-

rangements for film projection, inadequate exits, and a resulting panic. The National Fire Protection Association and other fire-prevention authorities had for a number of years recommended the use of safety measures in connection with nitrocellulose film which was realized to be an extra-hazardous material. When it was not possible completely to safeguard a nitrate film, a cellulose-acetate film was available as a safe substitute so that with proper precautions this hazard could be reduced to a minimum.

Another serious fire was, in the Pathé Sound Studio in New York City on December 10, resulting in the loss of 10 lives. This building was of fire-resistant construction with an ample number of exits and contained a stored quantity of motion-picture film, which, however, did not contribute in any way to the loss of life. Inflammable scenery used in connection with a film production was responsible for the rapid spread of the fire. The stage used for the "set" did not have the protection required for an ordinary theatre and suffered particularly by the absence of automatic sprinkler protection. The loss of life was largely in or near the dressing rooms of the young men and among the men who perished in attempting to rescue them.

Another case in which highly flammable materials contributed to the spread of the flames was the Detroit "Study Club" fire which occurred on September 20. The night club was frequented by about 100 persons, of whom 22 lost their lives and 45 were seriously injured in attempting to escape. The fire was believed to have been caused by a lighted match carelessly thrown against a wall diaphy. In addition, proper fire prevention precautions, such as providing a rear exit and fire escape, had not been taken.

The greatest catastrophe of the year was the fire at the Cleveland Clinic Foundation of Dr. Cline on May 15, caused by certain ignition of nitrocellulose X-ray films. The larger number of the 121 victims died from the effects of gases containing carbon monoxide and nitrogen peroxide, formed by the burning films. Three theories were advanced as to the origin of the fire:

(1) Decomposition of the films caused by rise in temperature brought about by an uncovered steam line, (2) decomposition on account of the heat from an incandescent lamp in front of the shelves on which the films were stored, and (3) ignition of the films by a lighted match on cigarette stub dropped on or near them. The failure of three of the fire doors to close properly enabled the fumes to pass from the film room into the stair and elevator shafts and thence to the upper floors of the building menacing the lives of inmates and rescuers.

A fire of unusual interest was that in the executive office section of the White House in Washington on December 24. This fire, involving two hours active fighting by the District of Columbia Fire Department, endangered priceless records, although actually the destruction was confined to material easily replaceable and of limited value. The source of the fire was located in a wood stud against a fireplace, the construction of which was revealed as of faulty design. After a fire had been kindled in this fireplace, the wood stud ignited and after smouldering for several hours finally burned into the attic above, where it burst into flames. The attic was burned out and considerable damage was done, the entire roof and attic floor requiring rebuilding. Numerous

deficiencies in the construction and protection of this building were recorded in the survey made following the fire.

**FISKE, HALEY** An American insurance official, died suddenly in New York, Mar. 3, 1929. Born at New Brunswick, N. J., Mar. 18, 1852, he was graduated from Rutgers College in 1871, receiving the A. M. degree in 1874. After working on various newspapers, he studied law and in 1879 was admitted to the bar. In the first years of his practice, Mr. Fiske became connected with the legal work of the Metropolitan Life Insurance Company. When John Roger Hegeman assumed the presidency of the company in 1891, Mr. Fiske was made third vice president. In that capacity, he devoted his energies to increasing the importance of the company's ordinary insurance, which had suffered during an attempt to develop the industrial side of the business, the success of his endeavors did much to establish the finances of the company. Mr. Fiske also was influential in having a bill passed by the New York Legislature which insured to the policyholder certain rights in the management of the company. About this time, the public was prejudiced against child insurance, and bills prohibiting the practice were pending in several States, in an address before the State Legislature of Massachusetts, which contemplated the passage of such a bill, Mr. Fiske argued in favor of the practice, the bill was defeated and opposition subsequently diminished. At Mr. Hegeman's death, 1919, Mr. Fiske was made president of the Metropolitan Life Insurance Company, at that time the largest financial institution in the world. In an effort to further improve public health, he instituted several campaigns, such as radio broadcasting of setting-up exercises, and sending trained nurses to visit private homes, and under his presidency, the Metropolitan Company supported a number of improved housing projects. Mr. Fiske, who retained the position of president until his death, was also a director of the Metropolitan Life Insurance Company, and of numerous other important firms. He was active in the work of the Protestant Episcopal Church, being one of the leaders of the high-church wing. He was a trustee of Rutgers, of St. Stephen's College, and of the Cathedral of St. John the Divine. Rutgers University conferred on him the LL. D. degree in 1921.

**FISK UNIVERSITY.** A coeducational institution for colored people in Nashville, Tenn., founded in 1866. It consists of a liberal arts college, a music school, and a graduate department. The total enrollment of 489 for the autumn of 1929 included 206 men and 283 women. The total enrollment in the summer school of 1929 was 172, including 54 men and 118 women. The faculty numbered 42, and there were 44 administrative officers and assistants. The productive endowment for 1928-29 was \$1,065,232, and the total income was \$251,059. The library contained approximately 24,000 volumes. Thomas Elsa Jones, Ph. D. was president, Ambrose Calver, A. M., dean, and Jesse F. Beals, treasurer.

**FIXED NITROGEN** See FERTILIZERS.

**FLAX.** The flaxseed production in 1929 of eleven countries reporting to the International Institute of Agriculture, Rome, was estimated at 35,154,000 bushels, which was 10 per cent below the yield of 1928 and nearly 33 per cent below the average yield for the five years 1923-27. The crops of some of the more important producing countries were estimated as follows: India, 12,-

880,000 bushels, Canada, 2,007,000; Lithuania, 1,665,000. Poland in 1928 produced about 3,000,000 bushels and the Soviet Republics, according to a preliminary estimate, 22,755,000 bushels. Argentina, the leading flaxseed-growing country of the Southern Hemisphere, which produced 82,810,000 bushels on 7,297,000 acres in the crop year 1928-29 reported an area of 7,090,000 acres for the crop year 1929-30, and a preliminary estimate placed the yield at 55,627,000 bushels, a decrease of nearly one-third below the crop of the preceding season and the smallest yield since 1924-25. Uruguay, ranking next in South America, yielded 2,284,000 bushels in 1928-29.

The U. S. Department of Agriculture estimated the flaxseed crop of the United States in 1929 at 16,838,000 bushels, compared with 19,928,000 bushels in 1928 and a five-year average of 23,243,000 bushels. The acreage harvested was increased more than 12 per cent over the preceding year but drought in some States resulted in yields averaging only 5.6 bushels per acre, as against 7.4 bushels in 1928. On the basis of average farm prices per bushel on December 1 of \$2.84 this year and \$2.01 in 1928, the total value of the crop was \$47,871,000 and \$40,098,000 for the two years, respectively. Of 10 States reporting flaxseed production in 1929, the yields of the four States producing over 85 per cent of the crop were as follows: North Dakota, 6,876,000 bushels, Minnesota, 4,707,000 bushels, South Dakota, 3,758,000 bushels, and Montana, 938,000 bushels. The average yields in these States were 4.7, 9.6, 9.9, and 3.2 bushels per acre, respectively. During the fiscal year ended June 30, 1929, the United States exported 279,000 tons of linseed-oil cake, 900 tons of linseed-oil cake meal, and 2,020,000 pounds of linseed oil and imported 23,438,000 bushels of flaxseed and 6,677,000 pounds of linseed oil.

The estimated flax fibre production of 10 European countries, not including the Soviet Republics, as reported by the International Institute of Agriculture in Rome, was 291,482,000 pounds, which was 12.6 per cent above the yield of 1928 and 2.6 per cent above the average for the five years 1923-27. The 1929 yields of the principal fibre-producing countries were estimated as follows: Lithuania, including hemp fibre, 79,367,000 pounds, Belgium, 60,303,000, Latvia, also including hemp fibre, 42,527,000, Netherlands, 27,117,000, Czechoslovakia, 25,513,000, Estonia, 23,369,000, Austria, 17,505,000, and Northern Ireland 12,320,000. The Soviet Republics, which produce the greater part of the world's supply, reported a yield of 763,000,000 pounds in 1928. During the fiscal year ended June 30, 1929, the United States imported 5000 tons of unmanufactured flax fibre. About 2,200,000 tons of flax straw are produced annually in the United States and efforts were being put forth to find means of utilizing this material to good advantage industrially.

**FLEMISH NATURALIST PARTY.** See BELGIUM, under *History*.

**FLINT, FRANK PUTNAM** An American lawyer and former United States Senator from California, died Feb. 11, 1929. He was born July 16, 1862, in North Reading, Mass. In 1869 he was taken by his parents to San Francisco, Calif., where he attended the public schools. He studied law and in 1888 was admitted to the bar in Los Angeles and began practice there. From 1882 to 1892, he was a clerk in the U. S. Marshal's office, and assistant United States attorney in

1892-93. During 1893-95 he practiced law with Judge M T Allen From 1897 to 1901, he was United States district attorney for the southern district of California, and in 1905 he went to the United States Senate as a Republican from California. In 1911 he resumed his law practice with the firm of Flint & Mackay.

**FLONZALEY QUABTET.** See Music.

**FLOODS.** An unusual combination of snow, frozen ground, ice, high temperatures, and rain, resulted in sudden and destructive overflows of the interior rivers in Ohio during the latter part of February, with over \$3,000,000 damage. Of these floods, the most outstanding was that of the Miami River, the rise was comparable with the one in 1898, reputed to have been next to the greatest Miami flood on record.

Heavy rains which fell during February 26-28 brought the rivers in Georgia, Alabama, and northwest Florida to flood, and the torrential and almost unprecedented rainfalls of March 13-15 on the already saturated soil led to destructive overflows. The greatest of these floods were those in the Choctawhatchee and the Conecuh-Escambia systems of Alabama and Florida, where the rivers have very small slopes and were already bank full from earlier rains in February, the streams reached stages far beyond any previously recorded, and the damage amounted to nearly \$5,000,000. The floods in the other river systems involved were responsible for about \$3,500,000 damage. Overflows also occurred in the Cumberland River, and the tributaries of the Tennessee, with several million dollars damage, and 18 lives were lost along the Emory River.

Due to heavy rains, severe floods took place in central and eastern Texas during May, particularly along the Trinity and the Brazos rivers and their tributaries. The total damage amounted to about \$8,000,000. The highest stages since 1870 were reached in the Buffalo River and White Oak Bayou, and \$1,000,000 damage was caused in Houston. Several million dollars damage resulted from rises in the upper Mississippi, lower Missouri, and lower Arkansas basins in May. Following heavy rainfalls over central Kansas on July 8, 9, and 11, destructive rises occurred in the rivers of the region, particularly along Cow Creek, the upper Little Arkansas River, and the Cottonwood and upper Neosho rivers, the losses along Cow Creek alone amounted to \$3,750,000.

A tropical storm which crossed the extreme southeast United States resulted in two periods of particularly heavy rainfalls over this region on September 26-27 and September 30-October 1,

and brought disastrous floods to Georgia and the Carolinas. The most conspicuous of these was the double flood in the Savannah River at and below Augusta, the central and lower river reaching in 1929 stages of record with great rapidity. The losses in Georgia and South Carolina probably exceeded \$1,000,000. In the Altamaha Basin, the damage amounted to \$500,000, and in the Santee Basin, to over \$1,000,000.

Except for the lower Mississippi flood discussed below, the great number of other floods that occurred in the United States during 1929 were for the most part either comparatively unimportant or of a more moderate and less widespread character, though in the aggregate they resulted in large losses.

**THE LOWER MISSISSIPPI FLOOD OF 1929** In height, duration, and resultant damage, the flood of 1929 in the lower Mississippi River ranks among the greatest Mississippi floods on record. The lower river remained above flood stage for a longer time than ever before recorded except during the 1927 flood. The loss aggregated \$10,000,000. An important feature of this flood was that the levees, though subjected to an unusually long period of soaking and pressure, withstood the strain with only one crevasse.

The crests were unusually late, because the flood was in reality an upwardly progressive series of three floods, no one of which by itself would have been very severe. The first rise, brought about by waters from the upper Mississippi and the Ohio combining at Cairo, raised the lower river to flood stage in the latter part of March, the last and greatest rise, due to water passing into the already full lower Mississippi from the Missouri, the upper Mississippi, and the Ohio, about May 20, brought the crest, the lower Mississippi continued in flood into June. The area overflowed amounted to 1,830,550 acres, the greatest overflow and largest losses occurred in the Memphis and the Vicksburg districts.

The flood problem which had been brought to the fore by the Vermont and the Mississippi catastrophes, continued to be a major engineering problem during the year. Not only have there been important floods, apparently in unprecedented succession, in various areas of the United States, but the Mississippi problem also continued to keep the flood question in the public eye.

**MISSISSIPPI FLOOD CONTROL** Perhaps the most important development during the year in the Mississippi Flood Control plans was the decision handed down by Judge B C Dawkins in the U. S. District Court at Monroe, La., that floodway lands may not be subjected to the risk of destructive flood discharges unless the owners are compensated for their loss. It will be remembered, as noted in the 1928 YEAR BOOK, that the chief item making up the great difference in the estimated cost of these flood works, as figured by the Chief of Engineers of the Army and by the Mississippi River Commission, lay in the fact that the former had made no allowance for compensation to the owners of land in the special emergency flood channels which the plan provided for. It was recognized that the land within these proposed emergency floodways could be cultivated in most years, but that a flood might occur which would cause owners or operators to suffer serious loss. The decision states that "when the Government departed from the policy of building levees and other public works

LOSSES BY FLOOD IN THE UNITED STATES DURING THE CALENDAR YEAR 1929

Drainage	Reported Losses*	Lives
Atlantic	\$ 8,450,680	11
Gulf (except Mississippi River)	16,870,550	9
Mississippi (except Ohio River)	16,111,851	5
Ohio	12,995,850	34
Great Lakes	171,000	
Pacific	100,000	
Total	\$51,899,937	56

In addition to the above, 20 lives were lost and damage to an indeterminate amount (at least \$100,000) resulted directly or indirectly from several heavy thunderstorms during July in the Middle West and Rocky Mountain regions.

\* Probably about 75% of actual

for the purpose of commerce and navigation alone and expressly entered the field of controlling floods for the protection and reclamation of private lands, then it became engaged in activities which make it responsible for the invasion of private rights."

While this decision was to be expected, it will naturally alter completely the economics of the floodway plan. It is difficult to see how any other scheme than the emergency floodway could be economically developed, but the total cost of the project will now be increased by hundreds of millions, and it will probably prove economical to narrow the emergency floodways by levee construction and thus reduce the areas subject to flood damages. It may also bring up again the matter of what share the States involved were to pay in meeting the cost of this enormous project.

An amusing situation developed in connection with the Mississippi plan of flood protection by diversion, when Attorney-General Mitchell ruled that the engineering features of the flood control plan are not subject to review or change and that the approval by President Coolidge of the report of the special board on this project fixed the general features and characteristics of the plan. Apparently, therefore, the floodway problem will have to be solved and alternative plans, involving substitutes, are out of the question.

**MIAMI FLOOD WORKS.** These notable flood works received their most severe test since construction on February 25 and 26, when a high flood, which would have caused serious damage under the conditions which prevailed before the construction of the works (1915-1922), was experienced. Although the flood of 1929 was not as severe as that of 1913, which resulted in the formation of the Miami conservancy district and the building of the flood works, it is estimated to have equaled that of 1898. At that time, the levees at Dayton, Ohio, were almost topped and a considerable portion of the city inundated. In the February flood of 1929, the peak reached a gauge height of only 14 1/4 feet, whereas the previous peak was about 22 feet.

**DALLAS, TEXAS.** A project under construction will reclaim some 9940 acres of land in the valley of the Trinity River which, subject to overflow, has constituted a barrier between the city of Dallas on the east bank and Oak Cliff and West Dallas on the west bank. Rapid business and industrial development is expected to follow this improvement as flooding has occurred too frequently in these lower lands to permit their profitable development, and the city has been held back to the higher lands back of this area. Flood waters will be confined, by means of levees, within a main flood channel some 7 miles long and 2000 to 3000 feet wide. Some 26 miles of floodway levees are required, involving about 10,500,000 million yards of embankment. The channel construction will require about 2,600,000 yards of excavation. A total of about \$13,000,000 was to be expended.

**NEW MEXICO.** In August, the Rio Grande rose above its banks and inundated 30,000 acres. Before the damages could be repaired, another and greater flood, September 22-26, occurred. This was said to have been the greatest in 300 years of record. The valley for 52 miles in length and averaging a mile in width was covered with water which upon receding left a silt deposit of

from 4 to 10 feet. It was said the town of San Marcial was covered to a depth of 7 feet and would be abandoned. Plans of the middle Rio Grande conservancy district for flood control were held up by legal difficulties connected with a proposed bond issue. It was probable that affected corporations and districts in this area might go ahead with flood protection rather than await the outcome of these legal difficulties as the flood menace was pressing.

**ALABAMA.** A rainfall of remarkably high intensity, 13 to 27 inches falling in 24 hours, following a prolonged wet season, resulted in the worst floods on record in Southern Alabama March 14-15. One town, Elba, with a population of 1600, was practically wiped out, highways totaling 1350 miles were damaged and the railways in the area were hard hit.

**NEW ORLEANS.** An unusual article appeared in the *Engineering News-Record* (New York) of May 2 which called attention to the fact that the city of New Orleans runs a grave risk of inundation by Gulf storm tides. Comment followed under the caption "A City is Warned," and it was advised to look to its "backyard defenses quite as much as to those more spectacular ones on the riverfront." In the past, it had usually been necessary for a city to experience a disastrous flood before public opinion could be aroused to the point of providing flood protection. A new era of planning for the future was indicated in this important warning.

**FLORIDA, POPULATION.** A State census was taken in 1925. The result showed a total population of 1,263,549, compared with 968,470 by the Fourteenth United States Census of 1920, an increase of 295,079 in the five-year period. The estimated population of the State on July 1, 1928, was 1,411,000. The capital is Tallahassee.

**AGRICULTURE.** The following table gives the acreage, production, and value of the principal crops in 1928 and 1929.

Crop	Year	Acreage	Prod Bu	Value
Oranges	1929		9,500,000	\$26,125,000
	1928		15,000,000	29,100,000
Grapefruit	1929		6,500,000	19,825,000
	1928		10,500,000	18,900,000
Corn	1929	625,000	8,438,000	7,172,000
	1928	607,000	7,891,000	7,891,000
Potatoes	1929	23,000	2,711,000	4,985,000
	1928	31,000	3,875,000	5,812,000
Sweet potatoes	1929	29,000	3,190,000	3,750,000
	1928	28,000	2,460,000	2,832,000
Tobacco	1929	12,300	11,070,000	3,454,000
	1928	12,000	9,216,000	2,682,000
Cotton	1929	95,000	29,000	2,422,000
	1928	95,000	19,000	1,700,000
Hay	1929	90,000	64,000	1,116,000
	1928	92,000	67,000	1,261,000
Peanuts	1929	208,000	121,800,000	4,263,000
	1928	194,000	111,550,000	4,685,000

\* Boxes.    \* Pounds.    \* Bales    \* Tons

**MINERAL PRODUCTION.** The leading State in the production of phosphate rock, Florida profited in 1928 by an improvement in this industry. In 1927 the State produced about four-fifths of the country's total of this product, there were produced 2,637,420 long tons, in value, \$8,646,162, in 1926, 2,708,207 tons, \$8,083,508. The increase in annual stone production continued, the quantity produced in 1927 was 7,437,580 short tons, as against 6,785,430 for 1926, value of stone produced was lower in 1927, however, being

\$6,138,767, to \$7,411,506 for 1926. The yearly output of clay products, \$402,190 for 1927, was little changed. Sand and gravel production was considerable in 1927, but decreased, especially in value. Among the minor products, zinc was especially active, there being produced, in 1927, 3646 short tons, of the value of \$304,600, in 1929 1292 tons, in value \$129,200 had been produced. This product had risen steadily from a total of 10 tons in 1922. The aggregate mineral production of the State for 1927 was \$18,095,961, for 1926, \$19,700,522.

**TRANSPORTATION** The total number of miles of railroad line under operation on Jan. 1, 1929, was 5738.07. There were built, in 1929, 9.57 miles of additional first track.

**MANUFACTURES** According to the biennial Federal Census of Manufactures published by the Department of Commerce in 1929 and relating to operations of 1927, there were in the State, in 1927, 1912 manufacturing establishments. These employed 61,219 wage earners, whose wages for the year totaled \$56,671,574. Materials and supplies used in production cost \$91,715,524. Manufactured products attained the combined value of \$218,790,152.

**EDUCATION** The failure of the Legislature to approve the recommendations of a report rendered by the State school survey commission was attributed to a lack of a general realization of the State of the need of State-wide action in school matters. The school population of the State was reckoned according to the census of 1927, which gave it as 391,299. There were enrolled in the public schools, in 1928, 361,357 pupils, of whom 320,433 were in elementary and 40,924 in high-school grades. Expenditures for public school education in 1928 totaled \$27,124,091. The average monthly salary of public school teachers was \$121.80. It varied greatly, being \$178.60 for white men teachers, \$124.40 for white women, \$89 for Negro men and \$63.80 for Negro women.

**CHARITIES AND CORRECTIONS** The central organization of the State dealing with matters affecting the care and custody of persons in 1929 was the Board of Commissioners of State Institutions, consisting of the Governor and six other of the chief State officers. Under control of this Board were five institutions: the Florida Industrial School for Boys, Marianna; Florida Industrial School for Girls, Ocala; Florida State Hospital (for the insane), Chattahoochee; Florida State Farm (the State penitentiary), Raiford; Florida Farm Colony (for feeble-minded children), Gainesville.

**LEGISLATION** The regular biennial session of the State Legislature convened on April 2. It adjourned on June 1, at the end of the 60-day term, but Governor Carlton immediately summoned the Legislature into successive special sessions on the ground that matters of appropriation, finance, taxation, and education had not been settled, and eventually the measures that he sought were enacted. Among the chief measures passed were those levying a series of taxes. A gasoline tax of 6 cents a gallon was enacted with provisions applying two of every six cents so raised to the liquidation of road and bridge indebtedness of the counties, totaling approximately \$161,000,000, one and two-thirds cents to the counties' expenditures for common schools, and one-third of a cent to local road and bridge construction. A tax was placed also upon petroleum

products stored within the State. An occupational license tax, brought into being, was designed in part for revenue and in part as a safeguard to business practice. It required among other things that a tax be levied on all bankrupt, fire, wreck, and water-damage sales of goods. The occupations subjected to license were required to pay \$250 in each county where their business was conducted.

Bank laws were enacted to meet the situation produced by the difficulties of certain of the banks of the State. Amendments of bank charters were forbidden save on the vote of at least three-fourths of the stock and the approval of the Governor. The minimum bank capital was raised to \$25,000, from \$15,000, and to \$50,000, except on special approval of the comptroller, save in places of not over 3000. Loans to any of the bank personnel in excess of 10 per cent of an institution's capital and surplus were forbidden, secured loans to others up to 25 per cent were permitted. Bank and trust company investments were limited. Dividends were limited to 10 per cent and made conditional on the transfer of one-tenth of profits to surplus. One-half of profits thus transferred were to be invested in specified types of security and deposited with the State Treasurer, up to an amount equal to that of the capital stock, for withdrawal and use as the comptroller might direct. A new official, the bank liquidator, was created charged with winding up banks of which the impaired capital could not be made good by the assessment of stockholders.

It was made unlawful to ship from the State between August 31 and December 1 green citrus fruit, except tangerines, unless bearing certificate of inspection and maturity. Improvement projects of drainage districts were made subject to the approval of 60 per cent of the property owners. A resolution for a constitutional amendment to authorize an issue of \$50,000,000 of State bonds to stabilize county finances were proposed.

**POLITICAL AND OTHER EVENTS** With the discovery that the Mediterranean fruit fly had gained a hold in the citrus orchards of Florida, there followed early in 1929 a time of trial for the citrus-fruit growers of the State. In April, the Federal Department of Agriculture organized a force under Dr. Wilmo C. Cresson, the State plant commissioner, to check the spread of the pest. A Federal quarantine was maintained. An area was described, largely in Orange and Lake counties, in which all citrus fruit was to be destroyed, and strict inspection was maintained in the surrounding zone for a distance of 9 miles from the infected region. It was estimated in July that 34 per cent of the land area of the State and some 72 per cent of the citrus-bearing trees had then been included within the infected district. The possible loss for the year, in citrus fruit and other affected vegetation, was reckoned at about \$60,000,000, this estimate excluding the threatened depreciation of a capital investment of some \$300,000,000 in the infected area. The situation had a bad effect on banking within the State.

Early in July, many of the small banks suspended, and on July 17 two of the larger banks of Tampa and some twelve smaller banks, with aggregate deposits of about \$22,000,000 ceased payments. The quarantine was somewhat alleviated by a revision of its terms that went into effect on September 1. The Federal Farm Board

made on August 8 its first loan, an advance of \$300,000 to the Florida Citrus Exchange, in an effort to relieve the growers' difficulties.

A movement was started early in the year to induce the Federal Government to undertake a part of the cost of drainage work in the Everglades and received some support from General Jadwin, Chief of Engineers, U. S. A. The city of Lake Worth was enjoined by Federal court order on May 29 from expending the proceeds of paving and sewer certificates in its possession, otherwise saved to pay interest on its municipal obligations in arrears. The project for the purchase of the East Coast Canal by the Florida Inland Navigation District, a creation of the Legislature of 1927, including 11 counties, and the transfer of the canal to the Federal Government, was advanced by the Legislature's act validating the issue of \$1,887,000 authorized in 1928 by the district, and by a decision of the State Supreme Court sustaining the act. The city of Miami opened a municipal airport on January 8. The Florida cane-sugar industry was advanced by the enlargement of the sugar mill of the Southern Sugar Company, at Clewiston, to its capacity to 4000 tons a day by the year, the mill's previous capacity had been 1500 tons a day.

**OFFICERS** Governor, Doyle E. Carlton; Secretary of State, W. M. Igou (succeeding H. Clay Crawford, deceased); Attorney-General, Fred H. Davis; Comptroller, Ernest Amos; State Treasurer, W. V. Knott; State Superintendent of Public Instruction, W. S. Cawthon; Commissioner of Agriculture, Nathan Mayo.

**JUDICIARY** Supreme Court Chief Justice, Glenn Terrell; Associate Justices, W. H. Ellis, James B. Whitfield, Armstead Brown, Rivers Buford, L. W. Strum.

**FLORIDA, UNIVERSITY OF** A State institution of higher education for men in Gainesville, Fla., founded in 1905. In the autumn of 1929, the registration totaled 2148, distributed as follows: Arts and sciences, 517; commerce and journalism, 464; teachers, 316; engineering, 275; law, 231; agriculture, 161; pharmacy, 52; architecture and allied arts, 52; graduate, 80. The registration for the summer session of 1929 was 1613 men and women. The faculty numbered 161 (exclusive of student assistants and research men). The cost of operating and maintenance was \$2,330,276, the annual endowment was \$315,488. The library contained 90,000 volumes. A dormitory costing \$150,000, an artillery unit, and a radio broadcasting station were completed in 1929. President, John James Tigert, LL.D.

**FLORIDA STATE COLLEGE.** An institution for the higher education of women in Tallahassee, Fla., founded in 1905. The enrollment for the autumn of 1929 was 1594, distributed as follows: Graduate school, 12; college of arts and sciences, 654; school of education and normal school, 710; school of home economics, 145; school of music, 73. The enrollment for the summer session was 766. The faculty numbered 147 members. The income from endowment for the year was \$6150, State appropriations amounted to \$539,180. There were 30,578 volumes in the library. During 1929 a new gymnasium was erected and the library was enlarged so as to serve the needs of the college during a long period of expansion. President, Edward Conradi, Ph.D.

**FLOTATION.** See **METALLURGY.**

**FOCH, MARSHAL FERDINAND** French military leader, Generalissimo of the Allied and Associated Powers in France during the World War, died in Paris, Mar. 20, 1929. He was born on Oct. 2, 1851, at Tarbes in the Pyrenees, educated at St. Clement's at Metz and L'Ecole Polytechnique, and commissioned in the Artillery in 1873. In 1896 he was appointed professor at the Ecole Supérieure de Guerre, later becoming director of the school. When the World War broke out in 1914, he was in command of the 20th Corps at Nancy, known as the "Tron Division." This position was followed by command of the 9th Army, which itself at the Battle of the Marne. In the course of the battle, Foch sent to Joffre the famous message "*Mon centre cède et ma droite recule. Tout va bien. L'attaque.*" epitomizing his daring methods of warfare, his refusal to admit defeat. When, in 1917, Pétain was made commander-in-chief of the French Army, Foch succeeded him as chief of the staff. In the same year, also, he was appointed president of the Inter-Allied Executive War Board established at Versailles. When the necessity for a unified command was felt early in 1918, at a conference at Doullens, Foch was chosen, at the proposal of Lord Milner of England and with the acquiescence of Field Marshal Haig and General Pershing, Generalissimo of the Allied and Associated Powers in France. In August of 1918, as commander-in-chief, he began the offensive that brought about the Armistice of November. He agreed to an armistice instead of pushing on into Germany because he believed that he had no right to shed one drop of blood after it was no longer necessary. At the Peace Conference of Versailles, he advocated the establishment of the French military frontier along the Rhine, believing that the League of Nations did not offer France a sufficient guarantee. In recognition of his service, France bestowed upon him the Grand-croix de la Légion d'honneur, the Médaille militaire, and the Croix de guerre, made him Maréchal de France in 1918, and elected him to membership in l'Académie Française and l'Académie des Sciences. England gave him the British Order of Merit, made him Knight of the Grand Cross of the Bath, and Oxford gave him an honorary D.C.L. Both England and Poland made him a field marshal. From the United States, he received the Medal for Distinguished Service, and when he visited that country in 1921, he was acclaimed with enthusiasm. On his death, France accorded him a state funeral such as had been given previously only to Léon Gambetta, Victor Hugo, President Carnot, Louis Pasteur, and President Faure in the history of the country. Foch's military memoirs were left unfinished, but in his previously unpublished works, he had set forth his philosophy of warfare, which in great part was foisted on the teaching of Napoleon. He wrote *Les Principes de la Guerre* (1903), *De la Conduite de la Guerre* (1904); and *Éloge de Napoléon* (1912). Consult *Foch Speaks*, by Major Charles Baguet (English translation, 1929).

**FOGG MUSEUM.** See **ART MUSEUMS.**

**FOLWELL, WILLIAM WATTS** American educator, died in Minneapolis, Minn., Sept. 18, 1929. He was born in Romulus, N. Y., Feb. 14, 1833, was graduated from Hobart College in 1857, and after teaching a year at Ovid Academy, N. Y., returned to Hobart as professor of mathematics, 1858-60. In 1860-61 he studied in Berlin, return-

ing to the United States to join the 50th New York Engineers, where he was promoted, during the course of the Civil War, from first lieutenant to major, and at the close of the war was breveted lieutenant-colonel. After the war, from 1865 to 1869, he was in business in Ohio, but in 1869, he became professor of mathematics at Kenyon College. In the same year, he was elected to the presidency of the University of Minnesota, serving in that capacity until 1884, when he resigned to devote himself exclusively to teaching political science. In 1907 he retired from active work in the University of Minnesota, becoming president emeritus. Professor Folwell was the author of four volumes of Minnesota history.

**FOOD AND NUTRITION.** **Food Prices.** *United States.* The index number of wholesale prices of foods reported by the Bureau of Labor Statistics, U. S. Department of Labor (*Mo Labor Rev.*, vol. xxiv, p. 216) was 101.2 for October, as compared with 102.3 for October, 1928 (1926 = 100). Among the principal food groups, meats were considerably lower, 106.7 as compared with 116.4, milk and dairy products slightly lower, 100.2, as compared with 108.4, and all other foods combined higher, 95.8, as compared with 91.2 for 1928. *Bradstreet's* food index number based on the wholesale prices per pound of 31 articles of food was \$3.12 for the week ended December 28, as compared with \$3.26 for the week ended Dec. 27, 1928.

The combined retail prices of 42 articles of food, as reported by Bureau of Labor Statistics (*Mo Labor Rev.*, vol. 29, p. 195), were 2.3 per cent higher on Oct. 15, 1929, than on Oct. 15, 1928. Increases of 1 per cent or more were shown in 12, and decreases in 21 of the individual food items. Navy beans were 14, potatoes 73, and pines 23 per cent higher, onions 13 and oranges 30 per cent lower on Oct. 15, 1929, than on Oct. 15, 1928. The combined index number for all of the articles included was 160.5, as compared with 160.8 for the preceding year (1913 = 100). The drop in wholesale prices of meats was not reflected in the retail index numbers which, on the contrary, increased from 188.9 in 1928 to 189.2 in 1929. Dairy products decreased from 151.1 to 149.3 and cereals from 163.9 to 163.5.

*Other Countries.* The general trend of retail food prices throughout the world may be seen from the accompanying table compiled from data reported in the *Federal Reserve Bulletin* of December, 1929 (p. 808). The index numbers, which have been constructed by the various foreign statistical offices, are based on the prices of a number of articles of food weighted according to different standards, but unless otherwise noted referable to the original pre-war basis of 100. England alone showed a slight decrease in retail food prices and New Zealand no change. All of the other countries listed showed increases in retail food prices over the corresponding period in 1928.

**FOOD SELECTION AND EXPENDITURE.** In a comparison by Woodhouse (*J. Polit. Econ.*, vol. 38, p. 552) of the standards of living of a professional man's family in Washington, D. C., in 1816-17 with that of a similar family in 1926-27, as determined by household accounts kept by both families, interesting facts were brought out concerning changes in dietary habits which have taken place in the past century. The total expenditures for food in the two families, which were practically the same size, were strikingly similar, \$916 for the 1816-17 and \$914 for the 1926-27 family. The distribution of the total food budget for the principal food groups, however, was quite different. The 1816-17 family spent 36.3 per cent of the total for meat, poultry, and fish, 16.4 per cent for milk and dairy products, and 10.6 per cent for fruits.

Corresponding figures for the 1926-27 family were 17.8, 34.1, and 23.7 per cent, respectively. The main factors responsible for these wide variations were thought by Woodhouse to be the advance in scientific knowledge of diet and the improvement in transportation and marketing facilities which have taken place during the century. Applying the Sherman rules that, whatever the level of expenditure, at least as much should be spent for milk and dairy products as for meats, poultry, and fish and at least as much for fruits as for meat, poultry, and fish (*Food and Nutrition*, 3d ed., p. 599), it will be seen that the 1816-17 figures fell far short of and the 1926-27 figures were well above these standards.

These were professional families living in a city. A recent investigation by McKay (*Ohio Agr. Expt. Sta. Bul.*, 433) of food consumption and expenditures for rural families in Ohio showed that 16.62 per cent of the total expenditure for food was for milk, cream, and cheese, 25 per cent for fruits and vegetables, and 23.39 per cent for meat, fish, and poultry. These diets were thus above the standard for fruits and vegetables and only slightly below for milk and dairy products. The diets of Utah farm families were found by Brown (*Utah Agr. Expt. Sta. Bul.*, 213) to be above the standard for milk and dairy products and slightly below for fruits and vegetables as calculated in terms of percentage distribution of total calories. Hawley (*U. S. Dept. Agr. Circ.*, 89), from an analysis of a large number of dietary records at institutions housing college students concluded that in these institutions milk and dairy products and fruits and vegetables played too small a part in the diet, but that the diets planned by trained dietitians were more nearly adequate in every respect than those planned by persons untrained in food values.

No direct comparison is possible for the cost of the diets in these various studies, since different price levels were used. In the Ohio study, the estimated average cost per man per day based on 1928 price indexes was 41 cents. Hawley, using 1926 prices, estimated the average cost of the food served to the college students in the various institutions studied to be from 40 to 45 cents per man per day.

The growth of the cafeteria system of feeding in institutions and elsewhere and the expansion of drug-store soda fountains into lunch rooms has made the question of food value received for money spent in such eating places of importance to those who are trying to live on a minimum allowance. Benedict and Farr (*New Hampshire Agr. Expt. Sta. Bul.*, 242) have determined the energy value and protein content of a large number of individual foods and food combinations regularly eaten in college cafeterias and restaurants and at soda fountains and have calculated their results in terms of servings and amount purchasable for 10 cents. Their figures emphasize the wide variations in food value of different combinations of equal cost and the high caloric value of many of the between-meal and soda-fountain foods. Sandwiches, while vary-

ing widely according to their filling, averaged about 200 calories and from 5 to 10 grams of protein for 10 cents. Package sandwiches consisting of crackers with various fillings averaged about as many calories for 5 cents as most of the regular sandwiches for 10. Half-pint servings of ice cream, generally sold for 15 cents, furnished about 500 calories and 7 grams of protein, one pint of chocolate milk from 450 to 500 calories and from 14 to 15 grams of protein, and candies such as sold in 5-cent packages averaged about 450 calories for 10 cents.

The high caloric value of 5-cent package sandwiches and candies should be kept in mind by those interested in the proper diet for their children or in avoiding obesity for themselves. The committee on nutritional problems of the American Public Health Association in its annual report (*Am J. Pub Health*, vol 10, p 1205) called attention to the advertising claims made in behalf of a larger use of sweets as food not only for adults but even for children. Reviewing briefly the nutritional significance of each of the different types of food materials, they pointed out that sugar contributes nothing of food value except as a source of calories and that consequently "the proper place of sugar in the food supplies and eating habits of children is not in such concentrated forms as candy, nor in the indiscriminate and excessive sweetening of all kinds of foods, but rather as a preservative and flavor to facilitate the introduction into the child's dietary of larger amounts of the fruit and the milk, the importance of which to child health has been increasingly emphasized with each year's progress in our knowledge of nutrition."

This caution against the excessive use of sweets might well be extended to adults, particularly from the standpoint of avoidance of obesity. Adams (*J Nutrition*, vol 1, p 339) compared the weight with reference to age of 673 diabetic patients at the Mayo Clinic with values from actuarial tables with the conclusion that 91 per cent of the patients were overweight before the onset of diabetes and that, as far as could be judged by case reports, in over half of the entire group the obesity was the result of overeating and thus preventable. Emerson and Manny (*J Amer Med Assoc*, vol 93, p 457) from medico-actuarial tables plotted the mortality figures for various ages against weight with the finding that above the age of 35 the mortality figure increased about 1 per cent for each pound above the optimum weight. This should not be considered as an argument for the present fad of excessive weight reduction though such means as the "fast diet" but rather for moderation in the use of foods which furnish nothing but calories and for greater emphasis on the so-called protective foods such as eggs, milk, fruits, and vegetables. In the opinion of Langseth (*J Am Med Assoc*, vol 93, p 1607) a diet containing a high percentage of non-protective foods conduces to early degenerative diseases such as hypertension, arteriosclerosis, arthritis, and chronic gastrointestinal disease, and conversely a diet containing a high percentage of protective foods presumably is capable of modifying and of preventing such a condition.

**INFANT FEEDING.**—The importance of safeguarding the health of the child through the mother during pregnancy and lactation received new emphasis from the demonstra-

tion both in laboratory experiments and clinical experience of the very large requirements of the mother for the vitamin-B complex (vitamins B and G), if her milk is to be the sole source of these vitamins for the breast-fed child. Specific recommendations for diet during pregnancy and lactation were made by Macy and ' (Am J Diseases Children, vol 37, p 379) and by West (*Arch. Pediatrics*, vol 46, p 640). The diet recommended by the latter includes daily one raw citrus fruit or tomato, one raw and two cooked green vegetables, one quart of milk, and one tablespoonful of wheat-germ sugar (Vita-vose) added to the milk or sprinkled on the cereal.

The remainder of such a diet should consist of palatable foods such as cereals, eggs, meats, vegetables, and simple desserts, with calves' liver, kidneys, or sweetbreads in place of meat at least once a week. It is said that many breast-fed babies formerly fretful and irritable, with poor appetite and unsatisfactory growth, have done well after the mother has been given this vitamin-rich diet, showing that the breast milk has increased in quality and quantity. If the results are not entirely satisfactory, supplementary feedings are given the babies of from  $\frac{1}{2}$  to  $1\frac{1}{2}$  oz of the wheat-germ sugar or  $\frac{1}{2}$  teaspoonful of dried brewers' yeast in a 20-oz formula.

In many hospitals some source of the vitamin-B complex is now being used in the routine feeding of babies. Dennett (*J Am Med Assoc*, vol 92, p 769) reported improvement in appetite, cessation of fretfulness and prompt increase in weight in babies receiving wheat-germ sugar in amounts varying from 1 to 4 level tablespoonfuls per day in simple dilutions of fresh, boiled, or dried cow's milk. Blossom (*Am J Diseases Children*, vol 37, p 1161) reported such improvement in babies receiving supplement of brewers' yeast daily that then stay in the hospital was considerably shortened, as compared with that of babies not receiving this supplement.

Mairiott and Schoenthal (*Arch Pediatrics*, vol 46, p 135) found evaporated milk in suitable modifications to be especially satisfactory for premature infants and for those suffering from nutritional or gastrointestinal disorders. Bienneman (*J Am Med Assoc*, vol 92, p 364) attributed the success of both evaporated milk and lactic-acid milk in infant feeding to the attenuation of the curd, as compared with fresh milk. Ashton, Springfield, and Martin (*Arch Pediatrics*, vol 46, p 75) reported success in the use of dried whole milk in place of fresh whole milk modifications in infant feeding.

Irradiated milk has come into extensive use on the continent of Europe in the prevention and cure of rickets. In England, Watson and Finley (*Lancet*, 1929, II, p 704), as the result of an investigation of the therapeutic properties of irradiated fresh milk, stated as their opinion that "the cure of the disease is established more quickly, effectively, and economically by the use of irradiated milk than by various irradiated commercial preparations." Hess, a leading authority on rickets, considers that irradiated fluid or dried milk is a promising preventive measure, but that "it has been used for too short a time to warrant its being singled out as the method of choice."

**NUTRITION OF CHILDREN.** The striking arrest in dental caries, noted in last year's report as

occurring in children under rigid dietary control for diabetes, was also obtained by Boyd, Drain, and Nelson (*Am J Diseases Children*, vol. 38, p. 721) in several groups of nondiabetic children. One group received the low-carbohydrate, high-fat diet of the diabetic children, another, diets furnishing carbohydrates, protein, and fat in liberal amounts, and a third, diets high in carbohydrate and protein, and with practically no fat. The dietary factors in common in all of the groups were liberal allowances of vitamins and minerals and at least a gram of protein per pound of body weight. In all cases, dental caries was definitely checked. Boyd and his associates were of the opinion that the arrest of caries was due to the adequacy of the diet in all essential factors rather than the limitation of the amount of any of the foods commonly used. "However, the use of any component in excessive amounts may lead to the omission from the diet of other essential foods, and such omission may render the teeth susceptible to decay. If extensive use of sugars and starches is found associated with caries, it is probably to be explained on this basis."

The condition of the teeth of children thus appears to be an important index of nutritional status. Davies (*J Home Econ*, vol. 21, p. 106), in presenting suggestions for evaluating data on dental conditions emphasized the fact that no one index of health can be used to the exclusion of others in judging the nutritional status of children, but suggested that when dental conditions are bad the search for the cause may well begin in a study of the content of calcium and of vitamins A and C in the diet.

Daniels and Hejman (*Am J Diseases Children*, vol. 37, p. 1128) reported that in male infants from 2 to 8 months of age, the relation between creatinine excretion and body length appeared to be a more accurate measure of the child's physical development than the height-weight relationship. While admitting that many more data were needed to confirm these findings and to determine the norms of children of different ages, they were hopeful that the establishment of such norms might be accomplished and "lead to a more rational method of evaluating and treating the so-called undernourished child."

The use of standard height-weight tables for estimating the nutritional status of children received considerable criticism during the year. Turner (*Am J Pub Health*, vol. 19, p. 969) pointed out various sources of error in the use of such tables, with the conclusion that they give average values rather than normal weight and that it is "unscientific and unfair to set average weight as a goal for all children." In his opinion, emphasis should be placed upon regular gains in weight rather than upon the child's underweight status. Franzen (see *Bibliography*), from a statistical study of measurements of about 7500 public-school children of the fifth and sixth grades concluded that the correlation of height and weight was not nearly as high as that of other skeletal combinations with weight and recommended as the most accurate index of nutritional status for the ages represented in his study "the actual amount of subcutaneous tissue over the biceps minus the amount of subcutaneous tissue over the biceps to be expected from height, chest dimensions, width of hips and bisacromial width."

**FOOT AND MOUTH DISEASE** See VETERINARY MEDICINE

**FOOTBALL** The season of 1929 found many football eleveners playing a brand of game far above what had been shown the year previous. Once again did football prove that it had the greatest hold on the affection of the sporting public of any game. The meeting between two of the strongest teams—Notre Dame and Southern California—in Chicago was witnessed by the largest crowd in the history of the sport. One hundred and twenty-three thousand people thronged the Soldiers' Field and saw Notre Dame win, 13 to 12.

Some of the more important teams that showed a distinct improvement in their play in 1929 were Notre Dame, Purdue, Pittsburgh, Fordham, Colgate, Harvard, Vanderbilt, North Carolina, St. Mary's, Utah, Texas Christian, Western Maryland, and Bucknell. No real champion could be selected although the Notre Dame eleven was generally recognized as the equal or superior of any other team. The Knute Rockne coached aggregation, the Purdue and Pittsburgh eleveners were undefeated and untied in the regular season.

and had the best records in the matter of defeating high-class opposition.

Approval of the Fumble Rule was withheld and there was much discussion and dissension concerning this statute which makes a ball which is fumbled and has touched the ground a dead ball. This rule does away with all uncertainty when a man might win the game by picking up a fumble and running for a touchdown. A development of the season was the expulsion of Iowa University by the Western Conference. The Big Ten convicted Iowa of making illegal arrangements with some of its best athletes, football players among them, and an aftermath of that was an earnest desire by Iowa to make a change for the better. The ethical standing of football and other sports at some of the universities suffered a blow from the findings of the Foundation report, published in November.

Some of the outstanding players of the season were Booth, Yale, quarterback; Cagle, Army, halfback; Donchess, Pittsburgh, end; Saunders, So California, quarterback; Carideo, Notre Dame, quarterback; Wood, Harvard, quarterback; Siano, Fordham, centre; Tricknor, Harvard, centre; Marsters, Dartmouth, halfback; Banker, Tulane, fullback; McKiver, Tennessee, halfback; Welch, Purdue, fullback; Wakeman, Cornell, tackle; Uansa, Pittsburgh, halfback; Nagurski, Minnesota, tackle; Cannon, Notre Dame, guard; Lom, California, halfback, and Schoonover, Arkansas, end.

The scores of some important games follow:

Stanford, 21-California, 6; California, 15-Southern California, 7; Pittsburgh, 34-Carnegie Tech, 13; Notre Dame, 7-Army, 0; Yale, 21-Army, 1; Illinois, 17-Army, 7; Fordham, 7-Boston College, 0; Harvard, 14-Cornell, 0; Navy, 13-Dartmouth, 6; Yale, 16-Dartmouth, 12; Dartmouth, 34-Harvard, 7; Yale, 16-Dartmouth, 12; Fordham, 14-Bucknell, 0; Fordham, 26-New York University, 0; Georgia, 15-Yale, 0; Notre Dame, 26-Georgia Tech, 6; Detroit, 14-Georgetown, 13; Yale, 13-Maryland, 13; Harvard, 14-Florida, 0; Lehigh, 13-Lafayette, 12; Pennsylvania, 10-Lehigh, 7; Navy, 0-Georgetown, 0; New York University, 27-Georgia, 19; Notre Dame, 13-Southern California, 12; Notre Dame, 14-Navy, 7; Notre Dame, 26-Northwestern, 6; Oregon State, 14-Detroit, 7; Pennsylvania, 20-Columbia, 0; Penn State, 19-Pennsylvania, 7; Pennsylvania, 7-Navy, 2; Pittsburgh, 20-Penn State, 7; Pittsburgh, 12-Nebraska, 7; Princeton, 7; Yale, 13-Princeton, 0; Yale, 6-Purdue, 32-Indiana, 0; Santa Clara, 13-Stanford, 7; Tennessee, 6-Kentucky, 6.

**FORD COLLECTION.** See ART SALES.

**FORDHAM UNIVERSITY.** A Roman Catholic institution for higher education, under the Society of Jesus at Fordham, New York City, founded as St. John's College in 1841. It is the largest Roman Catholic educational institution in the United States. The enrollment for 1929-30 totaled 9939 students, including 2748 in the teachers' college and 760 in the graduate school, and a distribution among the other colleges as follows: Law, 1318; pre-law, 632; college, 1322; business administration, 225; pharmacy, 566; social service, 313; Irish studies, 135; preparatory school, 603; the registration for the summer session of 1929 was 1417. There were 376 faculty members. The endowment fund on June 30, 1929, amounted to \$141,290. There were 110,000 volumes in the library. President, the Rev. William J. Duane, S. J., Ph.D.

**FOREIGN EXCHANGE.** See FINANCIAL REVIEW.

**FOREST FIRES.** See FORESTRY.

**FORESTRY.** Perhaps the outstanding feature in American forestry during the year 1929 was

the continued development of a saner attitude on the part of the people toward commercial enterprises. A live-and-let-live attitude of mind became increasingly apparent, recognizing the fact that lumber producers have their own large problems, such as increased taxation and increased inaccessibility of the raw materials, etc. Both parties, the conservationists on the one hand and the lumbermen on the other apparently realized that the careful study of problems and the development of broad, far-reaching policies were better in the end than bitter controversy and unreasonable regulations.

The year 1929 was marked by a notable increase, especially in the eastern part of the country, in the number and size of State, county, and town-owned forests. In addition to aesthetic reasons, these forests were often purchased with a view to increasing public revenues and providing work for local citizens in the dull winter season. In several States, legislation was passed to encourage the purchase of forest lands, in fact all signs indicated that people are becoming more and more forestry minded. No longer is the forest considered as merely an area of waste land but rather as a source of valuable products and from the recreational viewpoint as a necessary adjunct to the public welfare. The forest conservationist is no longer looked upon as a dreamy idealist but rather as a far-sighted and patriotic citizen.

**LUMBER PRODUCTION.** Despite the growth of the national population, there has been, according to the U. S. Forest Service, a consistent decline in per-capita consumption of lumber in the United States from a maximum of 525 feet in 1906 to a minimum of 280 feet in 1927, the last year for which figures are available. The decline in per-capita consumption accompanied a decline in total production, making earlier forecasts of impending shortage inaccurate. The U. S. Forest Service (*Report of the Forester* for year ended June 30, 1929) estimates that the remaining stands of virgin timber in California and in the northwestern States include approximately 1,000,000,000 board feet which, on the basis of the present output of 15,000,000,000 feet per year, would last over 60 years, even with a new growth. Apparently considerable work has been and is being raised by conservationists in the past has been ill-founded. The U. S. Forester declares that too rapid cutting, with consequent flooding of markets, is more of a problem at present than an impending shortage. In the rush to liquidate the vast holdings in order to meet current expenses, the lumber owners are forced at times to sacrifice much material which, though now unprofitable, would in time be commercially valuable. That the lumbermen themselves fully appreciate the evils of the situation was evident in an appeal on the part of the directors of the National Lumber Manufacturers Association to the U. S. Congress for legislation looking to the control of production of lumber in the same manner proposed for coal, oil, and other natural resources.

**THE FOREST-FIRE PROBLEM.** As a result of long continued droughts in the Pacific Northwest, 1929 had the unfavorable distinction of being one of the worst forest-fire years in recent times. Information released by the Forest Service on October 9 stated that a total of 842,000 acres had been burned over in the National Forests up to that time. The immediate loss in timber in the Pacific Northwest and Inland Empire region

alone was roughly estimated at \$3,000,000. The serious rôle played by lightning was indicated in a record of 239 lightning-caused fires in a single day, August 29, in the northern district alone. Incendiarism was also a serious problem in certain areas, there being 51 such fires in a single day in the Klamath National Forest in northern California. The U. S. Forester, Major R. Y. Stuart, in his above-mentioned annual report, pointed out the need of greater protection facilities, including more men, better equipment, and, above all, roads and trails enabling the fire fighters to rapidly reach the danger zones before the fires had gained full momentum.

A study by the Forest Service showed that in the four Western districts there was a total of 17,757,331 acres (an area equal to one-half the State of Iowa) without roads and trails. Obviously, quick control is impossible under such conditions. Reforestation becomes almost useless under conditions of inadequate fire protection. The Forester adds that with present resources, approximately 37 years will be required to develop a satisfactory road and trail system. Means of communication, such as telephone and radio, also are sadly deficient in many areas. The possibilities in adequate protection are shown in a Forest Service statement that fire losses in 1928 on the protected 68.5 per cent of total forest area in the United States were less than one-eighth of those on the unprotected remainder.

**THE NATIONAL FORESTS.** According to the 1929 report of the U. S. Forester, the net area of the National Forests was 159,750,520 acres at the close of the fiscal year, June 30, 1929, representing a net gain during the year of 269,664 acres. A clearer idea of the immense area of these properties is gained by comparison with that of our largest state, Texas, which includes 167,934,720 acres, less than 5 per cent more than the National Forests. Indicative of the economic importance of the National Forests, the cash receipts from sale of timber, grazing privileges, etc., amounted to over \$6,000,000 in the same period. Receipts from timber sales increased over \$783,000 above those of the preceding year. A total of 18,825 acres were replanted with young forest stock, raised in the National Forest nurseries, with the expectation of greatly expanding this activity in the future so as to render productive the millions of acres of cut-over lands now yielding little or no valuable timber and, in many instances, subject to destructive erosion. Purchases of forest lands in the states east of the Mississippi were increased, important accessions being made to the National Forests in Pennsylvania, Georgia, and New Hampshire, in some instances with a view to better protection of water sheds of important streams and in other cases the preservation of scenic areas for the benefit of present and future generations.

**STATE AND MUNICIPAL FORESTS.** According to the official record of the U. S. Department of Agriculture of Apr. 25, 1929, the total area of State forests was at that time 6,558,735 acres and of municipal and county forests 726,577 acres, presenting concrete evidence of the growing importance of this phase of forestry. New York State, with its large Adirondack and Catskill public forests, amended its laws to permit the purchase of new areas outside these forests. Indiana, New Jersey, Ohio, South Carolina, and Vermont authorized forest land purchases or the acceptance of gifts of such properties. Tax legislation

was enacted by Connecticut, North Carolina, Maine, Idaho, Minnesota, and Oregon, making it easier for private owners to carry forest lands during the growing stage, thus encouraging reforestation and the holding of forest crops until mature.

**RESEARCH AND EDUCATION.** No better sign of the improved public attitude toward scientific forestry is needed than that of the very material progress along research and educational lines. The regional forest experiment station programme begun by the U. S. Department of Agriculture in 1921 and now well under way, with stations already established in most of the important forest areas, has been a most notable undertaking and one that is already showing profitable returns. The equipment of each station with a well-balanced staff of technical workers is in process with the objective in view of being able to attack problems from all angles. Concrete results are already forthcoming and it is quite evident that this systematic research plan is going to be a mighty factor in the advancement of forestry in the near future.

Forest economics received greater consideration in 1929 in the realization that the development of sound forestry on our land uses must be founded on scientific principles and forces. A nation-wide forest survey was undertaken by the U. S. Forest Service to secure an accurate, detailed, and comprehensive appraisal of the national resources at present and probable developments in the future. Forest product investigations at the laboratories at Madison, Wisconsin, and in the field continued to yield important results, especially in the utilization of inferior tree species, of lower grades of lumbers, and in the preservation of wood.

Research in private institutions also progressed favorably. Yale University was the fortunate recipient of a fund of more than \$200,000 donated by the well-known benefactor of forestry, Charles Lathrop Pack, as a foundation for the advancement of applied forestry. Oregon State College received a gift of 2400 acres of cut-over forest land in Columbia County to be used in research and teaching. At the University of California, a change was made in the curriculum of the forest school, providing for the degree of doctor in forestry.

A considerable increase in student enrollment in forestry schools throughout the country gave promise of an abundant trained personnel for the future. The State School of Forestry at Mont Alto, Pa., was combined on June 15, 1929, with the forestry department at Pennsylvania State College as a step in strengthening and coordinating the forestry education work of the State.

**MISCELLANEOUS.** The seventh congress of the International Union of Forest Experiment Stations was held in Stockholm, Sweden, July 21-27, under the presidency of Henrik Hesselmann, well-known head of the Swedish Forest Experiment Institute. Among Americans attending were E. N. Munna, Joseph Kittledge, Jr., and Alfred Stamm of the U. S. Forest Service, and Professor James W. Toumey of the Yale School of Forestry. Important progress was made in providing for an international forestry congress.

William T. Cox and Dr. J. M. Matthews were employed by the Brazilian government to organize a federal forest service for the care of the immense forest areas of Brazil, approximating a billion acres in extent and containing vast quantities of valuable timber.

**BIBLIOGRAPHY** Among the more notable publications in the field of forestry which appeared during the year were I W Bailey and H A Spoehr, *The Role of Research in the Development of Forestry in North America* (New York, 1929), I J Craih, "Some Aspects of Soil Moisture in the Forest," *Yale Forest School Bulletin*, No 25, 1929, S A Graham, *Principles of Forest Entomology* (New York, 1929), R C Hawley, *The Practice of Silviculture* (2d ed., New York, 1929), D F Holtman, *Wood Construction—Principles, Practice, Details* (New York, 1929), and J. R. Smith, *Tree Crops. A Permanent Agriculture* (New York, 1929).

#### FORESTS, NATIONAL SEC FORESTRY

**FORMOSA or TAIWAN.** An island belonging to Japan off the Chinese Province of Fukien, formerly belonging to China but ceded to Japan, May 8, 1895 Area, 13,880 square miles, excluding the adjacent Hokoto or Pescadores Islands, which have an area of 48 square miles. The population in 1926 totaled 4,241,750, of whom 3,923,752 were natives, 195,769, Japanese, 86,733, aborigines, and 35,505, foreigners. In the same year, there were 183,360 births, 93,720 deaths, and 46,778 marriages. Capital, Taihoku, with a population of 195,550 in 1925. Other large towns are Tainan, Kagi, and Taichu. In 1926-27 there were 132 primary schools for the instruction of Japanese, with 780 teachers and 25,895 pupils, and for the instruction of the natives there were 529 schools with 6154 teachers and 216,011 pupils.

Formosa produces in commercial quantities nearly every tropical, subtropical, and temperate-zone product. The island supplies all the world's Oolong tea and produces nearly all the world's natural camphor. The sugar industry, however, is the most important. The production of raw sugar amounts to more than 1,000,000,000 pounds annually. The entire output is shipped to Japan, with the exception of that used in local consumption and an inferior grade shipped to China. The production of tea averages about 21,600,000 pounds annually, of which the United States takes about 10,000,000 pounds. The yield of rice is over 25,000,000 bushels. Indigo, hemp, pineapple, grapefruit, papaya, sweet potatoes, peanuts, beans, cereal, and ramie are also important crops. Gold, silver, and copper are mined in considerable quantities, and coal and sulphur are exported. Some petroleum has been found. The exports to foreign countries in 1928 were valued at \$3,895,688 yen and the imports at \$8,333,729 yen. Imports from Japan in the same year totaled 132,318,204 yen and exports to Japan, 214,521,597 yen (1 yen equals \$0.4984).

The revenues and expenditures of Formosa have grown enormously under Japanese rule and at the present time amount to about 100,000,000 yen annually. The budget has never shown a deficit. Revenues and expenditures for the fiscal year beginning Aug. 1, 1929, were estimated at 126,125,881 yen. The principal expenditures are for communications and transportation, for the management of the Government's monopolies, for forestry, and for maintenance of various administrative bureaus. The island is under a governor-general, who is supported by a well-organized force of Japanese police. A frontier zone, marked for a considerable distance by charged barbed wire, is maintained to prevent raids by

the as yet unsubdued aborigines. The Governor-General in 1929 was Takeji Kawamura.

#### FOUGITA COLLECTION. See ART SALES

**FOUNDATIONS.** With deep and difficult foundations almost a matter of every-day routine of modern engineering construction, one would be led to believe that there was little opportunity for invention or improvement. The degree of standardization and the complete control which have been achieved in the pneumatic process, for example, is certainly extraordinary. Hardly a year passes in which the limit record for pressure or depth in pneumatic work is not touched—a limit which is set by human ability to withstand pneumatic pressure. This year a pressure of 52 pounds per square inch was reached in the construction of the piers of the Vicksburg Bridge (see BRIDGES). In 1928 it was a bridge in Maine. Yet the development during the year under review of a modification of the so-called "air-lift" process into an ingenious combination of dredging and cofferdam construction shows clearly that every new foundation project presents its own problems and that there is still ample room for the ingenious man in modern construction.

**STEEL CYLINDER FOUNDATIONS.** A novel and interesting form of construction was used in founding the piers for two long highway bridges completed in 1929 for the Florida State Highway Department over arms of St. Andrews Bay on the Gulf coast. Some 56 steel cylinders of 16-foot diameter, ½ inch thick, and reinforced every 5 feet with angles, and two cylinders of 30 feet in diameter were sunk in deep water. The cylinders were shipped in quarter-section rings. They were riveted to form full circles and were lowered between timber guide pile frames from special supports erected over the pier locations. Section by section was added as the lowering progressed until the tube rested on bottom. Excavation was then carried on inside each tube by derrick, bucket and jetting until the tube sank to final position. Piles were then driven in the bottom, 50 feet under water, by means of an under-water steam pile hammer working from special leads. Concrete was deposited around the piles by tremie tube so as to seal the bottom of the tubes and sufficient in depth to counterbalance external pressure. The cylinders were then unwatered, the projecting pile-tops cut off and the rest of the cylinders were concreted in the div. Each pier was joined of two of these cylinders, the concrete shafts above water being connected together with a concrete web wall with a concrete cap over all.

**CAISSON ACCIDENTS.** A fatal accident occurred in sinking the pneumatic caisson for Pier 10 of the Cooper River Bridge under construction at Charleston, S. C., on Dec. 1, 1928. Unfortunately, one of the guide piles, used in holding the caisson in position while it was being sunk, had not been driven vertically but had deflected into the caisson area. This condition was unknown to the contractor and when the caisson was sunk, one edge was held up by this pile. Air was put on in the working chamber of the caisson and excavation was under way when the caisson suddenly tilted about 15 degrees. The workmen all escaped. Later, however, when the caisson had shown no further movement and while the true cause of the trouble had not yet been discovered, excavation was again started in the working chamber under the high side of the caisson. Another sudden list

of about 11 degrees additional occurred, and seven men were trapped under the caisson and killed. The caisson was later refloated, the difficulty remedied, and it was successfully sunk in position.

The sudden failure of a welded connection between the shaft and an air lock in a pneumatic caisson caused the loss of six lives on the Hackensack River Bridge near Jersey City, N. J. The caisson was being used in sinking a pier for this Pennsylvania Railroad-State of New Jersey highway structure. When the air pressure failed, the caisson suddenly settled or dropped, and the men were smothered in the river mud below.

**FOUNDATIONS, EDUCATIONAL.** See **UNIVERSITIES AND COLLEGES**.

**FOWLER, ELLAN THORNEYCROFT** (MRS. A. L. FELKIN). English novelist, died June, 1929, in Bourne-mouth, Hampshire. She first wrote short stories and poetry (*Verses Grave and Gay*, 1891; *Verses Wise or Otherwise*, 1895; *Cupid's Garden*, 1897), but her initial success was a novel, *Concerning Isabel Carnaby* (1898). Among her many works are *A Double Thread* (1899), *The Farringtons* (1900), *Fuel of Fire* (1902), *The Wisdom of Polly* (1910), *Her Ladyship's Conscience* (1913), *Beauty and Bands* (1920), *Signs and Wonders* (1926).

**FOWLS, FOWL DISEASES, ETC.** See **LIVESTOCK, VETERINARY MEDICINE**.

**FRANCE.** A republic of western Europe, lying between 42° 20' and 51° 5' north latitude and 7° 45' and 4° 45' west longitude. Capital, Paris.

**AREA AND POPULATION.** The area before the World War was 207,054 square miles, total area in 1928, 212,659 square miles. The additions obtained under the Peace Treaty, and corresponding to Alsace-Lorraine under the German Empire, comprise the new departments of Bas-Rhin, 1848 square miles, Haut-Rhin, 1354 square miles, and Moselle, 2403 square miles. According to the census of 1926, the population was 40,743,851, but not including 178,534 citizens comprising the military and naval forces and the crews of merchant ships abroad. The estimated population in 1928 was 40,920,000, in 1921 it was 40,209,518. During the period 1924-28, the average number of births was 758,804, and of deaths, 690,257. In the same period, foreign workers entering the country outnumbered those who left by 426,652. The cities with a population of over 200,000 at the census of 1926 were as follows: Paris, 2,871,429; Marseilles, 652,106; Lyons, 570,840; Bordeaux, 256,026; and Lille, 201,921.

**EDUCATION.** Primary education is free and compulsory between the ages of 6 and 13. Statistics for 1926-27 showed 3690 public and private infant schools, with 393,652 enrolled pupils, and 80,183 public and private primary schools, with 3,853,431 enrolled pupils. In November, 1926, there were 282 higher elementary schools for boys and 209 for girls. The numbers of pupils were 37,900 boys and 36,680 girls. Secondary education is provided by *lycées* supported by the state, colleges supported by the communes, and free schools supported by individuals and associations. In November, 1927, there were 125 *lycées*, with 74,492 pupils, and 237 communal colleges for boys in France and Algeria, with 39,004 students, and 205 secondary schools for

girls, with 52,459 pupils. Higher education is supplied by the state universities, special schools under the direction of the state, and various private schools and faculties. On July 31, 1927, 60,969 students were enrolled in the 17 universities and professional schools, distributed as follows: law, 17,125; medicine, 11,182; sciences, 12,820; letters, 13,343; pharmacy, 3300; schools of medicine and pharmacy, 2944; theology, 255.

Other institutions dependent upon the Ministry of Public Education include Collège de France, Museum of Natural History (which gives instruction in the sciences), Practical School of Higher Instruction, with its seat at the Sorbonne, offering courses in history, philology, and science, Ecole des Beaux Arts, and various others. Dependent upon the other ministries are various institutions of technical instruction, including schools of commerce, agriculture, mines, forestry, military and naval science, etc., and finally, there are numerous technical schools of a lower grade dependent upon the Ministry of Public Instruction.

**AGRICULTURE.** About 40.8 per cent of the total land area of France (54,823,000 acres) was devoted to crops in 1927. Of the remaining area, 28,158,000 acres were used for permanent meadow and pasture, 5,796,000, for orchards and vineyards, 25,841,000 were covered by woods, and 11,315,000 were waste and uncultivated land. The area and production of the chief crops in 1927 and 1928 are shown in the accompanying table from the *Commerce Year Book*.

CROPS AREA AND PRODUCTION

	Area (thou sands of acres)		Production (thousands of units—bushels except as indicated)	
	1927	1928	1927	1928
Wheat	11,065	12,795	276,126	277,655
Rye	1,921	1,949	31,957	35,362
Barley	1,747	1,817	50,328	53,102
Oats	8,544	8,572	343,282	336,257
Corn	861	844	20,721	14,559
Potatoes	3,709	3,619	64,194	400,240
Sugar beets	590	588	6,002 *	5,368 *
Beet sugar			850 *	881 *
Grapevines	3,393	3,417	1,300,399 *	1,543,161 *

\* Unit, metric ton

\* Unit, gallon of wine

The value of the principal crops in 1927 was as follows: Wheat, \$439,000,000; rye, \$411,000,000; oats, \$206,000,000; barley, \$53,000,000; potatoes, \$245,000,000; grape vines, \$371,000,000. Cultivation of olives, hay, flax, fodder beets, green forage, and fruits also is extensively practiced. Crops were only fair in 1928 due to dry weather and the unsatisfactory condition of the farmers grew more marked as prices continued to decline. In 1929, however, the agricultural situation was reported improved, with the prices of foodstuffs advancing and most of the crops showing good yields. Silk culture is carried on with assistance from the government in 24 departments of France, the total production in 1928 being 2,671,000 kilogrammes, valued at 52,399,000 francs, as compared with 3,556,000 kilogrammes, valued at 74,728,000 francs in 1927. On Jan. 1, 1928, there were 2,927,230 horses, 182,720 mules, 259,800 asses, 14,940,960 cattle, 10,693,120 sheep, 6,019,450 swine, and 1,405,050 goats.

**MINING.** With the exception of coal, the total output of which dropped slightly in 1928, virtually all of the other minerals produced in France

showed an increased production in 1928, as compared with 1927, as indicated in the accompanying table

#### MINERAL AND METAL PRODUCTION (Thousands of metric tons)

	1927	1928
Coal and lignite	52,848	52,428
Coke (metallurgical)	4,044	4,404
Briquets	8,900	4,068
Iron ore	45,672	49,332
Iron pyrites	204	202
Potash (K <sub>2</sub> O content)	372	410
Bauxite	540	598
Pig iron	9,298	10,096
Steel (ingots and castings)	8,275	9,384
Iron and steel (finished products)	5,102	

Lower consumption and more severe foreign competition forced the coal mines to cut down their production, personnel, and accumulated stocks in 1928. Toward the end of the year, conditions improved and in 1929 the situation of the leading coal companies became unusually favorable, with profits high and orders numerous. Iron-ore extraction in 1928 exceeded the record 1927 production by 8 per cent and exports increased in even greater ratio, going principally to Belgium, Luxembourg, Germany, and the Netherlands. Potash production reached a new peak in 1928 and the production of bromine, a comparatively recent industry, was 50 per cent greater than in the preceding year.

MANUFACTURES. As indicated in the accompanying table from the *Commerce Year Book*, manufacturing industries on the whole had a favorable year in 1928, the output of most important manufactures showing considerable gains over 1927 and 1926. In the iron and steel industry, production was greater, domestic consumption larger, and prices remunerative, although exports decreased slightly and production costs were higher. The shipyards were only slightly more active than in 1927, few new vessels being produced despite a government subvention to ship companies of 1,000,000,000 francs, to be distributed in five annual installments. Metal-working industries and automobile factories made fair profits, cotton- and wool-textile

cent for men and 8 per cent for women in 1928.

COMMERCE. The value of exports continued the tendency of the previous two years and declined by more than 6 per cent in 1928, while the value of imports increased by less than 1 per cent. Imports for consumption were valued at 53,448,000,000 francs (\$2,095,000,000) in 1928, as compared with 53,050,000,000 francs (\$2,080,000,000) in 1927. Domestic exports were valued at 51,347,000,000 francs (\$2,013,000,000) in 1928 and 54,925,000,000 francs (\$2,153,000,000) in 1927. Comparison of 1928 trade figures with former years is materially affected by the exclusion from 1928 statistics of pearls and precious stones imported on consignment and returned when not sold. France's heavy "invisible" balance of trade, resulting from expenditures by thousands of foreign tourists, was variously estimated by French authorities at from 9,000,000,000 francs (\$353,000,000) to 10,000,000,000 francs in 1928. The expenditures of American tourists in that year were estimated \$200,000,000. In 1929 there was a decrease of about \$40,000,000 in American-tourists' expenditures and the amount spent by other foreigners in France declined in about the same ratio. In the same year, the unfavorable visible balance of trade was 8,212,000,000 francs, as against 2,000,000,000 francs in 1928. The figures for 1929 were: Imports, 58,284,624,000 francs (\$2,331,384,000), exports, 50,072,348,000 francs (\$2,002,893,000).

Wheat imports in 1928 were about half those of 1927, purchases of manufactured articles increased about 30 per cent, and raw materials imported remained about the same as in the previous year. Raw wool and cotton imports declined considerably in quantity but increased in value. Coal and meat imports declined in quantity and value, while petroleum products, crude copper, machinery, automobiles, chemicals, hides and skins, sawn wood, and table fruits increased in both quantity and value. Among the exports, wool and silk fabrics increased in value and weight, and those of cotton fabrics decreased in value, along with iron and steel and automobiles. Exports of various metal manufactures declined in weight but remained about the same in value.

#### MANUFACTURING PRODUCTION

Product		1926	1927	1928
Silk (conditioned at Lyons)	1000 lbs...	14,577	12,751	15,609
Wool (conditioned at Roubaix-Tourcoing)	1000 lbs.	223,864	229,049	236,271
Wool (conditioned at Marseilles)	do	46,006	55,397	59,704
Cotton consumption *	do	770,740	721,343	692,240
Cotton cloth	million yds	1,356	1,355	1,387
Artificial silk	metric tons	11,500	15,000	17,000
Boots and shoes (estimated)	1000 pairs	80,000		75,000
Alcohol	1000 gals.	39,217	44,847	56,989
Vessels launched	gross tons	121,342	44,386	81,416

\* Including waste

plants experienced a less satisfactory year than in 1927, while the demand for silk products improved, and there was an increase in practically all chemical products.

In 1929 industrial conditions remained generally satisfactory. A lessening of activity in iron and steel, automobiles, shipping, and a few other branches was attributed to the disturbed internal political situation, uncertainty over the reparations settlement, and nervous world-wide commodity and security markets. There was a shortage of industrial workers in France in 1928 and 1929, the total number of unemployed on Nov. 30, 1929, being only 677, as compared with 895 on Dec. 31, 1928. Wages increased 4.5 per

Machinery exports, and sales of chemicals, dyes, fertilizers, perfumery and soaps, skins, and hides were higher, but sales of leather manufactures declined in both weight and value.

The United States remained the leading source of origin of French imports in 1928, although the percentage of American imports fell from 13.3 per cent of the total in 1927 to 11.6 per cent. In 1929 imports from, and exports to, the United States increased, totaling \$285,655,805 and \$171,490,548, respectively. The value of American imports was \$243,000,000 in 1928 and \$277,000,000 in 1927. Great Britain, Germany, Belgium-Luxembourg, Algeria, and Argentina, in the order named, were the leading sources of imports. Great

Britain was the heaviest purchaser of French exports, taking 15.9 per cent, followed by Belgium-Luxemburg, Germany, Algeria, and Switzerland. Exports to the United States in 1928 were valued at \$131,000,000, as compared with \$142,000,000 in 1927. A feature of the year's trade was the important decline in trade with, and particularly in exports to, Great Britain. There was a large increase in imports from Germany and an even greater decrease in exports to that country. In the colonial trade, the export surplus was larger in 1928 than in the previous year, while trade with foreign countries showed a large excess of imports. The colonies and protectorate supplied 12.6 per cent of the imports in 1928, as against 12.4 per cent in 1927, and took 16 per cent of the exports, as compared with 14 per cent in 1927.

**FINANCE** Preliminary estimates of the Finance Minister for the 1930 budget placed receipts at 48,722,000,000 francs and expenditures at 48,000,000,000 francs. These figures, however, were considerably revised during the parliamentary debate on the budget, in which the proposed expenditures were raised 342,000,000 francs and the proposed revenue was reduced by 417,000,000 francs. Chief items of expenditure in the Finance Minister's proposals were for debt service, 13,500,000,000 francs, pensions and related payments, 9,027,000,000 francs, national defense, 8,732,000,000 francs, instruction and arts, 3,250,000,000 francs, public works, 2,033,000,000 francs. The government placed expenditures on the home army for 1930 at 4,500,000,000 francs (\$180,000,000), for the defense of colonial possessions at 1,750,000,000 francs (\$70,000,000), for the navy, 2,583,000,000 francs. The opposition deputy, Edouard Daladier, however, calculated that the expenditures for the army alone would amount to 8,450,000,000 francs (about \$338,000,000) and that exceptional military expenditures would bring the real army budget to 14,000,000,000 francs, not counting 2,000,000,000 for civil services connected with the army.

The budget also contained an item of 30,000,000 francs (\$1,200,000) for "the encouragement of tourists," 700,000,000 for public roads, 630,000,000 for port extension, 400,000,000 for combating tuberculosis, and 500,000,000 for the construction of public schools. Another appropriation of 50,000,000 francs was for the creation of a broadcasting system to end, so far as possible, the "intellectual isolation" of the country districts. In connection with the debate on the 1930 budget, Premier Tardieu presented a bill changing the date for the beginning of the financial year from January 1 to April 1. The change, which had been advocated by Finance Ministers for over a century, was intended to end the difficulty now experienced in getting the budget approved during the extraordinary session of November and December. M. Tardieu supported the adoption of the measure for 1930 by pointing out that the surplus from 1929 and other funds held by the Treasury would be sufficient to meet all expenditures during the first three months of 1930. Actual revenues of the general budget in 1929 totaled 47,800,000,000 francs, of which 47,100,000,000 were derived from normal and permanent sources.

Receipts for 1929 were estimated at 45,430,717,000, and expenditures, at 45,366,000,000, francs. In 1928 the actual revenues were 53,294,-

000,000 francs, or 11 per cent more than estimated in the budget, and the expenditures were 42,455,000,000 francs. Increases in the 1929 estimated receipts over those for 1928 resulted from the inclusion in the latter budget of 1,000,000,000 francs, representing the net amount anticipated from reparations payments and of 529,000,000 francs, representing the expected repayments of advances made to posts, telegraphs, and telephones (see **YOUNG PLAN, REPARATIONS**). The original proposals for the 1930 budget showed substantial increases in both receipts and expenditures over the 1929 estimates. Provision was made for the reduction of taxes through raising the income-tax limit and the lowering of luxury and other taxes and registration charges. Higher tax yields were expected to result, however, from an increased volume of business and the budget again included 1,000,000,000 francs from reparations payments. The revenues estimated in the general budgets for 1929 and 1930 and their sources are shown in the accompanying table.

#### RECEIPTS IN FRENCH GENERAL BUDGETS

[In millions of francs]

	1929, (esti- mated)	1930, (pro- posed)
Direct taxes and centimes, d'Etat	9,636	9,802
Registry dues, transfers of property, etc.	3,709	4,257
Stamp taxes	1,893	2,019
Tax on revenue from securities	3,524	3,623
Customs	4,277	5,041
Excises	6,552	6,588
Business turnover tax	7,480	8,365
All other taxes	2,574	3,121
State monopolies (gross)	464	460
All other receipts	5,523	5,436
<b>Total</b>	<b>45,431</b>	<b>48,722</b>

The distribution of expenditures in the 1930 budget, with comparative figures for 1929, is shown in the accompanying table. The internal debt on Dec 31, 1928, stood at 288,055,000,000

#### EXPENDITURES IN FRENCH GENERAL BUDGETS

[In millions of francs]

	1929, (esti- mated)	1930, (pro- posed)
Debt service	15,007	13,506
Pensions and related payments	8,119	9,027
National defense	8,231	8,752
Instruction and arts	2,941	3,250
Public works	2,074	2,033
Collecting revenue (including gross expenditure and monopolies)	1,197	1,193
All other expenditures	7,594	10,905
<b>Total</b>	<b>45,366</b>	<b>48,666</b>

francs. The external debt was divided as follows: United States Government, \$2,912,000,000, United States, commercial debt, \$673,000,000, British Government, £710,000,000, Great Britain, commercial debt, £1,000,000. The total debt, in dollars, was \$14,770,000,000, as compared with \$15,097,000,000 on Dec 31, 1927. At the end of 1929, the gold reserve of the Bank of France was larger by 9,500,000,000 francs, or 37 per cent, than at the end of 1928, and larger by 12,700,000,000, or 44 per cent, than at the date of official stabilization in June, 1928.

**COMMUNICATIONS** The length of railway line in operation in 1927 was 26,876 miles, of which 6905 miles were state owned. Passengers carried

by all railways during the year numbered 746,037,000, by state railways, 253,298,000, gross receipts of all railways, 13,534,000,000 francs, of state railways, 3,004,000,000 francs. The state owns the seven large railway systems of the country, operating the Northwestern and the Alsace-Lorraine systems and leasing the remaining five to private companies. In 1928 railway receipts were 121 per cent above the previous year, the gain being largely due to a 119 per cent increase in rates on Mar. 1, 1928. Only two of the seven state-owned railways reported deficits in 1928.

Extensions to several of the main-line railway stations in Paris were made and a new railway line from Toulouse to Barcelona, entering Spain through the valley of the Cerdagne, was formally opened in 1929. The line is the second to be completed of three railways across the Pyrenees provided for in a convention signed in 1904 between France and Spain. The first of these, between Pau and Saragossa, was opened in the fall of 1928. Work on the third, between Leida and Saint-Giron, was progressing slowly. The Toulouse-Barcelona line was being built five miles beyond Barcelona to the new Free Port under construction at the mouth of the Llobregat River. Here, goods may be loaded on French trains and pass through Catalonia to France without interference on the part of the Spanish Customs.

The total length of roads in 1927 was 381,820 miles, of which 24,441 miles were state highways and 7555 miles, departmental. The remainder were maintained by the communities through which they pass. The length of navigable rivers and canals in 1926 were 6585 miles, the total traffic amounting to 48,121,000 metric tons in 1928, as compared with 41,852,000 tons in 1927. Vessels entering the ports of France in 1928 totaled 28,299 of 52,302,000 registered tons and clearances totaled 25,434 vessels of 40,419,000 registered tons. Both entrances and clearances showed increases over 1927. The French merchant marine on June 30, 1928, consisted of 1682 vessels of 3,344,465 gross tons.

Some phases of civil aviation showed a decline in 1928, the number of passengers carried dropping from 21,000 in 1927 to 19,549 in 1928 and the express carried decreasing from 2,755,000 pounds to 2,545,000 pounds. The distance flown by planes increased from 3,753,000 miles in 1927 to 4,180,000 miles. The 1929 budget contained a large appropriation for the extension and improvement of aviation.

**ARMY** The French Army is divided into two forces, the metropolitan, comprising the active army, reserves, and territorial army, and the colonial forces, both are under the War Ministry. The active metropolitan army in 1928 numbered 413,578, including the air-force establishment of 32,886. In addition to the metropolitan army is on a compulsory basis, but liberal exemptions are allowed. The term of service was reduced from one and one-half years to one year, effective in 1930. In 1928 white troops in the colonial army numbered 48,951, in the Foreign Legion, 10,000, and colored troops, 110,000, making, with the metropolitan army, a total peace force of 672,122.

**NAVY** For an account of naval conditions in France, see **NAVAL PROGRESS**.

**GOVERNMENT** According to the French Constitution, the President is the executive, assisted

by a cabinet responsible to the Chamber. The legislative power is vested in the Parliament, or National Assembly. The President, who holds office for seven years, is elected by an absolute majority of votes in the Senate and Chamber of Deputies, and he chooses his cabinet ordinarily from among the members of the two. The Senate is made up of 314 members not less than 40 years of age and elected by an electoral college for nine years, one-third retiring every three years, the Chamber of Deputies is made up of 612 members elected by direct popular manhood suffrage for four years. The composition of the Chamber elected Apr. 22-29, 1928, was as follows: Communists, 16, Democrats, 22, Independent Radicals, 64, Left Republican Democrats, 34, Socialists, 104, Radicals and Radical Socialists, 110, Republican Socialists and French Socialists, 46, Republicans of the Left, 94, Democratic Republican Union, 110, Conservatives, 12.

President in 1929, Gaston Doumergue, elected July 24, 1924. The Ministry appointed Nov. 11, 1928, consisted of: Prime Minister, Raymond Poincaré, Deputy Prime Minister and Minister of Justice, M. Louis Barthou, Finance, Henri Chéron, Interior, André Tardieu, War, Paul Painlevé, Marine, Georges Levesque, Foreign Affairs, Aristide Briand, Colonies, André Maginot, Public Instruction and Fine Arts, Pierre Mairaud, Public Works, Pierre Forget, Commerce, Georges Bonnet, Agriculture, Jean Hennessy, Labor, Hygiene, Assistance, and Social Prevention, Louis Loucheur, Pensions, Louis Antonietti, Air, Laurent Eynac.

**HISTORY** The governmental stability which characterized France under the firm rule of the Poincaré National Union ministry, 1926-28, gave way in 1929 to repeated cabinet crises similar to those which brought France to the verge of ruin in 1926. Three successive cabinets functioned during the year under the constant threat of defeat, with consequent unfavorable repercussions in foreign and domestic affairs. The realignment of parties which paved the way for the return of governmental instability took place with the withdrawal of the Radicals from the Poincaré ministry in November, 1928, and the consequent reconstitution of the cabinet (see 1928 **NEW INTERNATIONAL YEAR BOOK**). The Radicals made repeated attempts to overthrow the new Poincaré government, the first of these on January 11 in connection with articles in the budget providing for the restoration of certain rights withdrawn from missionary societies in 1901 and 1904. The Premier won a vote of confidence by a majority of 74, his support coming mainly from the Right groups. Again, on February 19, he won by the close vote of 291 to 285 on an important question of judiciary reforms. With the reparations problem then under discussion in Paris by the experts, the cabinet situation was deplored as weakening France's position.

In March, the cabinet withstood repeated attacks on the question of the religious-orders bill, the treatment of French soldiers on duty along the Rhine, and other issues. A bitter debate, which apparently marked the resumption of the religious controversy over the so-called lay laws of 1901 and 1904, occurred in connection with the preliminary vote authorizing missionary societies to resume recruiting in France and to establish headquarters there in which to train their recruits. Reassembling May 23 after the Easter recess, the Opposition forced a vote of confidence

## TWO FRENCH STATESMEN

on the vigorous measures taken by M. Tardieu, Minister of the Interior, to prevent May Day demonstrations in Paris. The Government was again upheld by a vote of 320 to 258.

On July 21, M. Poincaré achieved the final step in his programme for the rehabilitation of French finances, when the Chamber of Deputies ratified the Mellon-Béranger debt agreement with the United States and the Churchill-Carillaux debt agreement with Great Britain by 300 to 292 votes. The Mellon-Béranger agreement was entered into on April 29, 1926, and provided for the payment of the entire debt of the French government to the United States over a period of 62 years, the average interest rate to be 2.17 per cent. This represented the cancellation of about 52 per cent of the entire amount of the French funded debt, if calculated upon the basis of  $\frac{4}{5}$  per cent as the cost of the money to the United States. The funded principal of the debt was fixed at \$4,025,000,000, of which \$1,070,000,000 consisted of cash loans contracted before the Armistice, and \$1,027,000,000 of cash loans advanced after the Armistice. Some \$407,000,000 represented the French debt incurred through the purchase of war supplies left in France by the American Expeditionary Forces, the original cost of which was about \$1,739,000,000. The remainder represented accumulated interest.

Under the agreement governing the purchase of the war supplies, the \$407,000,000 debt was due Aug. 1, 1929. The failure to ratify the Mellon-Béranger agreement left France faced with the alternative of being forced to pay this debt immediately or being declared in default. The question of ratification was heatedly debated as the time limit for payment of the war-stocks debt drew near. The problem was confused by the fact that the Young Plan for reparation payments was then before the various governments for ratification. The French generally hesitated to ratify the debt accords with the United States and Great Britain before the Young Plan had been accepted by the governments concerned. Premier Poincaré, former Premier Joseph Caillaux, M. Béranger, and other influential Frenchmen joined in the plea for immediate ratification of the debt accords, but the Chamber, on June 27, requested the Premier again to attempt to persuade the American Government to allow the postponement of the payment on the war-stocks debt beyond August 1.

The United States Government, lacking the authority to acquiesce without the consent of Congress, was compelled to refuse. On July 16, Poincaré was upheld by a vote of 304 to 239 when he opposed a motion to postpone discussion of the debt ratifications until the reparations problem had been generally settled. M. Poincaré presented the case in favor of immediate ratification in a two-day speech before the Chamber. The debates preceding the final vote showed that a considerable section of French opinion considered the debt payments contingent on the payment of German reparations, but there were no reservations attached to the resolution for ratification. On December 16, the Mellon-Béranger agreement was ratified by the United States Senate after a debate of only an hour and a half, by a vote of 53 to 21. The bill for ratification was signed by President Hoover December 18. The annual payments provided for under the agreement with the United States were \$30,000,000 in the first year (1935), and ranged upward to \$125,000,000

annually during the seventeenth to sixty-first years. With interest, total payments were placed at \$6,847,674,104.

His task completed and his health impaired by his labors, Poincaré resigned on July 26. Aristide Briand was called to form a new cabinet. As the Radical Socialist leaders, such as M. Herriot and M. Daladier, refused to participate, he decided on July 29 to go ahead with the old cabinet, he himself filling the posts of Prime Minister and Foreign Minister. His cabinet was not conceded a long lease of life, but he went to The Hague Reparations Conference with the backing of virtually all groups in Parliament on his foreign policy. (For developments at The Hague, see REPARATIONS.) Before the League of Nations Assembly on September 5, M. Briand made an eloquent plea for a "Federated Europe."

The Briand cabinet met sudden defeat on the opening day of Parliament (October 22), a snap vote on procedure resulting in an anti-government majority of 11. Dissatisfaction with the terms of the Young Plan, the popular belief that M. Briand at The Hague had bartered away French occupation of the Rhineland for a doubtful reparations promise on the part of Germany and before the French eastern fortifications programme had even begun, and a collapse in agricultural prices due to overproduction combined to cause his overthrow. There was also resentment at the concessions Briand had made to Britain at The Hague. President Doumergue first called Edouard Daladier, leader of the Radical Socialists, to attempt the formation of a cabinet, but he was unsuccessful, as the Socialists refused to cooperate. Senator Etienne Clémentel also failed to form a government of the Centre with Left support.

While the cabinet crisis continued, a number of important problems awaited solution. The putting into effect of The Hague agreements, including evacuation of the Rhineland, the approaching negotiations with Germany for the return of the Saar, the question of the International Bank and the five-power London naval conference in January with the allied question of Franco-Italian naval parity in the Mediterranean—all were pressing for attention. Finally, on October 1 a new ministry of the Centre and Right was formed by André Tardieu, a member of the Centre, who assumed the Premiership in addition to holding his former post as Minister of the Interior. M. Briand remained as Foreign Minister. The principal change was the appointment of André Maginot as Minister of War in place of Paul Painlevé who had been criticized for neglecting the eastern fortifications. The other members of the cabinet were: Minister of Finance, Henri Chéron; Marine, Georges Leygues; Agriculture, Jean Hennessy; Labor, Louis Loucheur; Posts, Germain Martin; Aviation, Laurent Eynac; Public Instruction, Pierre Marraud; Colonies, François Pietri; Commerce, Pierre Flandin; Pensions, M. Gallet; Public Works, Georges Perrot; Merchant Marine, Louis Rollin; Justice, Lucien Humbert.

On November 9, the Tardieu cabinet survived two tests: votes on domestic and foreign policies by majorities of 71 and 79. M. Tardieu, in outlining his policies, gave assurance to the Right that the evacuation of the Rhineland would not be completed until the Young Plan had been ratified by Germany and pledged himself to the continuation of Briand's foreign policies. Fortifica-

tion of the eastern frontier would be pushed faster, and adequate protection of France and her communication lines with her colonies insisted upon at the London Naval Conference. With regard to internal measures, he announced that measures calculated to benefit agriculture and improve social and general economic conditions would be undertaken out of the large treasury surplus. Tax reductions totaling 1,149,000,000 francs (\$46,000,000) were voted December 26, to become effective January 1.

The unexpectedly large majorities given the Government's programme and the favorable impression made upon the Chamber by the new Premier aroused hope that his cabinet would have a longer tenure than those of his immediate predecessors. A firmer tone in France's foreign policy became immediately apparent. On December 26, the Government made public a memorandum sent to the Powers a few days previously in which the principles which would guide the French delegates at the forthcoming London Naval Conference were outlined in detail.

The memorandum stipulated that any agreements arrived at in London must be within and subservient to the framework of the League of Nations' general disarmament plans, declared that, without other provision for enforcement than the force of public opinion, the Kellogg-Briand Pact could not be regarded as a guarantee of the security of nations, and announced that French naval needs must be established upon the requirements of the "French empire" and not upon the mathematical ratios set forth by the Washington Conference. Finally, the memorandum submitted definite French proposals for a Mediterranean naval accord to include Great Britain, Italy, France, and Spain. The memorandum, which appeared to preclude a general five-power reduction of armaments at the London Conference, evoked considerable criticism in the United States and Great Britain. It was indicated that, without assurances of security through an international agreement, France was not willing to reduce her naval programme, which provided for a naval tonnage of 800,000 tons by 1942, without capital ships, which the French admiralty regarded as obsolete.

On December 26, Foreign Minister Briand again overcame violent attacks from the Right upon his policy of peace. The following day, upon Premier Tardieu's refusal to withdraw his support from the policies of his Foreign Minister, the Premier received an overwhelming majority of 342 to 17 for the Government's programmes at The Hague Reparations Conference, scheduled to commence Jan. 3, 1930, and the London Naval Conference.

On December 28, however, M. Tardieu received a majority of only 45 votes on the question of the international bank plan. The Premier demanded and received full power to negotiate at The Hague a final accord governing the international bank. The Opposition charged that the Government had failed to provide sufficient national guarantees in the bank plan and that the International Bank represented an effort on the part of the United States to establish an economic hegemony over Europe. M. Tardieu, expressed surprise at this view, asserting that America's part in the international bank represented a valuable collaboration which Europeans could ill afford to lose. On the same day, the Chamber of Deputies adopted a five-year plan for the fortification of the eastern

frontier, providing for the expenditure of 3,300,000,000 francs on the fortification and aviation programmes.

French troops evacuated Coblenz and the second occupation zone of the Rhineland on November 30 in accordance with the agreement concluded at The Hague Conference. The third zone was to remain occupied until after the ratification of the Young Plan by Germany. Franco-German negotiations for the return of the Saar Basin to Germany were opened in Paris on November 21. Under the Versailles Treaty, the French were awarded "full and absolute" ownership of the Saar coal mines, until 1935, when a plebiscite was to determine whether the inhabitants wished to be annexed to France, to return to Germany, or to remain as at present under a Governing Commission appointed by the League of Nations and responsible to it.

The French made little headway in their apparent attempt to win over the people of the Saar, 90 per cent of whom were German, and abandoned hope that the plebiscite would result in annexation by France. The negotiations were inaugurated after M. Briand had agreed with the late Foreign Minister Stresemann at The Hague Conference that France would relinquish her claims to the Saar providing a satisfactory arrangement could be made for Germany's repurchase of the Saar mines, and for the continuation of the union of Saar coal with Lorraine iron.

On November 29, the government of the State of Prussia, which formerly owned the Saar mines, received unanimous parliamentary backing for its declaration that it would energetically oppose reported efforts of French and German industrialists to secure the mines jointly. The negotiations in Paris were adjourned December 20 "for the Christmas holidays," to be resumed Jan. 10, 1930. It was reported, however, that difficulties had developed over the method of payment for the mines, estimated to be worth over \$75,000,000. Germany, it was understood, demanded that she be allowed to make the payments under the Young Plan, while the French held out for a settlement independent of reparations accounts.

The Kellogg-Briand Peace Pact was ratified by the Chamber of Deputies on Mar. 1, 1929, with only the 12 Communists voting in opposition, and by the Senate on March 29, the latter vote being unanimous. The two-year controversy with the United States over the application of the American valuation system to French exports also was settled during the year. On December 13, Walter Evans Edge, the new American Ambassador to France, arrived in Paris. He was appointed to succeed the late Myron T. Herrick. Fear of the "Americanization" of France through American moving pictures led the Government to foster native films and to stipulate that American importers must purchase and show one French film for every seven brought into the country.

French relations with Great Britain appeared to have been impaired somewhat by the advent of the Labor government in Britain and by the stand of Chancellor of the Exchequer Snowden at The Hague. Relations with Italy remained none too cordial, although it was reported that negotiations had been resumed in an effort to settle all outstanding differences, particularly as to the status of Italians in Tunis and the delimitation of the frontier between Tunis and Tripoli. Fight-

ing broke out in Morocco again during the summer, and on June 9 a French detachment was overwhelmed and a post besieged in the central region of the Great Atlas Mountains. The Rif tribesmen, however, remained quiet.

A decree granting amnesty to Léon Daudet, Royalist editor who sought asylum in Belgium following his escape from the Santé Prison in 1927, and to Camille Renault and 11 other Communists jailed for political propaganda was signed by President Doumergue on December 30. Of especial interest to historians was the action of the French government in commencing the publication during the year of the official French documents on the origin of the World War, covering the period from 1871 to 1914. For developments in the Alsatian autonomist movement, see **ALSACE LORRAINE**, see also **REPARATIONS**.

**FRANKENFIELD, HARRY CRAWFORD** American meteorologist and official of the U. S. Weather Bureau, died July 29, 1929, in Washington, D. C. He was born in Easton, Pa., Nov. 24, 1862, was graduated in 1881 from Lafayette College, and received the doctor of medicine degree from Howard University in 1886. He was in charge of the U. S. Weather Bureau in Chicago (1887-94), transferred to St. Louis (1894), and subsequently to the bureau at Washington, where he was forecaster and professor of meteorology (1898-1920). He was chief of the river and flood service, 1898-1912, and again from 1920 until his death. To this work, his outstanding contribution was the development of numerical computations by means of which flood stages at various places could be closely foretold, days to weeks in advance, from the existing conditions upstream. His articles appeared in the *Monthly Weather Review*, and he was also the author of "Kite Observations of 1898," *Weather Bureau Bulletin F*, "Floods of the Spring of 1903," *Weather Bureau Bulletin M*, "The Ohio and Mississippi Floods of 1912," *Weather Bureau Bulletin Y*, "Floods of 1922," and "Floods of 1927." *Monthly Weather Review Supplements 22 and 29*.

**FREE BAPTISTS.** See **BAPTISTS, FREE**.

**FREMANTLE, ADMIRAL HON. SIR EDWARD ROBERT** An English naval officer, died in London, Feb. 10, 1929. Born at London, June 15, 1836, he attended Chesham School, Surrey. Entering the navy in 1849, he served in the Burmese War, 1852, and becoming lieutenant in 1857, and commander in 1861, he was in the New Zealand War, 1864-66. Appointed captain in 1867, he served through the Ashanti War of 1873-74, and being commissioned rear admiral in 1885, he was in the blockade on the east coast of Africa, 1888-89, and commanded the Vritu punitive expedition in 1890. He was commissioned vice admiral in 1890, and after commanding in China, 1892-95, he was made admiral in 1896, commanding at Plymouth until 1899. He was rear admiral of the United Kingdom from 1901 to 1927. Admiral Fremantle received numerous awards, including the first-class Order of the Crown of Prussia, and the first-class Brilliant Star of Zanzibar. Besides being a Companion of St. Michael and St. George, and a Companion of the Bath, he was created a Knight Commander of the Bath, 1889, a Knight of the Grand Cross of the Bath, 1899, and a Knight of the Grand Cross of the Royal Victorian Order, 1926. Admiral Fremantle wrote articles on naval subjects for various magazines, and his essay on naval tactics received the gold medal of the Royal United States Service Institution in 1880; he also

wrote the lives of Hawke and Boscawen in *From Howard to Nelson*, and *The Navy as I Have Known It* (1905).

**FRENCH CONGO.** See **FRENCH EQUATORIAL AFRICA**.

**FRENCH EQUATORIAL AFRICA.** A French possession in Africa on the Atlantic coast between the territories of the Belgian Congo and British Kamerun. Comprising the region formerly known as the French Congo, it stretches northward to the Bahr-el-Ghazel and Lake Chad, and is bounded by the Congo and Ubangi rivers in the interior. Area, 912,049 square miles, population, according to the census of 1926, 3,127,707, of whom 2502 were Europeans. The possession comprises the four colonies of Gabon, Middle Congo, Lower Congo, and Chad. The boundary between French Equatorial Africa and the Anglo-Egyptian Sudan was fixed by an agreement signed Feb. 28, 1924. In December, 1929, it was announced that the annual population deficit registered in the vital statistics of the colony had been eliminated. The decline was largely due to sleeping sickness, spread by the tsetse fly. In the four years from 1924 to 1928, French doctors and nurses in the colony examined 2,403,000 natives and treated 98,000 for the disease. In the same period, the medical budget increased from 2,500,000 francs to 10,750,000 francs annually.

Equatorial Africa is very rich in natural resources, for the most part undeveloped. There are about 30,000 square miles of tropical forests extending to the Gabon coast. The most valuable timber is palm oil and rubber. The principal commercial products are coffee, cacao, and cotton are raised to some extent. Livestock includes cattle, sheep, camels, horses, asses, and ostriches. Copper, zinc, and lead are to be found. Considerable quantities of ivory are exported. The total imports in 1927 were valued at 172,319,683 francs and the total exports at 136,747,844 francs (94,249,135 francs in 1926). In 1929 the general budget for the four colonies balanced at 54,500,000 francs. The revenues are made up of import, export, and excise duties, navigation fees, and certain semi-direct taxes. A governor-general whose headquarters are at Brazzaville has general supervision, but each colony is locally governed by a lieutenant-governor, aided by an administrative council. Governor-General in 1929, Rafael Antonetti, appointed in July, 1924.

**FRENCH GUIANA, GUAYANA.** A French colony and penal settlement on the northeast coast of South America. Area, about 34,740 square miles, population at the census of 1926, 47,341. Cayenne, a seaport town, is the capital with a population in 1926 of 13,036. The population figures do not include the number in the penal settlement of Maroni, in which there were 6000 prisoners on Jan. 1, 1928, the floating population of miners, French officials, or native tribes. In 1927-28 the school population, exclusive of Maroni, was 3500. The extensive forests are rich in timber of commercial importance. Only about 7000 acres are devoted to agriculture, the chief crops being rice, maize, coffee, cacao, indigo, manioc, tobacco, gutta-percha, and sugar cane. The chief occupation is placer mining for gold. Other minerals produced are silver, iron, and phosphates. The total imports in 1927 amounted to 61,641,424 francs and the total exports to 20,769,728 francs. The chief articles of export were gold,

rosewood essence, various timbers, phosphates, cacao, balata, and hides. The budget for 1927 provided for revenues of 11,000,000 francs and expenditures of 10,500,000 francs. The colony is under a governor who is aided by a privy council and by a council-general elected by French citizens in Guiana, and is represented in the French Parliament by one deputy. Governor in 1929, M. Maillet.

**FRENCH GUINEA.** A French colony on the west coast of Africa between Portuguese Guinea and the colony of Sierra Leone Area, 82,640 square miles, population, estimated in 1928, 2,185,697, including 2093 Europeans, of whom 945 were French. Capital, Conakry. The chief products are palm oil, palm nuts, gum, rubber, millet, rice, tropical fruits, and coffee. In 1927 there were 460,000 cattle, 125,000 sheep, 170,000 goats, 2400 horses, and 580 asses. Some gold is found in the colony. The imports in 1928 were valued at 106,115,000 francs and the exports at 72,174,000. The chief exports were rubber, cattle, groundnuts, hides, bananas, wax, wool, and palm kernels. The budget for 1928 amounted to 36,030,679 francs. The colony is under the Governor-General of French West Africa. See **FRENCH WEST AFRICA**.

**FRENCH INDIA.** The name given to the group of five French dependencies in India, of which the chief is Pondichéry Area, about 196 square miles, estimated population, Jan. 1, 1928, 287,193 (Pondichéry, 187,406, Karaikal, 37,488, Chandernagor, 25,830, Mahé, 11,706, Yanam, 4743). In 1927 the Government maintained 59 primary schools and three colleges, with 316 teachers and 10,514 pupils. In 1928 the budget balanced at 2,757,550 rupees (one rupee equals nine francs). The chief crops are paddy, rice, sugar, cotton, manioc, cacao, coffee, and groundnuts. At Pondichéry, there are three cotton mills and at " " " " one jute mill, the cotton mills have " " " " looms and 72,606 spindles, employing 7925 persons. Imports through the four chief ports in 1927 totaled 10,795,928 rupees, and exports, 28,630,790. Vessels entering and clearing the same ports in 1927 numbered 445. French India has 43 miles of railway. The dependencies are under a governor whose headquarters are at Pondichéry, and an elective general council, they send one deputy and one Senator to the French Parliament. Governor in 1929, R. de Guise (appointed in 1928).

**FRENCH INDO-CHINA.** A region in south-eastern Asia, comprising the French colony of Cochín-China, and the protectorates of Annam, Cambodia, Tonking, and Laos, as well as Kwang-chow-wan, which was leased from China, and the district around Battambang, which was ceded by Siam. Total area, about 285,000 square miles, population in 1927, about 20,700,000, of whom 31,443 were Europeans (excluding military forces). The population of Cochín-China in 1926 was 4,119,832, of Cambodia, 2,535,178, Annam, 5,580,974, Tonking, 7,401,912, Laos, 855,146, Kwang-chow-wan, 205,000. Hanoi, with a population of approximately 115,000, is the capital of Annam. Other important cities are Cholon, Bmldinh, Saigon, Phom-Penh, Hue, Vientiane, and Haifong. The region of which Saigon is the centre is chiefly agricultural, being one of the greatest rice-producing areas of the world, but fisheries along the coast and along the lakes are of some importance. Haifong is the centre of a region devoted to agriculture, mining, and manu-

facture. A third district around the port of Tourane produces chiefly cinnamon, sugar, and tea. In 1923 an irrigation system was completed, reclaiming 45,000 acres on which two rice crops a year could be produced. The rice export crop in 1928 was 3,063,000 pounds, valued at \$77,810,000, the total crop being about 8,000,000 pounds. Rubber production is expanding.

The mineral resources of French Indo-China include coal, zinc, tin, lignite, phosphate, tungsten, antimony, and wolfram. In 1928 the total mineral production was valued at \$9,276,000. The forest reserves are very important but suffer from inefficient exploitation. In 1927 imports totaled \$105,286,000 and exports, \$116,888,000, in 1928 imports were estimated at \$97,700,000 and exports at \$110,600,000. Cotton fabrics, machinery, rubber tires, silk fabrics, automobiles, sugar, and iron and steel manufactures were the chief imports and rice, crude rubber, coal, fish and shrimps, and pepper, the chief exports. Exports in 1927 went principally to Hong Kong, France, China, Singapore, and Japan in the order named, imports came chiefly from France, Hong Kong, Singapore, and the Netherlands East Indies.

The budget for 1929 balanced at 88,500,000 piastres (exchange rate of piastre in January, 1929, was \$0.4854). Preliminary estimates for 1928 placed receipts at about 89,500,000 piastres and expenditures at about 91,500,000, leaving a deficit of approximately 2,000,000 piastres. This was the first deficit in a number of years, the surplus in 1927 amounting to 6,560,000 piastres. The public debt at the end of 1928 amounted to 399,180,000 French francs (\$15,648,000). There were 1488 miles of railway line in Indo-China in 1928, two-thirds of it the property of the Government, which also owned the telegraph and telephone system. These had 23,020 and 17,380 miles of wire, respectively. In the same year, there were 19,758 miles of improved highways. A total of 2750 vessels of 4,045,060 registered net tons entered, and 2693 ships of 4,042,565 net tons cleared, the ports during 1927. Indo-China is under a governor-general and a superior council which acts through a permanent commission, and at the head of each state is a resident superior, with the exception of Cochín-China, which is directly under the home Government. Governor-General in 1929, Pierre Pasquier (appointed Aug. 22, 1928).

**FRENCH IVORY COAST.** See **IVORY COAST**.  
**FRENCH LANGUAGE.** See **PHILOLOGY**, **MODERN**.

**FRENCH LITERATURE.** One may consider as a *signe des temps* the vigorous protest launched by Julien Benda against the once more too easily accepted dogma that beautiful is synonymous with product of the young. In his little book, *Méanthes ou du beau actuel*, he develops the theory that "*La jeunesse ne constitue pas un titre en soi*", and he mentions Sophocles having written *Oedipus* at 90, Voltaire, *Candide* at 63, Goethe, *Faust* at 80, Wagner, *Parisfal* at 70. A similar idea is developed in *La fin de l'Éternel*, by the same author: we are on the way of killing the eternal truth by the relative truth.

More violent even than Benda against the slovenliness of modern artists is M. Ogenfant's little treatise *Art*. Eulogy today goes to the worst nullity provided it be new, let us *s'exprimer pied*. A great discussion raged regarding the status of the famous theatre, *Comédie Française*. The outcry was that the great national

stage is decaying, and many suggested the name of Jacques Copeau to replace the director Émile Fabre (Copeau was the well-known stage reformer of the former Colombine Theatre (see *Nouvelles littéraires*, July 6, 20, etc.).

Geneva and the League of Nations were much discussed by men of letters. Robert de Traz in *L'Esprit de Genève* tries to show that Geneva was fatally destined to become the home of the League of Nations, Calvin having opposed the individual conscience to the hierarchy of force, in this, he was working along the same lines as the reformers in the British Isles: what we call the Anglo-Saxon ideal; there was the part in modern thought also played by Rousseau, the author of the *Social Contract*. The satirical note, however, is not lacking, and many were looking forward to a play by the very witty Robert de Fleis and Francis de Croisset (the first having died, only one act was produced), not only was the League itself hit, but especially the numerous ladies that swarmed about the place, "having renowned men to dedicate themselves to mankind", the *Précieuses de Genève* was to be the title. Much more sarcastic was the attack by the venomous René Benjamin in *Les Augures de Genève*. The same author had an unpleasant affair brought upon him by his public remarks about a powerful member of the literary guild, in *Sous l'œil en fleur de Madame de Noailles*.

POETRY Among a number of publications in 1929 were the *Œuvres complètes*, by Baudelaire, the beautiful *Testament d'un Latin*, by Pierre de Nolhac, of the French Academy, his years conservateur du Musée Versailles, Francis Jammes's charming poems in prose, *Les nuits qui chantent* (compared his *Pensées des jardins*). Friends collected the works of Léon Deubel, who had committed suicide some years previous leaving some stirring poems (*Eurres*, *Mercur*). André Rivore, one of the most classical of present-day French poets, had *Le Désir et l'amour*. Jean de la Ville Muiant's *L'horizon chimérique* reminds one of Baudelaire, while Chesnelong's *Orient*, recalls Iliad, and Véra's *Bara*, Gantier's impeccable lines. Louis Chadourne sings in *Les accords* and Pierre-Jean Jouve (author of the mystic *Pauline*) in *Le Pardu perdu*, which takes up the theme of Vigny's *Eloa* and Lamartine's *Hôte d'un ange*.
